The so-called terrible despot and dictator of Germany, called "The Kaiser,"—a name which at once arouses all sorts of imaginations in the heads of the readers of foreign newspapers,—is nothing else than a man in this world who has the highest possible ideas of life and especially of his duties in the position in which he has happened to be placed. Newspaper men, and not by any means only American ones, have woven a legend around him which is surprising but not always flattering for the Emperor, as well as for Germany. Sensational the newspaper reports must be; otherwise the readers are not satisfied. The best I can express for the United States is: May American Presidents always be such able and high-thinking men as is the German Emperor.

The German military party! I did not know that such a party existed in our country till foreign newspapers told me so; therefore I am sure there must be one. This powerful party, with the Emperor at its head, dominates everything in Germany,—so you say. I know a very powerful German Army and a very powerful German Navy; a dominating military party I have not known. Call it military party if you like; I should call it a very wise Government, which did its duty and hence foresaw that one day French ideas of revenge, coupled with the ambitions and corrupt zeal of Russian Grand Dukes, and, last but not least, whipped up by the low political and commercial jealousy of England, would force us into a war for our existence.

Were I to go further into the so-called stratification of German society into classes which are subordinate one to the other, I must admit that I know nothing about it. But what I do know is, that the different classes have through intelligent working with the Government practically eliminated poverty from Germany.

I advise you to study our laws about Government insurance, our municipal laws regarding poverty taxes. I am sure that if you should go through these and then could see them working in practice, you would admit that you have known very little about Germany before. Some years ago, a friend of mine from Liverpool,—an unusually broad-minded and well-read Englishman, who at home took a great deal of interest in municipal affairs,—visited me for some time. He asked me to show him the institutions and to explain to him the working of our system of providing for the poor, which I did with pleasure. He was perfectly astonished about what he saw and heard, and particularly because he could not find any real poverty in Bremen and other parts of Germany. He told me many times afterwards what a difference there was in this respect between England and Germany,—in the one country, poverty and drunkenness among the lower classes; in the other, happiness and order even in the smallest hut, and the poor, if any, looked after not only by the Government, but also by individuals of all classes.

This is the way the country really looks, which you imagine

divided up in classes and its people down-trodden by their superiors worse than are the people of Russia:

It is the country in which, on the memorable Fourth of August, 1914, the Kaiser addressed the members of the Reichstag in words as frank, as beautiful and as true as ever a ruler has spoken to his people; and where the leaders of all parties without exception promised the Emperor to follow him through thick and thin.

It is the country where, in the first five days, two million men of all classes volunteered to join the army,—men who were free of military service altogether; when the college professor of sixty and the millionaire volunteer to fight as privates shoulder to shoulder the one with his students and the other with his workmen.

It is the country where within a few days a thousand and a half million dollars of the German war loan were taken by the people of all classes; and where the same amount could be had again and again at any time, if necessary.

It is the country which looks to-day as if it was enjoying full peace; where the farmer has prepared his fields for the next crop; where spindles and looms are running; where business is almost going on as usual.

I ask you whether this would be possible in such a country as you picture?

I have spoken already about the wall, which is not one that the Germans have put around their country, but one that other nations have erected between themselves and Germany. Is this the fault of Germany and the Germans?

There is, however, another reason for the loneliness we enjoy at present in the world and which is entirely our fault. I am sending you enclosed all the reports about the progress of the war given out since the beginning by the German military headquarters. You will admit that all of them together would not fill a single page of an American newspaper; but you will also admit that every word in these reports is true.

I have read American and English newspapers since the beginning of the war, and it is marvelous what the Allies are accomplishing every day according to these newspapers. Poor Germany, where would she be, if all this were true? The German accounts take a very small space and are dull reading; they certainly would not occupy the time while going down town in the morning. The English, French and Russian accounts are certainly much more interesting. The English commander runs with the whole English Army as fast as he can for days before the German troops. The most wonderful military success ever accomplished! The Russians are beaten and driven into the swamps. How many are killed nobody will ever know, but 92,000 unwounded prisoners are taken by the Germany Army. Still, the Russians have done wonderful work to hold a German Army in the East occupied so long! Here are a few head-lines of American newspapers: "Brussels Reported Recaptured by Anglo-Belgian Army"; "Joffre Reports Five-Day Battle a Decisive Victory"; "Russians Hold 180,000 Austrians Trapped in the Marshes."

You will ask: "What do you mean by all this?" I can give you a very clear answer. The German Government has made a terrible mistake in these last years, since Germany accomplished the development of her country at home and came to wish to be listened to outside. The German Government has underestimated the power and influence of the press. It is of no use to say that the truth wins in the end; it does not now-a-days. The countries of the world and their peoples have to be brought to your way of thinking,—no matter by what means, so long as you accomplish it. That is the theory of the diplomats; and the thing can be done only by a worldwide organization and by means of the press. We I wonder if we can change our character to such an extent as to become diplomatically modernized. I doubt it!

Hobson did a brave act in the Spanish war,—to our way of thinking, only his duty. Admiral Dewey sank a few old Spanish ships. The world knows these men as great heroes. Why? The press!

Russia assists her allies in a most wonderful way by occupying Germans have been too honest, too modest to use such means; and part of the Germany Army. Why? The press! General French runs as fast as his legs can carry him from the Germans. He is a great general, because he managed to save part of his troops through this unprecedented race. Why? The press! And the Germans did absolutely nothing! Hindenburg is no General in spite of the 92,000 unwounded prisoners! The commander of the small island steamer, the "Königin Luise," who practically stopped the trade on the East coast of England did nothing! The German troops marched, fighting against three armies, through Belgium and France to Paris in almost less time than a tourist could walk that distance in his Summer holidays,—but that is natural! Why must all this be as it is? The press!

If, following the examples set by our neighbors, our reports of the war had spoken of the wonderful heroism of our officers and men, with descriptions covering the smallest details, thus making the reports interesting to the reader and filling a newspaper, we Germans should to-day be the most wonderful nation on earth. By means of working over long years through the press all over the world, I am sure we should have won the sympathy of the world in our favor. That chance we have missed. As it is, arms must decide the battles and at the same time the future of the different countries engaged in the war. After Germany has dictated its own peace terms in London, Paris and St. Petersburg, we can consider whether it is still necessary for us to court the press of the world. We were not believed to be the peace-loving nation we claimed to be; the word of our Emperor was not taken seriously; because our enemies for their own purposes wanted to make the world believe differently. And in this they succeeded only too well.

One word on a different subject before I close. What position are the United States taking in this war? England is in the most remarkable way keeping the exports from America back. The South has to hold its cotton or sell it at ruinous prices, because England wishes it. A Yellow Race is turned loose on the whites, because England needs help. At the moment, America and the rest of the world do not care for the danger to their own interests.

Can it be fear of England? Or are all these interests small in comparison with the hope of civilized mankind that Germany may be defeated? Yours very truly,

C. ALBRECHT.

Bremen, Germany, October 6, 1914.

[The writer of the above letter is one of the most respected cotton merchants in Bremen, widely known in the cotton trade, not only in Germany, but also in England and in the United States. The extent and thoroughness of his training in his business and the very nature of the business itself have given him a cosmopolitan, rather than a narrowly German outlook. He has observed widely and thought deeply. Moreover, he is a representative of the great class of independent German merchants, unallied with the powerful groups of industrialists and bankers whose impressive influence upon German polity has appeared to us, here at a distance, so striking a feature of the modern German Empire, as it has developed during the reign of the present Deutscher Kaiser. He can therefore speak for the solid business class of Germans, which dur-

ing the past generation has been steadily at work upbuilding the extraorinary economic fabric of the Empire and which in an economic, if not in a political, sense has been making for the Germans that "place in the sun" which has excited the admiration, much more than the jealousy, of the world. All his deliberate opinions are entitled to weight; and his opinion about the justice or injustice of the editorial in this paper, to which he refers, is in our eyes entitled to very great weight. And this is the more the case inasmuch as, we believe, his voice, in the matter of Germany's way of looking at the dreadful war in which she is now involved, is to all intents and purposes the voice of the substantial and truly creative part of Germany.

Our correspondent is wrong, however, in assuming that we wrote about the world's and America's judgment of the German cause, ignorant of Germany and of the German tongue, and hence dependent upon second-hand information derived from English accounts of the German nation and its achievements or defects. At the risk of intruding a personal concern, we must tell him that it is now over forty years since we took our first lessons in the German tongue, and that in no year since the beginning have we failed to be occupied with what Germans have written. Perhaps we may venture to say that few business men in Germany itself have had occasion to study so much the beauties of German literature. We have, for instance, spent many days and nights in the study of the German poets of the Middle Ages; and we have allowed ourselves some pride in the extent of our *collectanea* about Walther von der Vogelweide, to say nothing of Wolfram von Eschenbach, Gottfried von Strasburg and the rest. We have followed, too, the evolution f the German speech,—so pellucid, so hospitable, so fitted to be a world language, as Walther von der Vogelweide used it; then becoming Ciceronian, periodic and lumbering in the mouths of the German humanists of the 14th and 15th centuries; and finally under the Pan-Germanic influences of our own day turning averse to accommodation with all other languages, priding itself upon its Teutonic exclusiveness and growing to be "a great wall around Germany and the Germans." But apart from the German language, we have spent some years with the German philosophers, Kant and Hegel, Schopenhauer and Fichte. In this field we have been unable to bring ourselves to the serious study of Nietzsche alone,—no calm thinker, but a shallow romanticist in the guise of a philosopher. Nor is Goethe alien from us, nor the German poets of his time. And we have lived long also with the German men of science, —in our earlier years with the classical philologists and of late with the political economists and political historians. We need not speak of Otfried Müller and Niebuhr and Mommsen, but may mention instead Wagner and Treitschke. In the field of social or workers' insurance, too, we have some first-hand knowledge of what Germany has done. In this very paper we have published translations of articles upon German Arbeiterversicherung by Professor Dr. Alfred Manes, General Secretary of the German Association for Insurance Science, and by Ministerialrat Dr. Friedrich Zahn, Director of the Bavarian State Statistical Office, and others. We subscribe to and read regularly the "Amtliche Nachrichten des Reichs-Versicherungsamts"; and we receive every week a half dozen or more of German economic and insurance journals.

We do not think, therefore, that our correspondent can justly charge us with having written about Germany with only second-hand information to guide us. But it were impertinent and vainglorious to say what we have of our own familiarity with things German except for the purpose of bringing out the fact that all through the United States there are many who have an even superior first-hand knowledge. Our universities are full of them; and, strange as it may appear to our correspondent, great numbers of them are to be found on the staffs of our newspapers and of all our serious journals. It is not true that what is said of Germany and the Germans in our press is uncontrolled by real knowledge. Many very foolish things may be found there, no doubt; and the writers of head-lines are not hired for their knowledge, but for their command of the startling and attention-catching phrase. But this chaff is quickly blown away, leaving nothing behind. What remains, the real and permanent body of information about Germany that circulates through the columns of our press, has been tested and approved by men who know the sources of what they say. More than this, if fault is to be found with this information, it is that it is in general too sympathetically and enthusiastically given out. Thus, what has been published in the American press about German social insurance treatment of poverty, workmen's house building, and similar social provisions, has contained hardly a word about the social disadvantages of these great German institutions, as these disadvantages have been brought out by German writers themselves,—e. g., Dr. Friedensburg, formerly president of a Senate in the German Imperial Insurance Office; Professor Ludwig Bernhard, of the University of Berlin; and more than one considerable figure in German industry and trade.

Our correspondent must not think, then, that it is either a prejudiced or a fundamentally misinformed America whose general opinion about the larger issues of the great war in which Germany finds herself engaged, was reflected in the article in this paper which he criticises. It is, however, an America deeply democratic by conviction; which believes profoundly in a Government "of the people, by the people, for the people," as the wisest of all our statesmen, Abraham Lincoln, put it; whose abhorrence is great for any forward movement in the world of the principle of autocracy or of oligarchy or of any form of government except one of laws, not of men. And this America, though it feels the deepest gratitude for what it has gained from German literature and philosophy and science, on the one hand, and the greatest admiration for German achievements in industry and commerce in recent years, on the other, has for some time past been catching glimpses of a different and, in its opinion, far from beneficent order of thinking and doing in Germany. It has not seen what good could come to the world at large from the propaganda of Pan-Germanism in all its various forms. It has found something selfish and aggressive and barbaric in the fundamental conceptions of what German polity should strive for, as these conceptions are elaborated in the works of an economist like Wagner, an historian like Treitschke, or, more recently, a military writer like General von Bernhardi. The extraordinary outpouring of German books on war and all that concerns war has amazed and chilled the sympathy of this America, as has also the general acquiescence of Germans in the arrogance of their soldiery. And beyond all this, the more and more frequent utterances which reach us, of Germans high in authority who assert for Germany a kind of monopoly in the modern world of efficiency and race soundness and "Kultur," giving an implied divine right of imposing the hegemony of Germany upon the other decadent nations, cause the America that owes so much to Germany and gladly acknowledges the debt, to find something dangerous and menacing in Germany's political assumptions and to feel that its own welfare requires the defeat of these assumptions. When Prince von Bulow says to the Norwegian Bjorn Bjornson, as he recently did, that: "If the German nation should succumb to the powers fighting her now, that would mean the doom of the morale of the world," America is not merely astonished at the amazing distortion of the truth, but also instinctively roused to defense of the whole order of things for which she stands. For, whatever may be argued in favor of the German social and political system, it is obviously

antipodal in conception to that which America has inherited from the past and hopes to maintain for the future.

This rejoinder to our correspondent's letter is already too long to permit us to take up in detail other matters he mentions, such as the tendency to class stratification in Germany. Of this we can say here only that we find our justification for the assertion in more than one recent writer of Germany itself. The existence of the thing known as "Hoffähigkeit" (right to frequent the Court) at the top of German society may serve as one illustration. Another, at the lower end of the social order, is the position taken not so long ago in a public address by one of the masters of the German steel industry that, inasmuch as the migration of workers from establishment to establishment is an impediment to the efficiency of industry, legislation should be enacted to compel those of the working class, once placed, to remain where they are, so long as their services are needed by their employers.

In conclusion, we would say that we do not believe that any use of the press such as our correspondent seems to have in mind would have made or would make in the future the difference with regard to sympathy or the lack of it towards Germany which he imagines. At least, it would not in a country imbued with the notion of the freedom of the press, as is the United States. We are willing to admit almost any criticism of our newspapers that one may choose to make of them; but they are free, they cannot all or many of them be controlled, and their often over-hasty graspings at and approximations to the real truth do as a rule gradually allow that truth to emerge. We do not think any thinking American at this moment fails to understand in the main the magnificent courage, efficiency and self-devotion of the German army, or to know of the German victories and the results they have brought for the German arms, or to apprehend the existing military situation. In spite of the often sensational and misleading headlines, we have no doubt of the accuracy of what we have just said. But American sympathy will be won by Germany not by a display of unheard-of preparedness for war, but rather by the abandonment of those pretensions to a divine right of world hegemony which we now feel she is endeavoring to impose upon Europe by force of arms. Germany, whatever she may have achieved, is not the divinely appointed depositary of the "Kultur," of the "morale," of the modern world. She is great in a thousand ways,—noble in her achievements and splendid in her energy,—but there are other "cultures," other systems, quite as important to the world as hers.—Editor.]

THE WORK OF THE AMERICAN RED CROSS

THE Red Cross needs no apologist. Its position in our community is assured, and the principle of non-partisan service which underlies it is recognized in every corner of the world. Since the outbreak of the war in Europe, however, the Red Cross has been constantly in the public eye. Subscriptions to aid its work have been made and announced daily in the newspapers. A ship under the Red Cross flag has recently returned from a voyage to European ports to carry doctors and nurses and relief materials to the wounded. Stretchers and hospital clothing were sent last week to Russia. It is now announced that appeals for assistance from Mexico have been forwarded to the Washington headquarters of the society through Rear Admiral Howard, and that reports are at hand which indicate considerable suffering in China and in Turkey.

It must be apparent that the opportunities for service which come to the Red Cross are almost without limit. And it is certain that, if the European War continues through weary months and perhaps even years to render its toll of sufferers, the financial needs will always lag far behind the requirements. It has appeared to us, in consequence, that anything which can be done in the way of placing intelligent information regarding the activities of the Red Cross before the public, whose agent it is, and upon whose bounty it must rely for the realization of its full usefulness, must be of far-reaching value. It is a pleasure to be able to present the facts here set forth from information very kindly supplied by Mr. Charles L. Magee, Secretary of the American Red Cross, in Washington, D. C.

The original idea underlying the Red Cross is contained in a recommendation of the International Conference of Geneva, held in 1863, as follows: "That there exist in every country a committee whose mission consists in co-operating in times of war with the hospital service of the armies by all means in its power." Definite status was given to organizations of the sort suggested, at the Geneva convention of 1864. And the Geneva convention of 1906, which was held for the purpose of revising the treaty of Geneva, commonly called the Red Cross Treaty, further confirmed their establishment.

The enlargement of the scope of service from the alleviation of human suffering in war times to include similar service in time of peace was brought about through a natural process of evolution. There was obvious need of a trained organization to render assistance after great disasters. And it was soon recognized that the societies which gained efficiency through conducting relief and preventive measures in peace times were best prepared to cope with the unusually heavy needs in time of war. This fact was recognized by Congress in the Act, approved January 5, 1905, incorporating the American National Red Cross, in which its purposes, in addition to duties in time of war are declared to be: "To continue and carry on a system of national and international relief in time of peace and apply the same in mitigating the sufferings caused by pestilence, famine, fire, floods, and other great national calamities, and to devise and carry on measures for preventing the same." It is of passing interest that the Act forbids the use of the "Greek Red Cross on a white ground" by any private commercial or charitable institution, unless such institution had used the emblem prior to the passage of the Act.

The organization of the society consists of a Central Committee of eighteen, the chairman and five members of which are appointed annually by the President of the United States, to represent the Departments of State, War, Treasury, Justice and Navy. Six members are elected by the Board of Incorporators, and the remaining six by the delegates to the annual meeting. A sub-committee of seven acts for the Central Committee, through three sub-divisions, the War Relief Board, the National Relief Board, and the International Relief Board. The Red Cross is required by law to render an annual report, through the Secretary of War, to Congress, which has it printed as a public document; and an annual auditing of its accounts by the War Department is also prescribed. The usual officers are elected annually; and, in addition, a National Director, or general manager, is chosen to supervise and direct every phase of the society's work for the Central Committee.

It is assumed that the public will always be willing to contribute for the relief of suffering. But Congress wisely provided a fund, the income of which is available for the permanent support of the organization, to maintain its efficiency as a going concern, and to meet the numerous minor relief appeals which are constantly being received.

One of the most interesting special departments of the Red Cross is that of First Aid, which was established in 1910. It is operated under the direction of an officer of the Medical Corps of the United States Army, who is assisted by a staff of physicians

available for detail as instructors in mines, lumber camps, railroads, and all organizations employing industrial workers, and the police and fire departments of cities. This department now includes a life saving corps for "Water First Aid." Persons who have been instructed by the First Aid Department are expected to assist the Red Cross in time of war. Under this department, also, has been developed a splendid organization of nurses, in co-operation with the American Nurses Association, the largest organization of trained nurses in the world. State Red Cross committees have been appointed, and a high standard of ability is required for nurses enrolled in the service, which now consists in thirty-six State committees and ninety-four local committees. Approximately 600 nurses are serving without pay on these committees, and through their efforts over 4,500 nurses have been enrolled for service under the Red Cross. Through the nursing service the society has undertaken the broad purpose of carrying into the homes of the people a better knowledge of the principles of health, especially those involving the prevention of illness. It is planned to carry this work, by means of the organization of classes of instruction for women, into the most remote regions of the country. The nursing service is typical of the whole Red Cross system in that it emphasizes the purpose of co-operation which underlies it. It must be obvious to any one that the needs of the entire country could not possibly be met by the physical or financial resources available to any single organization. Thus, a constant endeavor is made, through a thoroughly trained organization to teach the people how best to meet, through their own endeavors, the constant dangers which threaten their health in ordinary times.

Obviously, in time of disaster an organization highly efficient and immediately available is of far greater necessity. Each great calamity presents its own problems; and system and training are almost essential to their best solution. As an instance of this may be cited the circumstances surrounding the great storm at Key West in 1909. We quote the following from an official Red Cross pamphlet:

"Many of the sufferers were fishermen, whose loss consisted in the destruction of their boats. This loss entirely deprived them of a means of livelihood. The Red Cross solved the problem by employing them to rebuild their own boats. They were paid daily wages and were thus enabled to provide for themselves and families. As soon as the boats were completed, the daily wages ceased and the fishermen resumed their usual occupation. The principle involved in this instance is capable of a wider application in emergency relief operations."

"While great advances have been made," the pamphlet continues, "in methods of charitable assistance among the permanent agencies of charity in the larger cities, the equally important work of disaster relief, because of its incidental and transient character and the widely separated fields of its occurrence, has been left too often to the administration of hastily formed committees of inexperienced persons. The Red Cross stands ready to place its experience and organization at the service of any community so crippled by disaster that it is unable to cope with the problems of relief and rehabilitation with which it is confronted."

In conclusion it may be of interest to glance back at some of the recent work of the Red Cross in emergency relief. It appears that there have been since 1905 over seventy-five disasters caused by earthquakes, volcanic eruptions, fires, floods, famines, mine explosions, and wars, in this country and abroad, for the relief of which the society has expended or directed the expenditure of approximately $12,000,000. A tabulation of the principal disasters of the past ten years and the amount expended by the American Red Cross in connection with each is given below:

RELIEF WORK OF AMERICAN RED CROSS, 1905-1914.

Year.		Amount Expended. Cents Omitted.
1905	Philippine typhoon	$1,150
1906	Japanese famine	245,855
	Vesuvian earthquake and eruption	12,759
	San Francisco earthquake and fire	3,087,469
	Valparaiso earthquake	12,353
	Gulf States storm	671
1907	Chinese famine	325,725
	Kingston earthquake	5,699
	Russian famine	9,000
1908	South Carolina and Georgia floods	642
	Mississippi cyclone	960
	Monongah mine disaster	3,782
	Chinese flood (Canton)	2,000
	Canadian forest fires	1,000
	Michigan and Minnesota forest fires	300
	Italian earthquake	985,300
	Cyclone, Clinton, Mich	6,245
1909	Monterey flood	8,707
	Portugal earthquake	1,300
	Cherry mine disaster	97,247
	Turkish Armenian relief	30,500
	Key West hurricane	1,140
	Tokio flood	5,000
	Nicaraguan sick and wounded soldiers	3,776
1910	Mulga mine disaster	12,531
	Servian flood	490
	Costa Rica earthquake	9,050
	Paris flood	44,942
	Idaho forest fires	1,046
	Chinese famine	251,677
	Minnesota forest fires	95,114
1911	Manchurian plague	2,711
	Michigan forest fires	2,500
	Austin flood	1,891
	Taal volcano (Philippines)	16,050
	Mexican soldiers	7,307
	Albanian refugees	1,000
	Stamboul fire (Turkey)	500
	Hankow flood	1,000
	Persian destitute	1,500
	Colon fire	5,901
	Washington Place factory fire (New York)	70,000
1912	Ted mine disaster (West Virginia)	500
	Balkan War	75,631
	Titanic wreck	125,993
	Washington Place factory fire (second payment)	37,048
	Mississippi flood	27,486
1913	Relief incident to Mexican insurrection	20,451
	For fire sufferers, Hot Springs, Ark	1,042
	Texas flood sufferers	5,000
	Kentucky flood sufferers	500
	"Cincinnati" mine disaster, Finleyville, Pa	659
	Care of sick and wounded at Gettysburg Veterans' Reunion	4,403
	Nome, Alaska, storm and flood relief	500
	"Volturno" steamship disaster	5,000
	Mississippi River flood relief	20,000
	Grecian Balkan War relief	4,957
	Servian Balkan War relief	1,618
	Turkish Balkan War relief	3,002
	Bulgarian Balkan War relief	469
	Ohio and interior storm and flood relief	2,472,287
1914	Texas flood relief	10,585
	Relief of destitute Turks	1,009
	Japanese famine and volcanic disaster relief	10,500
	Relief incident to Mexican revolution	8,412
	Newfoundland sealing disaster	5,000
	For study of flood and famine prevention in China	2,578
	Mississippi River flood relief	5,000
	Second Balkan War relief, Bulgaria	18,000
	Ohio and Interior flood relief	23,465
	Chinese River conservancy work	75,000
	European War relief (expended and obligated for)	288,000
	Salem fire	625,000

During this period $1,800,000 additional was raised through

sale of Red Cross Christmas seals and applied to the relief and prevention of tuberculosis.

It is apparent that the society has assumed an important place in this country. Its work is of a sort which is never finished, and which must be skilfully and promptly done. That it has been so well done up to this time must be a source of satisfaction to students of American institutions.

INDUSTRY, COMMERCE AND FINANCE

The Bank of the Argentine Nation.—In the first number (October 1, 1914), of the new publication, "The Americas," issued by the National City Bank of New York, appears an account of the Banco de la Nación Argentina, at present the most important national central bank, or bank of issue, in the world except for those of the greater European countries. Inasmuch as the National City Bank of New York has arranged recently an exchange of credit with this South American institution, the article is authoritative. It is as follows:

The Banco de la Nación Argentina is of special interest to the student of banking systems in North America, because its organization is based in theory upon what we know as the central bank plan. It is composed of a single institution at the centre with numerous branches, maintaining a large metallic reserve, each member supporting the others by rediscount. It was founded upon this plan in the year 1871, and has proved so satisfactory and efficient that to-day it is an institution with a capital of $128,000,000 national currency, which is equivalent to about $53,760,000 in terms of United States money. It has approximately 150 branches or succursales which are distributed in Buenos Aires and in every part of the republic from the Province of Jujuy in the north to the Province of Tierra del Fuego in the south. During the year 1913 it established ten new branches, and had at the time of its last annual report in February, 1914, under consideration the establishment of new banks at about ten additional points.

The business of the bank is varied. It discounts commercial paper, makes advances upon securities and other non-commercial assets, issues paper money, and accepts savings. It does not lend money upon real estate, as that function is exercised by the great mortgage banks of Argentina. It is the official government institution, with directors who are nominated by the government and is authorized to make loans to the national government and to no other. These loans may be made to the extent of 20 per cent of its capital. In accordance with what is known as the Conversion Law the bank is required to deposit a conversion fund in gold to which the National Government contributes out of its revenues. This gold [illegible] the paper currency in circulation previous to the passage of the Conversion Law. On December 31, 1913, it amounted to $876,464,495 national currency.

The total resources of these banks were in 1911 [illegible] in 1913, $876,464,495, which by the year 1911 [illegible] as follows: To head office, [illegible]; total $876,464,495.

As regards the annual balance of the bank, the following will be considered of interest. [illegible] $85,573,- 501 drafts issued and [illegible] deposits; while in 1913 they [illegible] $215,259,969. The [illegible] $82,711,139 and in 1913, $215,259,969. The [illegible] of December 31, 1913, showed its cash to be [illegible] and $180,647,047 in papa per. Deposits at the [illegible] $71,181 in gold and $139,123,321 in paper. [illegible] $1,881,623 in gold and $115,129,677 in paper. The reserve was $11,063,107 in gold. It will be seen that the cash in hand maintained by the bank has been considerably larger than the law prescribes, and has averaged 39.35 per cent of its deposits throughout the year 1913.

* * *

The Preliminary Figures on Income Tax Returns.—The Treasury Department has issued a statement covering the number of persons who paid income taxes under the provisions of the Underwood Act of 1913. The amounts collected from each class have not been made public. The number of taxpayers in each class, however, is stated, and in each case it is lower than the Treasury estimate submitted by Mr. Underwood to Congress with the completed draft of the tariff and income tax bill in 1912. This fact will appear from the following table:

ACTUAL AND ESTIMATED NUMBER OF INCOME TAXPAYERS IN THE UNITED STATES, 1914.

Income.	Estimated No.	Actual No.
$2,500 to $3,333	.....	79,426
4,000 to 5,000	126,000	114,484
5,000 to 10,000	178,000	101,718
10,000 to 15,000	53,000	26,188
15,000 to 20,000	24,500	11,977
20,000 to 25,000	10,500	6,187
25,000 to 50,000	21,000	11,144
50,000 to 100,000	8,500	3,166
100,000 to 250,000	2,500	1,241
250,000 to 500,000	550	226
500,000 to 1,000,000	350	91
1,000,000 and over	100	44
Totals	425,000	357,598
Subtracting $2,500 class, not estimated for		79,426
Actual taxpayers in classes estimated for		278,172
Excess of estimated number over actual		146,828

It will be observed that the total actual number of taxpayers is only 65.4 per cent of the estimated total. In the Treasury estimate above referred to the probable Government income under the Underwood tariff was set out, and a deficit was shown, as compared with the net Government income for 1912, of $68,790,000, to be cared for by the income tax. If the percentage of the total revenue collected from the tax has fallen below the estimate in the same ratio as the number of taxpayers has declined from the number expected, the total must be approximately $44,988,660. To this must be added the amount collected from incomes between $2,500 and $3,333, which was not included in the estimate. This class, at 1 per cent, may have yielded $2,250,000, which would bring the total to approximately $47,240,000. These figures, of course, are upon an annual basis. The actual tax collected was for the ten months beginning March 1, 1913. The percentage of income taxpayers to total population in the United States is approximately .36.

Figures covering the number of income taxpayers abroad are not generally available. In the United Kingdom in 1912, there were 1,177,872 such taxpayers, or 3.9 per cent of the total population, all incomes under $800 being exempt. In Austria, where all incomes are taxed, 1,538,652 persons paid an income tax in 1912, or 16.33 per cent of the total population. It is of interest that out of this number, 1,497,746 were taxed on incomes below the amount at which our tax begins. This leaves only 45,906 persons within the taxable classes specified in our own law, as will be seen more clearly in the following table:

AUSTRIAN INCOME TAXPAYERS BY INCOME GROUPS, 1912.
(In round figures on the basis of krone = 20 cents.)

Income.	No. Taxpayers.	Income.	No. Taxpayers.
Below $260	702,803	$2,400 to $8,000	38,977
$260 to $720	548,669	8,000 to 40,000	6,302
$720 to 1,440	194,039	Over $40,000	627
$1,440 to 2,400	52,175	Total	45,906
Total	1,497,746	Grand total	1,538,652

The total amount collected in Austria under the scheme out-

(Continued on Page 576.)

INSURANCE

THE action of the National Board of Fire Underwriters, at its meeting on Thursday of this week, in adopting and making effective resolutions looking to a country-wide accumulation and compilation of experience in the great field of fire losses, must be regarded as of the first importance in more than one respect. As everybody in the fire insurance business knows, the in itself entirely reasonable and indeed in the highest sense obligatory movement of those entrusted by the public with the supervision of insurance, to obtain adequate data with regard to the actual fire loss experience of the country, excited much opposition and not a few real animosities, because the first impulse of the Insurance Commissioners who broached the matter was to turn to the most obvious sources of information, i. e. the private records of the fire insurance companies. Demands were made upon these companies, purely private enterprises though they were, to expose to the Commissioners and through them to their competitors and to the public all the interior methods and practices of their business. Of course, such disclosure of the results of private initiative, ability and knowledge was resisted, and for a time it appeared as if a far-reaching and possibly very harmful controversy might result from the clash of opinion and utterance of insistant Insurance Commissioners, on the one side, and fire insurance managers convinced that their dearest rights were being invaded, on the other.

Through it all, however, it remained true that it was not well for the country with its enormous annual fire loss, to have no general collection of ascertained facts about fires and no gradually enlarging fire loss experience, to serve as a basis for all the public activities which are more and more concerning themselves with fires and with insurance against fires. It was not even well for fire insurance itself that the largest and soundest knowledge about it and its subject matter, fires, should be confined to the heads of more or less isolated individual fire underwriters, instead of being a transmissible body of tested experience, capable of being used by generation after generation of fire underwriters, without the necessity that each of these underwriters should virtually have to learn the entire subject for himself. It is, of course, true that in the heat of the controversy with the urgent Insurance Commissioners, many fire insurance men took the ground that there is no such thing possible as a fire loss experience which can be trusted as a guide in practice. According to these extreme arguers, fire insurance is totally devoid of experience in the scientific sense (though fire insurance companies carefully record their own), but rests upon a kind of trained intuition. This theory makes the successful fire underwriter in essence an artist, following no rule derived from gathered facts, but rather some sixth sense of his own.

It is improbable that anybody took this contention very seriously, even in the fire insurance circles most determined in their opposition to the demands of the Insurance Commissioners. Reasonable men on all sides saw clearly enough that a combined fire experience of the United States (and Canada) was highly desirable, if there was any way of obtaining it, without passing beyond the bounds of public right in respect of disclosing the really private concerns of business enterprises like the fire insurance companies. There is a place for individual ability and for success obtained through individual ability in the conduct of fire insurance; and the public is no more entitled to a knowledge of the secrets of the results obtained by this ability in fire insurance than in any other business. But, on the other hand, there is a certain body of knowledge necessarily accumulated in the conduct of a fire insurance company which cannot be said to have any quality of privacy about it. This the public may fairly ask to have contributed to the common store of knowledge, in order that all may have the benefit of it.

The plan just adopted by the National Board of Fire Underwriters for the creation of a new department, to be known as the Actuarial Bureau, to which all the member fire insurance companies and as many non-member companies as are willing so to do, may report their fire experience in a systematic and uniform way, so that it can be compiled in truly scientific form, promises to yield all the results aimed at by the earlier efforts of Insurance Commissioners to compel the insurance companies to disclose the details of their business, without violating any private rights whatever. The endorsement of the plan by the Fire Marshals Association of North America and by the National Convention of Insurance Commissioners indicates that co-operation in a work of the highest utility is henceforth to be the order of the day, instead of mutual antagonism between bodies whose real interest is the same. This outcome is one from which everybody concerned, and particularly in the long run the public at large, must greatly gain.

The Washington correspondent of this paper reports that an error of considerable importance was made in engrossing the new Internal Revenue Act, and that the Act as signed by the President did not conform, in a provision regarding insurance, with the text of the Act as actually adopted by Congress. The error noted is in connection with the paragraph of the Act dealing with fidelity, employers' liability, plate glass and other related kinds of insurance (other than life, personal accident and health, etc.) and with the writing of guaranty and surety bonds [pages 19-20 of the law as separately printed, with designation Public—No. 217—63d Congress]. At the end of this paragraph in the law, as published, is the following proviso: "Provided, That policies of reinsurance shall be exempt from the tax herein imposed by this paragraph." But as the Bill followed its legislative course in Congress, this proviso was inserted (with other matter) by the Senate, as Amendment 84 to the Bill as it came from the House. When the Bill, as amended by the Senate, was referred to the Conference Committee of the House and Senate the whole of Amendment 84 (including this proviso) was stricken out of the Bill through the Senate Conferees receding from the amendment on behalf of the Senate. This appears from the Conference Report on the Bill to the House (Page 17), where it is stated: "Amendment No. 84. This amendment refunds the tax paid upon policies which were canceled or upon premiums which were returned and the Senate recedes." In this wise the Conference Report shows the matter, as it is printed in the Congressional Record of October 21, page 18620. In other words, the records of the legislative proceedings shows clearly that the whole of Senate Amendment No. 84, including the proviso in question, was stricken out by the Conference Committee of the two Houses, and that the Bill when reported back to the Senate and the House by the Conference Committee did not contain this proviso. Perhaps it was intended that it should be there, but it certainly was not there. And the Bill was enacted into law by both the Senate and the House without the proviso. When, however, the Act was engrossed, to be sent to the President for his signature, the proviso was somehow inserted, though without warrant. This is not the place or time for discussing the legal bearing of this unfortunate mistake; but it is certain that insurance companies writing ordinary fidelity, personal accident and health, plate glass, boiler and other subsidiary forms of insurance, as well as the surety companies, should have the matter well looked into.

THE MOVEMENT FOR THE UNIFORM TABULATION OF INDUSTRIAL ACCIDENT EXPERIENCE

THERE are grounds for congratulation that the American liability insurance companies, through the medium of the Workmen's Compensation Service Bureau, have made an accomplished fact the scheme, first suggested some two years and a half ago, for the uniform tabulation of statistics in regard to industrial accidents coming within the scope of the various State workmen's compensation laws. No move that could have been made could be more auspicious for the placing of the business and theory of workmen's compensation insurance on a sound foundation. Not only from the point of view of the underwriter is this consummation of paramount importance, but also from the point of view of directing the course of future compensation legislation in this country along fundamentally sound and workable lines.

The subject of the tabulation of workmen's compensation statistics was first considered in the Spring of 1912, when a plan was formulated for reports to the Workmen's Compensation Service Bureau on blanks very similar to those on which the companies at one time reported their employers' liability experience. This plan, however, met with strong opposition from those who perhaps appreciated more fully what was involved in the change from the old to the new system of employers' liability for injuries to their workmen arising in the course of the employment. To them it was patent that the opportunity had come to get away from the uncertainties of the old régime under the employers' liability laws and to put the writing of workmen's compensation insurance on a basis almost, if not quite, as solid and calculable as that upon which the immense structure of life insurance rests.

This side of the question was brought out clearly in a brief prepared by Mr. C. E. Scattergood, assistant secretary of the Fidelity and Casualty Company, who, as chairman of the Statistical Committee of the Workmen's Compensation Service Bureau, has since been one of those most influential in the formulation and promulgation of the present plan. This brief was brought out early in 1913, but is extremely pertinent in tracing the development of the now accomplished results. We quote, in part:

"Is it not time now to make a change, if possible, in the matter of basic tables for rates, seeing that we have just entered into the new field of workmen's compensation? Can we come into possession of basic tables of experience similar to the mortality and sickness experience tables? We can if we adopt the system of reporting accidents to the Bureau according to the card system proposed by the Committee on Statistics. We cannot do it if we adopt the blank for reporting experience which the Committee on Statistics drew up at the direction of the Bureau, for this blank is simply a paraphrase of the old blank upon which the companies at one time reported their liability experience. From this blank you can tell what you paid out, but not why you paid the money out, except in a very general way—too general to be of even small value. The card system tells not only what you paid out, but also why you paid it out. The cards show the two most important phases of workmen's compensation: the blanks but one. * * *

"The adoption of the blank would result in a very inflexible system; the use of cards gives rise to a condition of great flexibility. The blank relates the money amounts to classifications and wages as the basis of exposure. If at any time any other exposure is desired, the companies will be obliged to do all of their tabulating over again and the Bureau all of its combining over again. In the card system the same cards would be run through the sorting machine and sorted out according to the new basis of exposure, and then added on the tabulators an operation similar to that of one of these small electric fountains which use the same water over and over again. You cannot get this condition from the fixed form blank. In case a company desires to keep its own experience for itself, two cards can be punched by the punching machines at the same time. One may be sent to the Bureau and the other retained for use by the company.

"Another objection to the fixed form blank is that the effect of an amendment to a compensation law is attainable only with great difficulty. The blanks are designed for a year as the time basis. If an amendment takes effect at any other time than the first of a year, you can appreciate the difficulty of finding the effect of that amendment. The cards are all dated according to the dates of the accident, and can readily be sorted into periods corresponding to those of old law coverage and new law coverage. * * *

"Lack of uniformity in having various companies do the same work under the fixed form blank is objectionable. In 1908 when the companies reported liability statistics to the Liability Bureau, although the plan of reporting was much simpler than any plan of reporting under workmen's compensation could be, there was considerable lack of uniformity in the way the reports were rendered. No matter how carefully the Statistical Committee or the Bureau may draft blanks for the reporting of experience or in furnishing directions for such reporting, there will be variations in the manner of doing this work. Not only will the supervisors of statistical work in the various companies have naturally differing ideas with regard to the interpretation of the directions and the blanks, but the clerical force who do the work will certainly cause variation in the manner of sending this information to the Bureau. * * *

"If we do not obtain information as to causes of accident, periods of disability, occupations, age, sex, etc., we shall not be up to the standard in this respect of our own and foreign government tabulations, as well as those of individual corporations; and if we look askance at these tabulations of others, how shall we regard our own? The cards will give all the information and the fixed forms of blanks will not.

"The use of the fixed forms of blank gives an experience which is a combination, or mixture, of amounts paid out for various periods of disability. In one State the period of disability for the same kind of accident may be different from the disability period for the same kind of accident in another States, and the percentage of wage to be paid as indemnity may also differ. The card system will show all of these disability periods and the percentages of wages returned as indemnity may also be used. The card system will furnish us with a method of calculating rates under a proposed new or amended law from the accident and disability experience of other States, and this work can be done in a scientific manner.

"It is hoped and believed that the compilation of statistical experience tables, which the Bureau can accomplish by using the card system, will result in placing the companies writing compensation insurance upon a foundation approximating that of life insurance companies, which through strict scientific calculation upon two simple tables of mortality and interest has made the methods of life insurance companies recognized as unquestionably correct."

The point of view thus expressed has been recognized as the most logical and most far-sighted one. The committee of statisticians from various liability companies in the Workmen's Compensation Service Bureau devoted over a year and a half to formulating a plan which would be comprehensive and at the same time workable. The result was a tentative system which was submitted to the liability companies on June 8, 1914, and which has since been

adopted *in toto* with but one or two minor changes. The system may be reviewed briefly by quoting a few paragraphs from the memorandum submitted by the Bureau to the companies. They are as follows:

"We call to your attention that it is proposed to use the Hollerith punched card system wherein the analysis and tabulation will be done by machinery. The holes punched in the cards will cause electric contracts to be made according to the position in the cards of the punched holes. These contacts operate the sorting and adding devices of the machines through which the cards are run.

"We are therefore limited to a card containing forty-five columns of digits, samples of which are sent you herewith. In studying the proposed system, please remember the limiting conditions of the cards. We have tried to get out of the cards all we possibly can.

"The system is divided into three parts: (a) Experience on accidents up to the time of their compilation; (b) the outstanding experience on accidents not completed at the time of compilation; (c) the exposure.

"As far as exposure to payroll or premiums is concerned it is proposed to keep the experience according to the calendar years in which the policies were issued, to be reported as of a date four months after the end of the next succeeding calendar year. As an illustration the experience on policies issued during 1913 would be reported as of April 30, 1915. Under this plan every policy would have completed its policy term, and almost all of the payrolls would have been audited, and every accident would have been reported. On accidents happening in January, 1913, we would have the experience for twenty-seven and a half months succeeding the accident and on acicdents occurring during December, 1914, we should have four and a half months erperience. Every succeeding year after the experience was first reported the records would be revised as to developments on accidents occurring after the experience had been compiled, but this would concern not over 3 per cent of the total number of accidents reported as it would be concerned with long term disabilities and fatal cases of which though the payments on them are heavy the number is few. * * *

"In punching these cards the digits punched will represent information that would otherwise be that of a written description. A number of codes have therefore been constructed from which to punch the cards. * * *

"Each company would have to use the same codes, and these would be:

A code for State.
A code for Classification.
A code for Per Cent of Impairment.
A code for Age Group.
A code for Developments.
A code for Cause of Injury.
A code for Nature of Injury.
A code for Kind of Specific Benefit.

"The Bureau will supply these codes to the companies. * * * It becomes necessary therefore to have a definition for an accident which all of the companies will follow. An accident will be an injury which occasions the workman to be away for at least a full day following the day of the injury. In all cases, however, where medical payments are made, whether counted as accidents or not, the amount of the medical payments will be punched in the field headed 'Medical.'

"In all 'payment' or portions of the cards relating to money, dollars only will be punched, and fifty cents or more will be considered as an extra dollar."

It may be added that industrial diseases, where such are compensatable under certain State compensation laws, are likewise to be reported and the experience tabulated.

Significant as is this work, as indicating the desire on the part of the liability insurance companies to establish their business on a basis of fact and to protect insurer and insured alike from the inevitable losses of a hit-or-miss system of underwriting, it is even more significant that the work should be taken up not alone by the insurance companies themselves, but by the United States Government and by several large employers of labor. On October 12, a conference was held in Chicago in response to a call sent out to the members of the National Conference on Standardization of Accident Reports and Tabulations and of the Committee on Standard Forms for Accident Reporting of the National Council for Industrial Safety, by Mr. Royal Meeker, Commissioner of Labor Statistics of the United States Department of Labor, who is chairman of those two organizations. The Committee on Standard Schedules and Tabulations of the American Association for Labor Legislation and representatives of the Workmen's Compensation Service Bureau, insurance companies and employers were also invited to be present. Thus the meeting took on a character truly National in scope, including representatives of practically every group in the country interested in the field of the discussion. Three previous meetings had been held (at New York City on February 28 and April 10, and at Harrisburg, Pa., on September 2), but these were to some degree formulative and less comprehensive than the Washington conference. Below are the resolutions adopted by the Washington conference as reported in the minutes of the meeting. It is interesting and significant that there is an evident agreement, between these resolutions and the plan of the Workmen's Compensation Service Bureau, as to the bases on which accident reports are to be made.

"1. Definition of reportable accidents. (a) All accidents causing death, permanent disability, or loss of time other than the balance of the day, turn, or shift on which the accident occurred shall be classified as reportable accidents, and a report of all such accidents to some State or National authority shall be required. (b) Where a compensation act provides for any expense on account of medical attendance or hospital treatment, thus necessarily involving a report of such cases, even though resulting in no loss of time or in a loss less than that specified above, such minor accidents should be classified separately in all tabulations and compiled reports. (c) The employer shall be required to enter upon his record all reportable accidents as above defined, and also all accidents causing a loss of time less than that above specified or requiring any medical attention.

"2. Classification of accidents according to their consequences. (a) Accidents should be classified according to their consequences as resulting in death, total permanent disability, partial permanent disability, and temporary disability. (b) Accidents resulting in temporary disability should be classified according to length of temporary disability so as to show the number terminating in the second and third days, number terminating in the fourth to seventh days, inclusive, number terminating in the second week, in the third week, in the fourth week, in the fifth to thirteenth weeks, inclusive, in the fourteenth week and later. (Clear definitions of the classes are yet to be adopted.)

"3. Time of reporting accidents. (a) In the case of accidents terminating fatally within seven days of the accident occurrence, notice shall be given within twenty-four hours of death. All reportable accidents shall be reported, upon standard accident blanks,

in full, within seven days of the occurrence of the accident. (b) A committee shall be appointed to formulate a resolution covering the subject of the final report.

"4. Accident report forms. The form adopted to be recommended for first reports of accidents has already been given in full. (Pages 13 and 14, Minutes of Conference.)

"6. Computation of rate of accidents. Accident rates should be age number of men should be the actual number of man hours for the year; that is, the total working time for all employes of the establishment or the department for the year reduced to the number of hours required for one man to do the same work. This should be taken from exact records if such records are in existence. (b) If this exact information is not available in this form in the records, then an approximation should be computed by taking the number of men at work (or enrolled) on a certain day of each month in the year, and the average of these numbers multiplied by the number of hours worked by the establishment for the year would be the number of man hours measuring the exposure to risk for the year.

"6. Computation of rate of accidents. Accident rates should be expressed in terms of number of accidents per 1,000 full time workers; that is, workers employed 300 days of ten hours each. (This is in accordance with the practice of Germany, Austria, and a number of other European countries and also in accordance with the recommendations of a joint committee of the Permanent International Committee on Social Insurance and the International Institute of Statistics.)

"7. Classification of causes of accidents. The chair shall appoint a committee on the classification of causes of accidents, the committee to meet not later than early in December and to submit its report to a latter meeting of the conference.

"8. Classification of nature and extent of injury. The chair shall appoint a committee on the classification of the nature and extent of injury, the committee to meet not later than early in December and to submit its report to a later meeting of the conference."

Thus it at once becomes evident that uniform accident reports, on a country-wide scale, are soon to be in full force. Thus a starting point is at last established from which to begin an effective campaign against our annual National economic loss in time, energy, and money, due to wholly preventable and unnecessary accidents,—a field of endeavor so long characterized by loose talk and sporadic effort. Thus, too, a way is made clear for the placing of the great whole of social insurance, beginning with workmen's compensation proper, which we now have, and including such other forms as sickness insurance and unemployment insurance, which all signs point to our adopting sooner or later, upon a scientific instead of a sentimental basis.

COMPARATIVE MORTALITY OF THE PRINCIPAL CITIES OF THE WORLD

By Shirley W. Wynne, M. D.*
Assistant Registrar of Records, New York City.

IN studying the course of the death rate of any community during a period of years in order to estimate the effect of improved sanitary conditions, it is permissible to employ the crude death rate on the assumption that the sex and age distribution has remained nearly the same, and that this is true also of climate, seasonal changes and other conditions beyond the control of the health authorities. It is an entirely different matter, however, when one attempts to compare the salubrity of one community with that of another; here the employment of the crude death rate leads to serious error because of the number of factors by which it is influenced. It is evident, for example, that if the females, among whom the death rate is relatively low, largely outnumber the males, the death rate will be lowered; likewise, if the number of persons at the beginning and end of life, when mortality is at its maximum, is disproportionately large or small, that alone will markedly influence the death rate irrespective of the healthfulness or unhealthfulness of the community. These two factors, namely, sex and age constitution of the population are largely responsible for the extremely low death rates "enjoyed" by some of the newer communities. As an illustration of this we may consider the low death rate of the Panama Canal Zone, which is due to the fact that the population is made up of selected adults between the ages of twenty and forty-five. A continuously high birth rate usually makes for a low death rate. At first sight this appears to contradict what has already been said, but a little consideration will show that this indicates a large proportion of persons in young and middle adult life, when procreation is vigorous. A high birth rate for several years followed by a low birth rate makes for a still lower death rate, followed, however, by a very high rate; a continuously low birth rate makes for a high death rate.

The presence of numerous factories in a community tends to lower the death rate by causing an influx of young adults, whose mortality rates are low; the closing of these factories because of labor troubles, business depression or other similar conditions usually causes an emigration of these adults, and leads to an increase in the death rate in proportion to the decrease of this most healthy element of the population.

The nature of the industries of a city or town, whether healthful or unhealthful, dangerous or safe, the climate, the seasonal changes, the density of population are all reflected in the crude death rate and raise or lower it independent of the sanitary conditions.

It becomes desirable, therefore, to secure some means of comparing with a fair degree of accuracy the healthfulness of one community with that of another; to adopt some method that can be fairly applied to communities in different parts of the world, regardless of the sex, age, occupation or other social conditions of the inhabitants. The ideal method of making such comparisons is by means of a life table, but it is only little available because of the immense amount of labor that it requires, and the consequent unwillingness or inability of most health officers to undertake the task. The next best test is the use of standard death rates, i. e., rates based on standard populations. This method too is seldom available, though it is to be hoped, now that the important governments of the world have adopted uniform methods of gathering and compiling statistics, that a universal standard of population for comparing birth, marriage and death rates will soon be generally adopted.

In the meantime, if we are to make just comparisons, we must seek for more available means by which to make our comparisons. The death rate under one year has been offered as a tolerably reliable criterion. Before accepting this as a guide let us examine some of the factors, aside from health conditions that cause a low death rate of children under one year. It is clear that when the rate is stated per 1,000 births the number of births will exert no influence on the rate from a mathematical standpoint. If, however, the infant death rate is calculated on the total population the birth rate will, if high, increase this death rate, and if low, lower the death rate. On the other hand, if the rate is based upon the reported births and the number of reported births does not approxi-

* An article published in the monthly bulletin of New York Department of Health.

mate the total number of actual births, a death rate based upon the reported births will be raised in proportion as the reported births fall short of the actual number. Industrial conditions causing women to seek employment during the periods of pregnancy and nursing, the number of foreigners in whom, perhaps, it is difficult to instill the principles of hygiene and infant care, are all conditions whose influence is reflected in the infant death rate. It is obvious, however, that the outside conditions that effect this rate are fewer and less important than those that affect the crude general rate, and that a comparison based upon this rate is, therefore, the more reliable index of the healthfulness of a city. At least in so far as that healthfulness is determined by the activities of the health authorities.

The combined rate from the so-called contagious diseases has also been advanced as a measure of health conditions but here too there are numerous factors tending to disturb the death rates of these diseases aside from the actual health conditions, for example, the failure on the part of physicians to report deaths as due to contagious diseases. Thus it is common to find death from measles reported under the complicating cause, pneumonia. Again, the proportion of children in the population markedly affects the death rate from contagious diseases, because these diseases claim the greatest number of their victims from the ranks of childhood. Moreover, other things being equal the density of the population would have a material influence upon the contagious disease rate. An epidemic of one or more of the contagious diseases would raise the death rate for the year in which the epidemic occurred, so the comparison should be based upon the study of these death rates for a number of years, particularly when a stated rate differs widely from the average.

As an index of sanitary conditions the death rate from typhoid fever probably affords one of the best guides as it is the least affected by the extraneous conditions, and the disease is possible of almost complete eradication.

The death rate from tuberculosis is also a fairly reliable index of sanitary conditions, provided, of course, that the returns are honest and the percentage of negroes in the population is known and allowed for. It is safe to say that a comparison based upon a careful examination of the crude death rate in conjunction with the birth rate, the infant death rate, the death rate from typhoid fever, tuberculosis and the contagious diseases will reflect the true conditions with a very fair degree of accuracy; such an examination will, at least, aid us in detecting disturbing elements that tend to vitiate the figures under examination.

Bearing in mind all that has been said, let us now institute a few comparisons of the death rates of certain large cities of the world. We shall consider first American cities.

American Cities.

Seattle.—Examining the rates of Seattle in the different columns of the table one is immediately struck by the low rates throughout; the crude rate of 8.37, especially attracts attention; the continuance of such a rate would mean that every person in the City of Seattle would live to be 119 years 6 months, a most absurd proposition. Naturally one thinks immediately of the composition of the population as the probable cause of this low rate. Reference to the census populations for Seattle confirms our suspicion, for it is found that more than 54 per cent of the population is between the ages of twenty and forty-five as compared with 42 per cent for the City of New York. This large percentage of persons between twenty and forty-five years not only reduces the crude rate but to even a greater degree lowers the death rates of the contagious diseases. The rate from pulmonary tuberculosis is suspiciously low, and one questions whether it is due solely to the healthfulness of the community, or whether it is not due in part at least to other causes, such as the death of residents of Seattle in sanatoria outside the city limits, or the return home to die of immigrants employed in Seattle. It cannot in any great measure be due to incorrect returns of the causes of deaths, for were such the case the crude general rate would be higher than 8.37.

Likewise, the low death rate among infants under one year, based, as it is claimed, upon the number of births is strongly suggestive of statistical error, particularly in view of the birth rate of 15.15, the lowest reported for any of the cities given in the table. It may be said, with all fairness, that a study of the rates for Seattle throws absolutely no light on the salubrity of the city; it serves only to rouse our skepticism so that we refuse to accept the figures as a basis of comparison with other cities until they are fortified with data necessary for a more complete analysis.

Chicago.—The City of Chicago shows the highest combined contagious disease death rate in the list, but its tuberculosis rate is moderate and its general death rate compares favorably with those of the other cities so that either the salubrity of Chicago is on a par with that of the other cities, or the sex and age distribution of the population affects favorably its death rate.

Detroit, Cleveland.—Two cities, Detroit and Cleveland, show a high combined contagious disease death rate, but low rate from tuberculosis, which gives rise to the conviction that their tuberculosis returns from some reason or other are not complete, and that the low general rate of Cleveland, at least, is not to be attributed to its great healthfulness, and this conviction becomes stronger in view of its high infant mortality.

Los Angeles.—Los Angeles enjoys the lowest combined death rate from contagious diseases due, no doubt, to its ideal climate. This permits its inhabitants to enjoy outdoor life to the fullest extent, but indirectly, and unfairly increases the tuberculosis death rate of the city by attracting a large number of sufferers from this disease.

New Orleans.—The combined contagious disease death rate of New Orleans is about the average for the other cities. The death rate from tuberculosis, however, is extremely high and is attributable to the large percentage of negroes in its population.

Cincinnati.—Cincinnati, while its combined contagious disease rate compares favorably with those of the other cities, shows a high death rate from tuberculosis, in fact, a rate second only to that of New Orleans. The cause of this is evidently to be found in its climate, the nature of its industries and in the other social conditions of its inhabitants.

New York.—The rates for the City of New York compare favorably with those of the other cities, particularly when the crowded conditions under which a very large part of its population lives are taken into consideration. In certain parts of New York the number of persons to the acre is higher than in any other city in the world. Despite this New York's contagious disease rate is not abnormally high; in fact it is lower than that of many of the small cities wherein the living conditions of the inhabitants are more favorable. Likewise, the death rate from tuberculosis, while higher than in several other American cities, is lower than the majority of those whose rates appear in the table.

The death rate of infants under one year, based on the number of reported births which, by the way, to-day are about 99 per cent of the actual births, is surpassed only by seven other cities and the correctness of the figures of one of these, at least, is very doubtful.

It is noticeable that in those cities in which the climatic conditions favor outdoor life throughout the year, the death rates from the contagious diseases are below the average, while in those

cities in which the Winters are severe and protracted, thus curtailing outdoor life, the corresponding rates rise above the average; the same is true of the tuberculosis rates unless the number of negroes in the population or the number of tuberculosis persons attracted to the city because of its climate are sufficient to raise what otherwise would be a low rate.

The possibilities of the contagious rates of any city being raised because of the prevalence of an epidemic of one or another of these diseases must not be lost sight of, though it is safe to assume that if all are uniformly high, that those rates reflect the usual or average health conditions of the city in question.

European Cities.

Comparing the crude death rate of New York with that of the principal foreign cities we find it is lower than twenty-two of those mentioned in the table, being almost 50 per cent lower than seven. It is noticeable that those cities in which the general death rate is high, the death rates of the communicable diseases, particularly typhoid fever, is proportionately high.

Charlottenburg.—The death rate of Charlottenburg (a suburb of Berlin) is the lowest in the list, 10.74, followed closely by Stockholm, 10.98; Amsterdam, 11.11; Zürich, 11.14, and Düsseldorf, 11.36. All these are cities of about one-half million population or less. These rates are so extremely low as to cause one to question whether they are due entirely to the healthfulness of these cities or whether some other cause is not responsible, at least in part.

The combined contagious disease rate for Charlottenburg is moderately low; its death rates from typhoid fever decidedly so. The death rate from pulmonary tuberculosis of 87.9 is the lowest in the list and causes one to wonder whether many of the sufferers from this disease do not seek treatment in the sanatoria outside of the city, to which district their deaths, when they occur, are charged instead of to the city proper.

The death rate of infants under one year, namely 122.7, is rather high when compared with the rate in many of the other cities, particularly the larger cities such as London, Paris and New York.

Zürich, Düsseldorf.—There is nothing in the figures of Zürich or Düsseldorf to warrant any suspicion that their low rates may be due to other than their salubrity.

Amsterdam.—The death rate of 11.11 credited to Amsterdam is immediately questioned when it is noted that the combined contagious disease rate, as well as the death rate from typhoid fever and tuberculosis is about the average reported for the other cities, while its death rate of infants under one year is absurdly low, 66.8. The explanation of this seeming paradox is that the deaths of infants dying shortly after birth are not included in the deaths. Were these deaths included, as they should be, the death rate of Amsterdam would certainly not be lower than the average.

Stockholm.—The combined death rate from contagious diseases in Stockholm, namely 14.1, and the rate for typhoid fever, namely 0.9, are the lowest of any in the table. The death rate from tuberculosis, however, is comparatively high and the infant death rate is absurdly low, 66.5. The latter gives one a clue as to the reason for the low general rate, which as in the case of Amsterdam is most probably to be found in the exclusion from the general death rate of the deaths of infants dying immediately after birth.

Barcelona.—The highest death rate recorded in the table is 24.43 for Barcelona. The death rate from combined contagious diseases, typhoid fever, pulmonary tuberculosis and pneumonia are likewise the highest reported for any city, thus indicating marked unhealthfulness.

Berlin, London, Paris.—Of the cities having a population of over 2,000,000 Berlin shows the lowest general rate, 13.48, New York follows closely with 13.76; London, 14.39. The death rate of Paris, 15.40, is the highest.

The death rate for pulmonary tuberculosis is remarkably high in Paris, 3.178, as compared with 1.601 in New York; 1.324 in London, and 1.548 in Berlin.

The death rate from typhoid fever is lowest in Berlin, 1.6, and highest in Paris, 9.7, per 100,000.

The heaviest death rate of infants under one year is recorded against Berlin, 139.3, as against 102.4 in New York; 99.3 in Paris and 105.4 in London.

The birth rate of Paris closely approached its death rate being less than a point and one-half higher. Vienna shows the next lowest birth rate, 17.68, approximately two points and one-half above the death rate. The birth rate of New York is the highest, 25.15, as against 24.93 for London. On the whole the statistics for the

The estimated population of New York as calculated by the Department of Health is much higher than that of the Bureau of the Census at Washington, D. C., and in consequence the specific death rates given above are much lower.

City of New York compare more than favorably with those of the other large cities, particularly when it is considered that it has the second largest population in the world and easily stands first in the dense crowding of its inhabitants.

In summing up it may be said that the combined contagious disease rate, particularly when examined in conjunction with the death rate from typhoid fever, pulmonary tuberculosis and the infant death rate, is a safer index of the healthfulness of a city or community than the crude general rate, for while it may be impossible to determine therefrom the true conditions that are responsible for an extremely low or high crude rate, it, at least, gives a tangible clue to the presence of extraneous conditions which are exerting an unfair influence in lowering or raising the crude death rate.

NATIONAL BOARD OF FIRE UNDERWRITERS AND THE TABULATION OF FIRE STATISTICS

ACTION of the deepest importance was taken by the National Board of Fire Underwriters at a special meeting held in New York City on October 29. The principal business to be considered was the transmissal by the Executive Committee of the report of the Actuarial Committee and the presentation of resolutions in connection therewith, which resolutions were adopted by the Executive Committee on September 24, and are here given, as follows:

"First.—That the classification of occupancy hazards and the form of loss report blank, as prepared by the Actuarial Committee, be adopted and made the standards of the National Board of Fire Underwriters to take effect January 1, 1915;

"Second.—That each company member of the Board and/or subscribing to the work of the Actuarial Bureau be requested to begin to use same from said date, in order that uniformity of classification and loss reports may obtain, thus making practicable a combined experience of essential value for statistical purposes.

"Third.—That there be established within the Board a new department to be known as the Actuarial Bureau, the work of which shall be to gather from the members of the Board, as well as from such non-member companies as may desire to join in the work and support of the bureau, their experience of writings and losses in the United States, which experience shall be classified according to the standards hereby adopted. This experience to be combined and tabulated for the purpose of obtaining the fire loss costs of each and every class of hazard in the United States.

"Fourth.—That a part of the work of the Bureau shall be:

"(a) To compile a record of all fire losses upon property in the United States as reported by its members to the Bureau upon the standard blanks hereby adopted, with information regarding location, character of property, values, insurance, origin of fire, etc., etc.

"(b) To investigate the fire dangers to which each class of property is subject and to develop thorough and scientific information concerning the causes of fire and their prevention.

"(c) To make and maintain an alphabetical index of all loss claimants as reported by the companies, with the fire record of each, such information to be for the benefit of the subscribers to the Bureau.

(d) To furnish annually to each State or other lawful authorities that shall require reports of losses, a complete record of losses therein for each fiscal year and in addition thereto, immediate advices to the proper authority in such States concerning losses that

require the investigation of the fire marshal. Such annual reports taking the place of all specific loss reports now or hereafter legally required.

"Fifth.—That the entire affairs of the Bureau shall be under the charge of a standing committee to be known as the Actuarial Bureau Committee, the acts of such committee being subject—as with other standing committees of the Board—to the supervision of the Executive Committee.

"Sixth.—That the expenses of the Bureau shall be met by an assessment upon the companies subscribing to its support and as a temporary measure be based upon the gross premiums—it being meant by "gross premiums" the premiums as shown in the policies, less only cancellations; and the assessment to cover expenses until the next annual meeting in May, 1915, shall be at the rate of 1 50 of 1 per cent payable upon demand, the permanent basis of future assessments to be determined by the Actuarial Bureau Committee subject to the supervision of the Executive Committee.

"Seventh.—That upon due application to the Actuarial Bureau Committee any company not now a member of the Board, and whether eligible for full membership or not, may become a subscriber to the Actuarial Bureau without participating in the other functions of the Board, provided such company contributes to the expenses of the Bureau the same percentage of assessment or assessments from the commencement of the Bureau work as have been levied upon the subscribers."

These resolutions had already received unanimous endorsement from the Fire Marshal's Association of North America and from the National Convention of Insurance Commissioners, and the adoption of them by the National Board assures the going into effect of a plan of nation-wide importance from the point of view of sound underwriting and of the reduction of our National fire waste. It is without doubt the most vital work that the National Board has ever undertaken.

Not the least interesting part of the resolutions is the evident intent to co-operate actively with the State insurance departments and fire marshal's offices in the use of the data obtained. It is understood that the insurance commissioners of many States have agreed to do their part by insisting on reports similar to those of the National Board from all companies, stock and mutual, who are not reporting through the Board. Thus, the experience of practically every company in the country, with the possible exception of a few farmers' mutuals, will be at the disposal of the authorities and of the companies. This means, surely, the establishment of the business of fire insurance on a basis almost actuarial in character, if such a basis is possible of ascertainment, and assuming, of course, that there is a calculable law of average for fire losses. This, too would seem to establish a base from which to direct a concentrated attack against the annual property loss through fire, in the same manner that the liability companies are directing their efforts for the reduction of the waste through accidental injuries to the great mass of our working population.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

London Lloyds Underwriters Deny Ruinous Losses on War Risks. Not unnaturally, the steady stream of reports of British, French and Russian ships captured and destroyed by the flying German cruisers on all the oceans has given rise to some discussion, on this side of the Atlantic, as to the results to the Underwriters of Lloyds, London, of the numerous war risks they have been supposed to have on their books. Rumor has it that the losses have been of the severest character and that the position of a considerable number of the Underwriters at Lloyds has been dangerously weakened. In some instances, these allegations have bene decidedly concrete in form, with all the appearance of having actual knowledge of the facts behind them. American publications concerned with commercial and insurance matters have been led to give some attention to the subject and, in the light of the information they had, have published statements mainly confirmatory of the rumors. Upon receiving these published reports, however, important London representatives of the Lloyds business have sent indignant denials of the truth of them. A large New York insurance brokerage firm has just received from one of the most prominent London houses in the business a letter strongly setting forth the Lloyds side of the question. The essential portions of this letter are as follows:

"We are in receipt of your leter enclosing cutting from the 'Journal of Commerce' with regard to Lloyds. These paragraphs, as you of course know, appear from time to time in the papers; and although the responsible editor cannot, we think, know that the information is given for a purpose, yet it must be so. In this case, as in almost all of the instances, the information supplied is hopelessly incorrect.

"The Authorities at Lloyds have always declined to enter into any correspondence or to make any attempt to refute the ridiculous statements which appear from time to time. Rightly or wrongly, the impression on this side is that the security of a Lloyds policy is held in very high estimation by those on your side whose opinion is worth having; and, if there are any who hold a different opinion, there is an easy way out of the difficulty and that is to place in other markets any business they may have. We can assure you, the Underwriters at Lloyds will not complain.

"As regards the particular article you send, it is untrue.

"Lloyds Underwriters have *not* lost heavily on war risks; but, on the contrary, they have done very well. As an instance of how absurd the statements are, we may say that in the case of the 'Emden's' capture of six steamers, only in *one* case (the 'Diplomat') was the cargo insured at Lloyds and, as you know, the hulls are insured in Clubs and not at Lloyds. The amount insured at Lloyds on the 'Diplomat' was not $1,000,000, and nowhere near that amount. There are many Insurance Offices who would like to have the 'book' which Underwriters at Lloyds have at this moment on war risks; and there is little doubt that a large profit will be made. In addition, the years 1912 and 1913 have been very profitable to Lloyds Underwriters on business generally; and 1914, to date, promises even better.

"As regards the statement made in the article *re* the 'Indian Prince,' it is probably unnecessary to say more than that the Underwriters have not yet been asked to pay the loss."

* * *

Life Insurance in Switzerland.—Twenty-six companies were writing life insurance in Switzerland in 1912. Of these 6 were Swiss, 9 German, 6 French, 1 Austrian, 2 British and 2 American (the New York Life and the Germania). New policies written by Swiss companies numbered 33,212 for a total of 82,990,226 francs [franc equals 19.3 cents]. Foreign companies wrote, on residents of Switzerland, 8,891 policies, totaling 66,732,966 francs. These figures are exclusive of risks reinsured. In the figures, however, are included industrial policies. These made up a total of 20,787 policies for 13,636,253 francs for the Swiss companies and 94 policies for 101,060 francs for the foreign companies.

Twenty-nine foreign insurance companies had life insurance in force in Switzerland on December 31, 1912, totaling 89,308 policies for 681,121,749 francs. Nine of these companies were German, 11 French, 1 Austrian, 5 British, and 3 American (New York Life, Germania, and Equitable). The total assurances in force at the

close of the year on lives at home and abroad of the six Swiss companies amounted to 230,864 policies for 763,501,573 francs.

Nine hundred and seventy-three foreign industrial life policies for 905,538 francs and 92,500 Swiss industrial life policies for 68,-241,017 francs are included in the above figures.

The life insurance premiums and annuity considerations received in 1912 at home and abroad by Swiss companies were 41,156,154 francs and 9,417,641 francs, respectively; those received by foreign companies on Swiss business were 26,572,087 francs and 414,274 francs, respectively. The number of annuity contracts in force of foreign companies was, at the end of 1912, 731 for 620,010 francs, while annuities in force of Swiss companies at home and abroad were 9,262 in number and amounted to 7,679,501 francs.

The following tables gives the business done by American life insurance companies in Switzerland in 1912:

	Equitable.	New York Life.	Germania.
Insurance in force, 1912:			
No. of policies	214	2,202	1,295
Amount (francs)	2,160,107	29,592,031	9,645,356
Annuities in force, 1912:

Amount (francs)	4,088	82,523	359
New insurance issued, 1912:			
No. of policies	*	213	2,883,124
Amount (francs)	*	162	1,179,820
Premiums received, 1912:			
Ordinary life (francs)	37,088	1,549,064	406,928
Annuities (francs)	.....	25,094	.....

*Has ceased writing new business.

INSURANCE NEWS IN THE WEST

Unsettled Outlook for Fire Insurance in Illinois.—That there is going to be trouble in Illinois this Winter is pretty evident from the attitude of Superintendent Rufus M. Potts. It goes without saying that he and the fire insurance companies are at loggerheads. Otherwise they would not be suing each other. Mr. Potts has legislative plans which the companies will undoubtedly do their best to frustrate. He has been making a trip through the Southwest, among those States which have State rate regulation laws. He is reported as saying in Texas that if he cannot get through a compulsory State scheme that he has in mind he will get Governor Dunne to recommend to the Legislature the enactment of a law like that of Texas, which he has found the most drastic of any with which he has come in contact. This means a fight unless the Governor should conclude that it is inexpedient to make such a recommendation.

While Governor Dunne has had little to say as to his personal opinions on questions relating to insurance, it is a fair inference from his past record that he is favorably disposed towards a large measure of regulation, if not towards insurance by the State. When he was Mayor of Chicago he made a fight to get the street car system into the hands of the city and appointments made by him and policies adopted by him showed that he had decidedly radical tendencies. Furthermore, it is not reasonable to suppose that Superintendent Potts has taken the course he has without the approval of the head of the administration.

It is not likely, however, that the Governor will have smooth sailing for his policies with the next Legislature. Illinois legislatures, even when of the same political complexion as the administration, have been known often to show scant courtesy to a Governor in the last half of his term. The Governor is a Democrat. There is much likelihood that the Legislature to be elected next week will be divided among the three parties to such an extent that none of them will have a majority, and it is not probable that all the Democrats in that body will be radical enough to uphold such policies as Superintendent Potts plans to follow.

Moore, Case, Lyman and Hubbard and the Hartford Accident and Indemnity.—Probably no recent agency change has caused more comment in Chicago than the resignation of the general agency of the Standard Accident by Moore, Case, Lyman and Hubbard, in order to take a general agency of the Hartford Accident and Indemnity. The firm had represented the Standard Accident for many years and had $200,000 or $300,000 in premiums on its books. James H. Moore, senior member of the firm, has represented the Hartford Fire for over fifty years, and the relations of the office with that company are so close that as soon as the casualty company was put in the field it became a question whether Moore, Case, Lyman and Hubbard would take it on and let the Standard go. It appeared settled that they would not, but the unexpected happened. It is now understood that the Standard will open a branch office in Chicago. It is said not to look with any favor upon entering another fire office on the general agency plan, as some company in the agency might start a casualty annex and throw it out again. It is generally expected that Moore, Case, Lyman and Hubbard will transfer most of their business from its books, as they have a strong hold on their customers and their brokers. To avoid a repetition of this, the establishment of a branch office appears the only course.

This is perhaps the most important instance in the West of an agency giving up an old casualty connection in order to take the subsidiary of a fire company which it has had still longer, but the instances have been numerous enough and the volume of premiums involved large enough to make it evident that the agency departments of the casualty companies have a serious problem to meet, growing out of the organization of casualty companies as running mates of fire companies. In most agencies doing both fire and casualty business, fire insurance is the more important branch and often the favorite fire companies have much the stronger hold upon the agent.

* * *

Opposition to Interinsurers in the West.—B. V. Hubbard, of Chicago, has requested Insurance Superintendent Potts, of Illinois, to cancel the license of the Illinois Indemnity Exchange, of Springfield, a casualty interinsurance concern. It is not in the least likely that Mr. Potts will act upon the request, but, if he refuses to do so, an interesting situation may develop. Mr. Hubbard is the author of a book entitled "Casualty Interinsurance Exchanges," which is devoted to a strong attack upon these concerns generally, but especially upon those operating in Illinois. In his book he has produced very strong arguments to prove that the Illinois law under which these concerns operate in the State is unconstitutional. It is doubtful if anybody would atempt to refute his arguments. Fred W. Potter, the former Insurance Superintendent, under whose administration the law was passed, said that probably nobody thought it would hold water. He licensed interinsurers under it, on the ground that it was better to have the concerns under a semblance of control than running wild, as they would do without the law. Mr. Potts, before he became Superintendent was engaged in organizing the very exchange whose license Mr. Hubbard has asked him to revoke. He is known to be friendly to these institutions in general and there is no reason to think he cares less for this one than for the others.

Mr. Hubbard has made his request on behalf of that class named under the workmen's compensation law as "employes," many of whom are protected by insurance in these concerns, licensed under this alleged invalid law. The industrial board has no alternative but to accept the insurance in these exchanges as insurance under the law because they are licensed in the State. There is little doubt that somebody could become a party plaintiff in a suit

to compel the Superintendent to revoke these licenses, but whether Mr. Hubbard's interest is such that a court would recognize him in that capacity is not certain. Mr. Potts' refusal to accede to his request, however, might put things in such shape that somebody could start suit and actually get the courts to pass upon the law under which the exchanges are licensed.

* * *

Fight on State Insurance in Wisconsin.—On next Tuesday the people of Wisconsin will vote on ten constitutional amendments. Two of these, almost identical in phraseology, provide that the State may engage in the insurance business with all constitutional safeguards thrown off. If opponents of these amendments state the case correctly, the State officials and the Legislature have been guilty of an attempt to deceive the people which is disreputable to say the least. The Legislature passed on to the people two amendments, instead of one, apparently to fool opponents into the belief that when they had voted "No" on one of them they had done their best to defeat the State insurance plan, while there would be a chance that the other similar one would be adopted. The State has issued a pamphlet giving the text of the amendments in full, each being numbered. It is claimed that the law provides the order in which they shall appear on the ballot and that it is entirely different. Thus the voter who studies the pamphlet and determines to vote for or against amendments of certain numbers will, unless he is very careful, vote for those he intended to vote against and vice versa. The insurance men, including heads of some of the mutuals, have done good work to defeat the amendments, but the Socialist vote in Wisconsin is large, and there is grave danger that so many will fail to vote on the amendments at all that the Socialists and others who favor them will cast the required percentage of the total votes on amendments to adopt them.

Chicago, October 30, 1914. LA SALLE.

ITEMS OF INSURANCE NEWS.

The general inadequacy of surety claim reserves which has developed in the recent examinations of surety companies has induced the New York Insurance Department to endeavor to secure some more satisfactory method of computing such claims than is at present in vogue.. With this in view Superintendent Frank Hasbrouck has issued the following letter to all surety companies inviting them to offer suggestions for a basis which will provide a system of reserve on claims which will more nearly cover the requirements.

"Dear Sir.—This department has for some time had under consideration the question of adequate surety reserves. In our examinations of casualty companies doing surety business we have found in a number of instances that the reserves for outstanding losses were grossly inadequate. Within recent years several companies transacting surety business have been obliged to retire from buiness and the primary reason for the failure of these companies can be traced back to the fact that adequate reserves were not maintained from the beginning.

"Surety reserves are at present based upon estimates of individual cases, and it is practically impossible to accurately compute under this system a true reserve for losses long deferred and involved in litigation. This is a subject of great importance and one which should receive the careful attention and thought of the companies and the supervising departments. In order to obtain your views on this subject, kindly send in replies to the questions following by November 15, 1914:

"1. Do you think the present method of computing surety loss reserves satisfactory?

"2. Give reasons for answer to question No. 1.

"3. If you consider present methods unsatisfactory, what method would you advocate?

"4. Give reasons for advocating your method.

"5. Give details, showing how reserves would be computed by method advocated.

"6. General remarks on this subject."

Upon the recommendation of the Committee on Fire Prevention and Insurance, of which Mr. Alfred E. Marling is chairman, the Board of Directors of the Merchants' Association of New York, at the last meeting has taken action in opposition to two bills now pending in Congress which seek to regulate fire insurance by limiting the use of the mails.

The resolution embodying this action as reported by the Committee on Fire Prevention and Insurance, and unanimously adopted by the Directors, was as follows:

"The Committee on Fire Prevention and Insurance recommends that the Association oppose H. R. 17,139, Mr. Carter, and H. R. 17,363, Mr. Burns, which bills now pending in Congress deny the use of the United States mails for the purpose of effecting insurance or collecting premiums upon property situated in any State where, by the laws of such State, the companies issuing policies are prohibited from transacting insurance business in such State."

Following the presentation of arguments by representatives of the Association of Life Insurance Presidents, the State Tax Commission of Alabama has announced that it will not insist on taxing life insurance policyholders on their surrender values. This announcement supersedes the ruling of the Commission made on September 26 that such cash surrender values were taxable. The new decision was reached by the Commission on October 27 and the following announcement made to the local press:

"The State Tax Commission to-day unanimously decided, with the approval of the Attorney General, that it will not insist on the payment of taxes by policyholders on life insurance policies which have a cash surrender value. In view of the decisions of the Supreme Courts of Indiana and Minnesota and the opinions of the Attorney Generals of New York, Ohio and Pennsylvania, construing statutes similar to ours, which decisions and opinions hold that such policies are not taxable, the Commission made the above ruling."

William K. Bellis, secretary and general manager of the Reserve Loan Life of Indianapolis, died October 21 following a stroke of apoplexy. Mr. Bellis had for years been a prominent figure in insurance. He was born at Richmond, Ind., in 1853, and engaged in numerous business enterprises in his home State. In 1897 he, together with those associated with him in the management of an accident association, organized the Reserve Loan Life. He continued in the active management of that company until his death. The present Indiana insurance code was largely the work of Mr. Bellis who was active in bringing about changes in the law. He had something to do with the drafting and passage of every law now on the statute books of that State relating to life and accident insurance since 1884.

Of 3,377 fires which occurred in London, England, last year, says "Safety Engineering," 905 were caused by lights being thrown down, 276 by sparks from fires, 243 by children playing, 230 by gas lighting, 209 by various defective construction, 161 by candles, 144 by electricity, and 131 by overheated flues. Hot ashes caused 74 fires, gasoline and its vapors 76, burning rubbish 13, celluloid 12, tobacco 11, incendiarism 8, and in 35 cases there was doubt as to the reason. Carelessness caused 1,294 fires, heating 574, lighting 533. The causes were unknown in 304 cases and in 41 cases were deemed suspicious.

The following resolutions in regard to the United States Government war revenue tax were adopted by the National Board of Fire Underwriters at a meeting on October 29:

"Whereas, Owing to the fact that every policy issued must bear a revenue stamp, while no rebates will be allowed on account of cancellations or policies returned "Not Taken," the cost of revenue stamps to be affixed to fire insurance policies under the provisions of the Stamp Tax recently enacted by Congress will in all probability equal three-fourths of one per cent of the net premiums collected or about two and one-half millions of dollars, and

"Whereas, As shown by sworn reports the underwriting transactions of all fire insurance companies for the period of ten years from 1904 to 1913, inclusive, show a loss of sixty-two one hundredths of one per cent, amounting in the aggregate to $16,775,237, and

"Whereas, By means of State and local taxes, licenses and fees, and the general Corporation Income Tax, the fire insurance companies paid over eight and one-half millions of dollars in taxes in the year 1913, exclusive of assessments on real estate, this sum equalling 5.62 per cent of the aggregate net premiums received, less losses incurred:

"And Whereas, These facts being matters of public record were known to the framers of the emergency tax law, moreover the forms in which the tax law is drawn and the debate while the measure was pending clearly imply the intention and expectation that it should be borne by the insured.

"Therefore, Be it resolved, That, in view of the inexpediency, if not impossibility, of making and maintaining a general increase in fire insurance rates to meet the drain of taxation referred to, the National Board of Fire Underwriters strongly affirms the opinion that the cost of the stamps required should be borne by the policyholders, in addition to the premiums named in the policies;

"Resolved, That the National Board invites the attention of all its members to the subjoined statement,* as well as to the reports made from time to time by its presidents, touching matters of taxation, which lead to the inevitable conclusion that the assumption of the Stamp Tax by companies would be unwarranted and dangerous in view of existing conditions in fire insurance business;

"Resolved, That a copy of these resolutions and of the statement accompanying same be sent to every member of the National Board of Fire Underwriters."

[* It is impossible through lack of space to print this statement at this time.—Editor.]

FINANCIAL AND COMMERCIAL REVIEW

PROGRESS in readjusting financial and business positions has been substantial. As the third month of the war in Europe draws to an end the most convincing signs of financial improvement are exhibited by the foreign exchange market which means for us of course the market for sterling exchange. After the middle of October sterling bills began to decline and early in the present week they broke almost violently, recording a fall of three cents in the pound in one day. From the apex of recent recovery the decline aggregated about eight cents, and at the level reached and maintained in the last few days around 4.90, it can be said that the sterling exchange market is about at the maximum range normally reached under conditions of strain and difficulty.

A price of 4.89½ for demand sterling is quite sufficient in the ordinary state of things to draw gold out of the United States in great quantity and the movement would suffice to prevent any further rise in sterling bills. A curious feature of the present situation is that the customary gold export point is expected to mark a pronounced decrease of the foreign drain on our gold supply. This to be sure testifies to the extent to which the money market is still deranged, but evidence is accumulating that considering the conditions which the war has created, the international money position is getting into such satisfactory shape that gold movements will be more or less obviated. The profound weakness of German exchange, which became almost unsalable early in the past week at the price of 88½ for marks, continues to be a striking incident of the exchange market and is interpreted as reflecting both Germany's economic distress and her desperate effort to obtain supplies by purchase here for shipment through neutral countries in Europe despite the increasing aggressiveness of British endeavor to prevent contraband goods and commodities from getting into German hands. The progressive improvement of the business and banking situation has otherwise been denoted by the growing recovery of our foreign trade, especially of exports; by the manifest weakening of the domestic money market; by the larger investment dealings in securities and by the successful promotion of projects for re-establishing the cotton market.

So far as the foreign financial facts go there is plenty of encouragement for the view that the situation affecting us most has turned definitely for the better. The British moratorium is to end next week and all the signs are that it will have no very disturbing sequel despite the ominous predictions of our conservative critics who do not relish the unprecedented departure which British finance has made under the leadership of the Exchequer in dealing with the war crisis. If there were any serious apprehensions in the London banking community, sterling exchange would never have relaxed so much as it has nor would British bankers display increasing willingness to accept new American bills or extend old ones. The easiness of discounts in the London market has been a great influence in easing the international exchanges, and the position of the London discount market is supported by steady gains in strength by the Bank of England.

In the past week the Bank added $9,000,000 to its gold holdings which have risen $170,000,000 from the low level of August 7 and are by far the greatest stock of gold which the central institution of the world's central money market has ever had. The Bank's ratio of reserves to liabilities has been jumping about two points a week for several weeks, and is now almost 30 per cent, a figure which begins to be within reach of the ratios that have obtained in times of peace. It is more than double the proportion which was shown at the point of the Bank's greatest extremity in the first week of August. Incidentally it might be noted that loans at the Bank have contracted $125,000,000 from the maximum attained in early September.

Foreign trade returns help to encourage optimism about our own immediate economic future. The exigencies of war are chiefly responsible for the very heavy shipments of goods and commodities which we are making in swelling volume. A good deal of customary merchandise is hardly moving out at all, and although affairs are in train for much larger cotton exports than have been taking place there will be no normal cotton exports for a long time to come. Copper, which is rapidly consumed in war, is being exported in almost normal quantities again, but we have still a good way to go before our export trade even approximates normal dimensions.

It is satisfactory that in the first four weeks of October an export trade balance of about $25,000,000 was indicated, but this compares with an export excess of $68,000,000 in October last year. Furthermore, in the same four weeks of October the export aggregate was $51,000,000 less than last year, while imports were only $8,000,000 less. The necessities of other lands are stimulating a large liquidation of staples and merchandise which is sustaining our import trade, and although it is advantageous for us to get foreign goods cheap, the import movement is providing a considerable offset to the capacity of the export trade to liquidate our foreign indebtedness. As a matter of fact the supply of export bills in the foreign exchange market has only been one item in bringing about the relaxation of sterling remittance. Very substantial influences have been provided by evidence that we were going to do a large export business and by the willingness displayed to supply considerable sums of gold to meet our foreign obligations.

Domestic trade languishes in many important directions. Signal proof has been given by the action of the directors of the United States Steel Corporation in making a drastic reduction on the dividend on the common shares from the rate of 5 per cent to 2 per cent a year. Not until the market for capital is restored by the resumption of regular dealings in securities is it likely that domestic enterprise will move forward again except where it is directly stimulated by foreign buying to meet the necessities for which the war is responsible.

As for the reopening of the Stock Exchange, banking interests, while recognizing how desirable that is, hardly dare to con-

sider it in advance of the decision of the Interstate Commerce Commission in the reopened rate case. On this there depends the revival of investment confidence which is indispensable to furnishing more than the limited exchange of cash for securities that is going on under official supervision. The Interstate Commerce Commission has not, in the hearing of the reopened case, evinced a disposition to change its policy toward the common carriers, but it is a very fair conjecture from the general financial situation that the commission will find a sufficient excuse in the war emergency for making at least a temporary reversal of its regulative rulings and for showing that even a governmental commission can take cognizance of conditions at the expense of theories.

All the omens of the domestic money market are increasingly propitious. Lending rates have been holding about 6 per cent for commercial paper and for time accommodation on collateral security, but good judges of money are looking for something like a 5 per cent minimum before long. It is doubtful if anything cheaper than that will be witnessed. The early inauguration of the Federal reserve banking system promises additional facilities for meeting credit requirements, but unless the administration of the new banking system is unbelievably foolish reserve bank discount rates will be fixed high enough to prevent any rapid inflation of borrowings.

New York	49⅛	50¾	50¼	50⅜	48½	48½
London	22½	22½	22½	22½	22⅜	22⅜

COTTON

October 31, 1914.

ONE fact may be said to have been established during the past week in the opinion of the cotton trade, and that is that the present season's production of cotton in the United States has very nearly equalled, if it has not surpassed the highest of all previous records. The report of the Bureau of the Census, issued on Monday, showed the largest amount of cotton ginned up to October 18 of which there is record, except for the single year 1911. Even in comparison with 1911, moreover, the present ginning season shows only a trivial falling off, the respective figures being 7,610,682 bales this year, compared with 7,758,621 bales for 1911. When account is taken of the scanty market for cotton since the ginning season began, the ruinously low price which cotton has commanded all over the South, the lack of ready money among the farmers wherewith to hire pickers and to pay the cost of ginnnig, it is hard to dispute the assertion that a normal state of things would have caused the October 18 ginning figures to overtop those of 1911 by a large amount, and to indicate decisively the largest crop ever grown in the United States. Under present conditions, to be sure, it would not be safe to make such a prognostication, for as the picking season advances and the picking becomes slow and expensive, the low price obtainable is almost certain to restrain attempts to gather the last scattered cotton in the fields, so that one, two or even three million bales of the crop may never be picked and ginned at all. There can be no doubt, however, that enough will be picked to leave us next Summer with the largest stock of cotton we have ever had on hand at the beginning of a new season. Curiously enough, however, the publication of the Census figures and the realization of what they mean have not had a depressing effect upon the price of cotton in the South. The volume of trading in cotton in the Southern markets is of course exceedingly limited in pronortion to what it normally would be; prices. moreover, show very wide variations from place to place and from day to day. But during the week there has been a very decided stiffening of prices in some of the most important Southern markets. In Houston, Texas, for example, spot cotton was bringing yesterday quite ½ cent per pound more than on the previous Friday. Less striking advances were also made in the markets of the Atlantic States. Of course, this phenomenon does not mean that the total supply of cotton is being more completely absorbed and that demand is brisk enough to give prices a natural lift. What it does mean is that the so-called "distress" cotton has for the most part been sold, and that the farmers who are now bringing their seed-cotton to the gins are financially strong enough to withhold from the market and to carry back to their farms the ginned bales. But the demand, too, is really better; there can be no doubt of that. Cotton is beginning to be bought in respectable quantity for Great Britain, Italy and Spain; American spinners are increasing their purchases; and more than a little has been bought for the account of Germany and Austria. whatever may be the method expected to be adopted for getting it through to its destination. Early in the week, indeed. there was almost an outburst of enthusiasm, when it was announced that, so far as interference from England was concerned, cotton might be shipped in neutral bottoms direct to Hamburg and Bremen. There was much scurrying about on the part of merchants, with the idea of taking prompt advantage of the news by chartering American vessels, loading them with cotton and selling the cotton at the high prices obtaining in the German and Austrian markets. The enthusiasm was, however, of rather short duration; for it was soon discovered that vessel-owners were by no means reassured on the subject of mines along the North Sea shores by benevolent expressions as to the non-contraband character of cotton as a cargo. So far as can be learned, not a single ship was found whose owners were willing to take the risk, and the hope of direct shipments of cotton to German ports now appears decidedly faint. Worse than this, the recent destruction of two ships by floating mines off the West Coast of Ireland has made both vessel-owners and marine insurers decidedly nervous about voyages even to Liverpool and Manchester. It cannot be said, then, that the high hopes for speedily enlarging exports of cotton, which were entertained by many a few days since, bid fair to be speedily realized. The fact is that the real improvement in the situation is in the United States, and that too despite the fact that the whole burden would seem at first sight to rest on American shoulders. Congress has fortunately adjourned without adopting any of the wild financial legislation in behalf of cotton that appeared at one moment not unlikely to be passed. The great $135,000,000 Cotton Loan Fund, to be raised by the banks of the country and managed by the National Reserve Board, is still very much on the front pages of the commercial newspapers; but it would not be surprising if this also showed itself impracticable and in no long time fell into "innocuous desuetude." But the cotton trade is getting its feet under it again, and is beginning to find that the work of restoration accomplished in the past three months has put enough of its troubles behind it to enable it to become once more "forward-looking," active and constructive. The American cotton exchanges should be open before mid-November: Liverpool must speedily follow; and then the immense sustaining power of the consuming world will little by little be brought to the aid of cotton.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The following were the high, low and closing bid prices for each delivery, on Friday, July 31, in cents and hundredths of a cent per pound, gross weight:

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	498,344	545,977	577,104	287,414
Overland to mills and Canada	32,953	43,575	54,033	33,252
So. mill takings, est., exclusive of takings from Southern ports.	85,000	85,000	85,000	65,000
Gain of stocks at interior towns	65,434	59,262	29,991	108,861
Brought into sight for week	681,731	732,614	746,128	494,530
Total Movement—				
Port receipts	3,828,134	3,640,937	3,724,389	1,350,971
Overland to mills and Canada	127,334	121,569	191,205	97,765
Southern mill takings..	625,873	664,796	664,796	353,000
Stocks at interior towns in excess of Sept. 1..	486,785	383,277	347,681	619,324
Brought into sight thus far this season	5,094,385	4,928,071	4,928,071	2,421,060

The total crop movement is respectively for 95 days, 93 days, 92 days and 91 days.

THIRD COTTON GINNING REPORT OF THE SEASON.

On Monday, October 26, the Bureau of the Census issued its third report of the season on cotton ginned from the American crop of 1914-1915. The figures cover the period from the beginning of the season up to October 18. The following table gives the returns by States, with comparisons for last year and for the large crop year, 1911.

COTTON GINNED FOR SEASON TO OCTOBER 18.

States.	1911, Bales.	1913, Bales.	1914, Bales.
Alabama	838,617	839,899	810,786
Arkansas	278,238	322,181	397,031
Florida	43,503	35,956	43,313
Georgia	1,522,718	1,296,911	1,364,013
Louisiana	176,904	164,034	224,968
Mississippi	386,016	435,690	474,330
North Carolina	438,266	252,193	301,077
Oklahoma	396,739	301,258	450,657
South Carolina	788,927	619,720	693,392
Tennessee	125,791	131,933	103,970
Texas	2,700,037	2,451,279	2,712,712
All other States	23,636	32,464	34,433
United States	7,758,621	6,973,518	7,610,682

The amount of cotton ginned from September 25 to October 18, inclusive, was 4,216,929 bales, as compared with 4,082,027 bales ginned in the same period in the season of 1911-1912. In fact, the ginnings for the period this year broke all previous records. Included in the figures for this year were 13,229 round bales (taken as half-bales), as compared with 49,030 last year, 41,745 in 1912, and 53,858 in 1911. Sea Island cotton included amounted to 30,078 bales, compared with 31,139 bales last year, 15,960 bales in 1912, and 40,303 bales in 1911.

The average quantity of cotton ginned prior to October 18 in the last seven years was 6,182,481 bales, or 48.8 per cent of the average of the seven crops.

* * *

Cotton and Cotton Manufacturing Situation in Mexico.—The rapidity with which cotton manufacturing can recover from the effects of even the most ruthless and devastating war is illustrated by the conditions reported as existing in the chief cotton-producing district of Mexico, that about Torreón. It will be remembered that one of the most sanguinary battles between the then revolutionary forces, under General Villa, and the Mexican Federal forces, took place less than a year ago at Torreón. Last year's crop of cotton in the district,—a very large crop,—could not be got southward to the Mexican mills, most of which are in or near Mexico City; and a considerable amount of the cotton was shipped northward into the United States and there sold in the late Spring just past, with small profit to the purchasers, as things

turned out. And yet a recent press despatch from Torreón reads as follows:

"All of the cotton mills of Mexico have been large buyers of the staple during the past several weeks. It is stated that they have closed contracts for more than $6,000,000 worth of cotton, most of which is being supplied by the growers in the Laguna district, in which Torreón is situated. The normal annual crop of this district is a little more than 100,000 bales. The Mexican crop this season was above the average yield and all of it will be consumed by the mills of the country. Considerable cotton from last year's crop was held over on account of the disturbed condition of the country. The held-over cotton has now been sold at fairly good prices and planters are in good financial shape. The mill owners report a heavy demand for certain classes of cotton goods and most of the plants will be kept running full time from now on, unless new revolutionary troubles arise and put a stop to manufacture."

* * *

The Reduction of Cotton Area in Egypt.—It is reported by Mr. Olney Arnold, United States Consul at Cairo, that by a decree published in the Official Journal on September 22 the area to be devoted to cotton in Egypt during the agricultural year 1915 is limited to a maximum of 1,000,000 feddans (feddan equals 1.03 acres), the cultivation of the fibre being entirely prohibited in the basins of Upper Egypt and no owner or tenant being permitted to cultivate cotton over an area exceeding one-fourth of a single agricultural property. In those localities not suited to the growing of grain crops the proportion of land given to cotton may be increased to one-third, but in no case is the maximum of 1,000,000 feddans to be exceeded. An exception is also made as to lands in districts irrigated by water from the Nile and canals. Non-conformance with the decree will entail both a punishment and a fine and the destruction of plantings beyond the legal limit. Wheat, corn, beans, and other grain and food products are to be grown in place of cotton.

* * *

The Cotton Mill Situation in Spain.—Mr. E. Calvet, member for Spain on the International Cotton Committee, writing to the International Federation at Manchester, says: "Since the declaration of war, the spinning mills have been reducing their output, and the manufacturers took the same step shortly afterwards. At the present time both the spinning and the weaving mills are working three days per week, and hardly any sales take place. It is anticipated that this curtailment of output will last at least three months."

NEW YORK QUOTATIONS FOR STANDARD COTTON GOODS AND YARNS

The following are quoted prices in the New York market for typical [illegible] cotton goods (in cents per yard) and cotton yarns (in cents per pound), Saturday of last week and on Wednesday of the present week:

INDUSTRY, COMMERCE AND FINANCE

(Continued from Page 554.)

lined above was approximately $20,850,000. The British income tax yielded a total of slightly over $300,000,000 in 1912.

* * *

Railway Revenues and Expenses in the United States in July.—According to figures issued by the Bureau of Railway Economics, for railways operating 228,136 miles of line, or about 90 per cent of all steam railway mileage in the United States, operating revenues for the month of July, 1914, amounted to $256,404,337. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail and auxiliary operations. Compared with July, 1913, these operating revenues show a decrease of $10,476,467. Total operating revenues per mile averaged $1,124 in July, 1914, and $1,183 in July, 1913, a decrease of $59, or 5.0 per cent.

Operating expenses, which include all the costs of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $178,988,195. This was $9,645,172 less than for July, 1913. These operating expenses per mile of line averaged $785 in July, 1914, and $836 in July, 1913, a decrease of $52 per mile, or 6.2 per cent.

Net operating revenue, that is, total operating revenues of rail and auxiliary operations less operating expenses, amounted to $77,416,142, which was $831,295 less than for July, 1913. Net operating revenue per mile of line averaged $339 in July, 1914, and $346 in July, 1913, a decrease of $7 per mile, or 2.1 per cent.

Taxes for the month of July amounted to $11,387,392, or $50 per mile, an increase of 3.8 per cent over July, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less taxes, averaged $289 per mile of line, and in July, 1913, $298, thus decreasing $9, or 3.1 per cent. Operating income for each mile of line for each day in July averaged $9.33 and in July, 1913, $9.63. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction and for dividends.

The operating ratio for July, that is, the per cent of total operating revenues absorbed in operating expenses, was 69.8 per cent, which is comparable with 70.7 per cent in July, 1913, and 68.1 per cent in July, 1912. The operating ratio in the Eastern district for July was 70.8 per cent, as compared with 72.1 per cent for July, 1913; was 75.2 per cent in the Southern district, as compared with 75.3 per cent in 1913; was 66.8 per cent in the Western district, as compared with 67.5 per cent in 1913.

* * *

Immigration Into the United States in War Time.—According to the monthly bulletin of the Bureau of Immigration just issued, there were admitted into the United States during the month of August, 1914, 37,706 aliens, a falling off of 22,671 from the month of July, 1914. When compared with the total for August, 1913, which was 126,180, the August figures show an even greater decline, the falling off being 88,474. The table printed below sets out the immigration by months during the past three years, and during the first eight months of 1914:

IMMIGRATION INTO THE UNITED STATES BY MONTHS, 1911-1914.

	1914.	1913.	1912.	1911.
August	37,706	126,180	82,377	50,110
July	60,377	138,244	78,101	57,737
June	71,728	176,261	92,425	71,019
May	107,796	137,262	113,635	95,361
April	119,885	136,271	99,839	98,936
March	92,621	96,859	91,185	81,687
February	46,873	59,156	45,380	42,826
January	44,708	46,441	48,453	36,361
Totals, eight months	581,494	917,674	641,395	534,037
December	.....	95,387	76,315	61,620
Totals, twelve months	.....	1,369,219	906,803	835,974
September	.....	451,545	255,408	301,937
November	.....	104,671	94,739	61,765
October	.....	135,140	108,300	69,418

It is possible, on the basis of these figures, to make an intelligent guess at the probable results for the full year, 1914. It appears that the number of immigrants who arrived during the first eight months of 1913 is 67.0 per cent of the number arrived during the calendar year 1913; the number during the first eight months of 1912, 71.5 per cent of the total for that year; and the number during the first eight months of 1911, 63.8 per cent of the 1911 total. If the ratio between 1914 and 1913 at present existing is maintained throughout the remainder of the year, the total immigration for 1914 will amount to 867,900. On the basis of the average ratio between the 1914 eight months' figures and those of the first eight months of the past three years, the total for 1914 will be 862,602.

Possibly a more accurate basis for estimating the immigration figures for the remaining months of 1914 would be a comparison of the results for last August with those for August during the past few years. The August results of the present year must be taken to be typical of war conditions. They comprise 29.3 per cent of the returns for August, 1913. If the returns for the remaining four months of the year continue in the same proportion, the 1914 total will be lower than either of the estimates mentioned above, or 735,604. This would put us on an annual basis lower than that of any year since 1902. For reference, we give below the annual immigration into this country during the past twenty years, as recorded in the Statistical Abstract of the United States:

ANNUAL IMMIGRATION INTO THE UNITED STATES, 1892-1914.
YEARS ENDED JUNE 30.*

1892	623,084	1904	812,870
1893	502,917	1905	1,026,499
1894	314,467	1906	1,100,735
1895	279,948	1907	1,285,349
1896	343,267	1908	782,870
1897	230,832	1909	751,786
1898	229,299	1910	1,041,570
1899	311,715	1911	878,587
1900	448,572	1912	838,172
1901	487,918	1913	1,197,892
1902	648,743	1914	1,218,480
1903	856,046		

*Exclusive of immigrants debarred from landing.

W. B. MARSH, Business Manager

IT has been remarked before this in these pages that an apparently contrarious effect of a continuous rise in the rent,—i. e. rate of interest or market price,—of capital is to make the owners of capital, or of the evidences of ownership of it, generally lament their misfortune in becoming daily poorer. Though the only benefit they obtain from their capital is the rent they can derive from it, and although at first sight a rise in this rent would seem to be all to their advantage, yet it universally happens that the capitalist class is despondent and dissatisfied during periods of increasing capital rent, while periods of declining capital rent find them correspondingly elated. The explanation is to be found in psychology and nowhere else. Of course, a correlative of a rising rent, or interest rate, for capital is a declining market price of all pre-existing capital investments at a fixed rent, or rate of interest; and the longer the unexpired term of such investments the more severe is this decline in their market value. The owner, or investor, to be sure, receives from his investment as much as he had expected to receive from it, when he made it; but if he desires to pass the investment on to another, by selling it in the market, he must take for it a smaller sum in cash than he had paid. Even if he keeps his investment, he finds through consultation of the market quotations, that the market value of it has diminished, and he concludes himself poorer by so much. And this apparent depreciation of his property invariably exercises a depressing effect upon the investor's mind, in spite of the fact that on any of his new investments he can obtain a higher rent, or rate of interest, than he perhaps even could before, and that his position *qua* capitalist is a steadily improving one.

It cannot be denied, however, that a period of change in the rate of interest, or market price of capital, brings with it very serious problems and even embarrassment in more than one department of financial operations; and that this is particularly true when the rate of interest is rising, while the market or selling value of fixed investments at the old rate of interest is correspondingly declining. When the opposite phenomenon is showing itself,—i. e. when the rate of interest is falling and the market value of fixed investments is rising,—the constantly registered increase in the present worth of all kinds of income-producing property facilitates the easy operation of accountancy, that universally employed yet in some respects unreliable method of measuring the soundness or unsoundness of credit, the solvency or insolvency of all those persons or bodies corporate that have entered into financial obligations to others. As it is the primary assumption of accountancy that the criterion of the ability to meet obligations is the relation between the amount of the obligations and the present market worth of the property whose conservation and use must produce the wherewithal to meet the obligations, any cause that affects favorably the present market worth of the property in hand is a help to the making of solvent balance-sheets, and any cause that affects that worth unfavorably is disturbing and may be superficially alarming.

Naturally, it is fiduciary institutions of various kinds that are subjected to the most difficulties by reason of changes in the present market value of the capital investments held by them for the fulfilment of the obligations they have undertaken. Banks of all kinds are obviously affected, and particularly savings banks. Insurance companies likewise, in different degrees according to the branches of insurance in which they are engaged, are exposed to unfavorable effects in their balance-sheets from being obliged to take into account there only the immediate selling value of their securities, while they get no accounting benefit from the steadily rising average rate of return upon their investments as a whole. An increase of one-half per cent, three-quarters per cent or perhaps even one per cent in the average annual rate of interest earned by a great insurance company means in itself a tremendously important improvement in the financial situation of the company, from the point of view of the real advantage of the policyholders; yet the anomaly arises that, on a strict application of the present theory of accounting, this great boon to the policyholders may on the face of things render the company insolvent. That is, the resultant shrinkage in the book-value of the company's assets may be so great as to bring about a balance-sheet deficit, impairment of capital or reserves, and the statutory necessity of winding up the company's affairs. Perhaps even more striking are the embarrassing consequences of a rising interest rate and a declining market value of investments for a savings bank; for in its case, there is a twofold obligation towards the depositors,—first, to earn as high a rate of interest as possible on their deposits, and, second, to have their principal intact to hand back to them, whenever they may call for it. Obviously, the latter of these obligations permits of no accommodations in the matter of the valuations taken for balance-sheet purposes. The obligations to the depositors are for cash deposited; and the valued inventory must show the wherewithal to return this cash unimpaired. It is only government savings banks that can palter with this supreme duty. It is known, for example, that the British Postal Savings Bank, which invests its deposits chiefly in Consols and other governmental securities, cannot to-day make a balance-sheet, without showing an accounting deficit of something over fifty million dollars. Every decline in the

market price of Consols makes this bank's situation the worse. In the same way, there can be little doubt that one outcome of the present European War will be to leave practically all the savings banks of the belligerent countries technically insolvent. They really have no choice about subscribing for the vast government loans issued for the carrying-on of the war; and with each new issue of an amount of five hundred to a thousand million dollars (using terms of money of this country), the interest rate must go up, while the selling value of all anterior issues, as well as of all older investments, must go down. A great governmental problem will thus be developed; and profound modifications of the theory and practice of savings banks, at least in countries other than our own, may be expected to result.

It goes without saying that, while a gradual increase in the interest rate and a corresponding gradual decline in the market value of anterior investments produces real embarrassments of the kind just described for fiduciary institutions, any sudden and violent acceleration of the process must result in acute disturbances, requiring drastic remedies. For a decade past there has been a decided tendency for the interest rate upon capital to rise, owing to the world-wide competition for capital; and for the selling price of older investments to fall. As a result, the managers of fiduciary institutions all over the world have been obliged to provide year after year for a considerable writing down of the book-values of their assets, thus including in their operating expenses a heavy item of which the general public has known next to nothing. It is an admirable illustration of the skill and fidelity with which the affairs of such institutions are generally conducted in modern civilized countries that shrinkages of this kind aggregating an absolutely staggering amount have been quietly provided for, without affecting the solvency of the institutions as a body and without harming or even alarming the public in any way. Such was the course of events, so long as the primary cause of the rising rate of interest was simply the greater and greater pressure of the countries of the world, old and new, to obtain capital for their economic or quasi-economic use.

The European War, however, has made a violent change in this orderly, even if temporarily uncomfortable, process. The managers of fiduciary institutions to-day must deal with an extraordinary exaggeration of their problem. It is entirely plain to every one competent in these matters that the market values of existing investments must not only suffer temporarily by reason of the general economic disturbance occasioned by the war, but also undergo a permanent severe decline, or a decline for a period of years, because of the sudden jump of the rent for capital, or interest rate, which will attend the sudden injection into the mass of the world's securities, of the monster government loans which the belligerent nations must float. Whichever of the numerous estimates of the ultimate cost of the war one may take, it is impossible even now to place at less than ten billions of dollars the aggregate of these loans; and before the war is concluded, the amount may easily have risen to twice or thrice this sum. Nothing like this, from a financial-economic point of view, has ever before happened, and we have no experience of the past by means of which to estimate the effects. We do know, however, that there is but one way in which the collection of so enormous an amount of capital can be accomplished. The world's annual savings are completely inadequate to provide it, and it must be got by drawing it away from other employment. The interest rate is the means of doing this; and the European countries must bid so high for capital, in the way of the interest rate they offer, that the ordinary economic employments of capital cannot compete with them. It would be hazardous to say how high this rate will prove to be; but it is safe enough to assert that it will be so much higher than civilized countries have ever before paid for capital that the interest rate from one end of the world to the other will advance with a great leap. And the effect of this upon the market values of pre-existing investments will be proportionately severe.

During the three months since the outbreak of the European War, by general consent this larger and more enduring problem arising from it has been postponed, until the immediate wreckage could be cleared away, the strained and partially disabled machinery of day-to-day business could be repaired and got into operation again, and some approach to the orderly conduct of affairs could be achieved. But indefinite delay is not possible in such matters. The mere succession of appointed periods of time compels practical decisions, which in their turn must rest upon some kind of theoretical conclusions as to the present and the future conditions that must be dealt with and what is involved in them. A good illustration of this is afforded at this moment here in the United States. The end of the year is approaching, and when it arrives two great classes of our fiduciary institutions,—our savings banks and our insurance companies,—must under the law make up their annual statements of account and show themselves either solvent or insolvent from a technical accounting point of view. Both classes of institutions hold in the aggregate enormous amounts of investments made in the course of years past, when the interest rate was not only lower than it had recently come to be even before the European War broke out, but also vastly lower than it must be for many years to come. The market values of these investments has already been severely affected, notwithstanding that their inherent soundness is just as great as ever it was, but simply because, given inherent soundness, the market value of all securities simply reflects the market price, or interest rate, for capital in the world's financial centres. And yet balance-sheets must be drawn off annually by savings banks and insurance companies, and must show assets sufficient to balance obligations, with both assets and obligations expressed in terms of immediate cash.

Fortunately for our insurance companies, in this instance, the problem of accommodating values to conditions is under our laws not theirs, but that of the Insurance Departments of our States, which co-operate for the purpose of securing uniformity. The Committee on Valuation of Securities of the National Convention of Insurance Commissioners has just decided upon the basis of valuation for the present year. It is to be for stock exchange securities the quoted prices of June 30th, and for other securities correlative prices worked out at the same general level by the well-known expert appraiser of securities, Mr. Marvyn Scudder. The reasons for this determination have been given by Superintendent of Insurance Hasbrouck, of New York, as follows:

"Conditions prevailing on June 30 were such that the

prices then obtainable represented normal conditions. Immediately thereafter rumors of war and the declaration of war caused a marked decline in the value of securities. It would be unfair to penalize our insurance companies for a condition that is only temporary. There is no doubt at all that the intrinsic value of securities held by insurance companies has remained unchanged and that the decline in prices will be only temporary."

We do not quarrel with the practical conclusion reached by the Insurance Commisisoners for the present occasion; but we are compelled to say that, if they have based this conclusion upon the belief that the "decline in prices [shown in the markets after June 30] will be only temporary," and that they have disposed of the problem for good, they are mightily mistaken. Before another year has revolved they will certainly find that, not temporary, but to all intents and purposes permanent forces have depressed and are still depressing the market values of all investments made at the interest rates prevailing during the past twenty years. This is going to be one of the greatest of all the financial problems with which modern society has ever had to deal; and we cannot help wondering whether a committee of insurance commissioners will be able to solve it.

Arthur Richmond Marsh

THE PERSONAL ELEMENT IN OUR TRADE WITH SOUTH AMERICA

By Charles L. Chandler,

South American Agent, Southern Railway, Mobile and Ohio Railway, etc. Formerly of the United States Consular Service.

[In an address on "The Railroads and Export Trade" before the National Foreign Trade Convention, at Washington, D. C., on May 27, 1914, Mr. Fairfax Harrison, President of the Southern Railway Company, outlined the opportunity of our Southern railroads to participate in the development of closer trade relations between the United States and the South American countries and the work which was being done to further this end.

"The problem," he said, "is to bring about a larger development of our trade with those countries and to have it carried on through the ports served by our lines. With the view to bringing this about, we have appointed a South American Agent, attached to the Freight Traffic Departments of the companies. The qualifications needed for this important post were carefully considered. The man selected was for a long time in the United States consular service in Europe, Asia and South America. He knows the South American people and speaks and writes their languages. He knows what the markets of each country want and how they want it packed and shipped. He is familiar with their customs laws and port regulations; with their methods of doing business, and their credit systems. He knows what each of these countries produces that is in demand in the United States. It is his duty, by personal interviews and correspondence, to interest manufacturers and merchants in all of the territory from which shipments can advantageously be made through Southern ports in building up a Latin-American trade. He supplies them with detailed and accurate information as to each market in which they may be interested, and will aid them in putting their letters and advertising matter into Portuguese for Brazil and into Spanish for the other countries. He will have access to all of the foreign trade information collected by the various Government Bureaus in Washington, and will aim to maintain such relations with the diplomatic representatives of the Latin-American countries in the United States and with commercial bodies in those countries as will enable him to obtain prompt information relative to the special wants of their markets, as to prospective governmental or private purchases, and as to the letting of contracts for materials or construction.

"This is a new departure in railroad administration, but we believe that it is one that will be profitable to the companies both directly through the increase in traffic to and from the ports served by them and indirectly through advancing the prosperity of the seaport cities and of the producing localities along their lines."

The man chosen to fill the important post of South American Agent above referred to is Mr. Charles L. Chandler, to whom we are indebted for the following article. Mr. Chandler has consented to discuss from time to time in the pages of THE MARKET WORLD AND CHRONICLE important phases of our South American trade.—Editor.]

THE elementary features of our export activities are slowly crystalizing into more technically analytic studies of all phases of our foreign trade. For instance, co-operative foreign marketing is slowly becoming more generally understood and practiced; our consular service is being reorganized; and the railways are devoting far more attention to their export trade than was the case five years ago. It should be constantly borne in mind that the study of export work is one in which only constant practice and performance can entitle a person to be considered skilled in all its variations. An export expert cannot be made in a day from a man who merely knows a foreign language; even a broad and systematically analytic study of the different South American countries, for instance, such as can only be gained by a close reading of the standard books thereon, supplemented by pertinent inquiries from those exporting different lines of goods thereto, often does not in itself make a man really skilled in this field. What is most needed now is closer contact with the South Americans, and an increase of mutual understanding and confidence.

The export trade has come on many of our manufacturers unawares; it is merely a new toy to many of them. "What's the use of adapting my plows to the needs of those people in Natal?" says Manufacturer A. But let him look at the bank account of Manufacturer B, three-eighths of whose business is export; he has one type of plow for South Africa, and one for Argentina; he is making expensive changes in his plant to develop yet another field.

I know a firm in Pennsylvania that did not discharge a single man when the panic of 1907 came. They had built up an export business in thirty-four different countries; and during that hard year their factory was busy, while many of their competitors were forced to run on half-time, or even close their plants entirely.

We can sell our goods anywhere. Our first really carefully worked export fields—when Salem had more shipping than New York—were Portugal and Mauritius. But to-day the real test of export pre-eminence is the amount of business obtained in the world's competitive markets. The greatest of these are the Latin-American countries, particularly the countries of South America. There lies to the south of us a Continent of fifty million inhabitants, with the world's record for scanty population, and most of that population made up of non-purchasers, the percentage running as high as 82 per cent in Peru. And yet they buy from the world at large very nearly a thousand million dollars' worth of goods a year. There is no manufacturing there,—we had more manufacturing in 1840 than South America has to-day.

The United States supplies South America with only about a tenth of the imports into that Continent, though our export business to that region has been going on since 1748. We had a greater proportionate share of it in 1848 than we have to-day. Our direct trade with Argentina dates back to 1806, and there are United States business houses in Brazil and Argentina to-day that have been in continuous operation since 1820. The first locomotive and the first steamer ever sent to South America were from the United States; Allan Campbell built the New York Central and the first Argentine railway. In the early days our business with South America was more direct than at present. The famous "Cleopatra's Barge" sailed from Rio de Janeiro on January 31, 1819, for Salem, Mass., with a cargo of hides, sugar, coffee and tapioca, which she had obtained there in exchange for New England manufactured products. A year later we find the cargo of Mr. Thomas H. Perkins' brig "Macedonian," from Boston, consigned to Messrs. Arismendi and Abadia, of Lima, valued at $145,000.

How can we get away from Europe some of that $800,000,000

that the South Americans are paying her for goods and merchandise of all kinds? It is not going to be done in day, or a week, or a year. We have made many mistakes in the past, and are still making them, because of our hasty methods, our utter lack of scientific management in foreign business relations. We have failed to educate our own people in fundamental South American conditions, and have trusted to foreigners to obtain business for us. It has been extremely difficult, in spite of high salary returns, to obtain young men of the right type, trained in export work as a profession. Our salesmen have failed to study the customs of the foreign countries, their wants and prejudices; and our national ignorance of Spanish and other modern languages and of commercial geography is unique among the great commercial nations. I recently asked a room-full of school teachers, who were supposed to be equipped for commercial instruction, and most of whom had Ph. D.'s, where Cordoba, Christchurch and Caracas were, and only two of fifty-four could give a correct answer. Yet we glibly talk of conquering the world's markets. Commercial battles nowadays are not fought that way.

Our goods sold in South America are of two distinct kinds: first, non-competitive goods, such as agricultural implements and machinery, various other mechanical devices, such as cash registers, and raw products, such as lumber of all kinds; and, second, articles in which we compete with European or Japanese manufacturers,—articles which our competitors can, it is alleged, manufacture very much cheaper and better, and distribute with a more scientific view to future orders, than we can. Cotton goods of all kinds and shoes are important items in this class.

While admitting that there are some articles of which it may be true that they are so cheaply produced as to prohibit competition by the United States, yet the problem of winning these markets is by no means a hopeless one. For instance, ten years ago we were a debtor country as regards automobiles, importing heavily from Europe; to-day American-made automobiles and motor vehicles of all kinds are closely competing with the French, German, Italian and other European machines in Buenos Aires, Montevideo, Rio de Janeiro and other South American points. An important point to be noted in this connection is that when European articles compete with those from the United States in South America, they sell at an average of as much as from one-tenth to one-half cheaper. This handicap may sometimes be overcome by the superior quality of the American article; but before attempting to compete, the manufacturer or exporter in the United States should carefully ascertain all possible information regarding the nature of the competition to be met, and especially whether the proprietors or directors of the European firms with which he is competing are financially or otherwise interested in steamship lines from Europe to South America, or in railway lines or other means of communication in the various republics of that Continent.

Again, it should always be remembered that questions of quality and local demand or prejudice are often constantly so interwoven that it takes time to create a local fancy for an article, and that the smallest trifle may upset the regard for the quality of a particular class of goods. Another of the far-reaching mistakes made by American business men in regard to South American trade has been their wasted energy in connection with the sale of non-competitive goods and raw products, for which there existed a good market even without their efforts. It is obviously more important to take away a contract or order that would otherwise be filled with competitive goods from Europe and secure it for the United States. There is no reason why Chile should buy 416 tons of shovels from the United Kingdom and only 67 tons from the United States.

Through an examination of the physiographic characteristics of South America much valuable information can be gained by the would-be exporter. The differences between temperate and tropical South America are as distinct and fundamental as those between Siam and Siberia or Canada and Jamaica. Twenty-four and six-tenths per cent, or approximately a quarter of the South American Continent, is temperate in climate. Roughly speaking, this embraces Argentina, Chile and Uruguay, and the States of Rio Grande do Sul and Santa Catherina, Brazil, with some of Southern Paraguay. This temperate quarter of the Continent contains between a quarter and a third,—some 28 per cent,—of its total population, but it also contains at least 75 per cent of the white population thereof, and transacts between a half and two-thirds of its total foreign trade. The commercial development of temperate South America has been much more rapid than the tropical. The temperate part tends to dominate the tropical, as has occurred in China and South Africa. Argentina takes 40 per cent of our total trade with South America.

Slavery was abolished in Argentina, Chile and Uruguay before 1813, and in a very few years all the negroes were removed from the country. To-day the population of Argentina and Uruguay is 95 per cent pure white, and is mainly composed of assimilative stocks of people, from certain parts of Spain and Italy, with a few from Northern Europe who possess a high co-efficient of mental and physical efficiency which is generally transmitted to their children on their inter-marriage with their fellow-citizens of Latin origin. This temperate climate in Argentina, Uruguay and Chile has bred healthily energetic men and has encouraged and attracted white immigrants who could build a new country of settlement. This has an important bearing upon trade with these countries. It was a maxim of the Hansa traders of the Middle Ages to see the color of the purchaser's skin and the richness of his coat before they bargained with him. An Argentine wants the best there is; why shouldn't he? He is a white man. It would surprise many Americans to find that he knows far more about the United States than they know of Argentina. In my college days in Buenos Aires I wondered how many of my Harvard acquaintances could have told a quarter as much of Argentine history as my Argentine friends knew of United States history.

To be more specific, Argentina has the greatest per capita foreign trade of any country in the world, and Uruguay, with 1,300,000 people, has one of $80 per capita. Ask an American business man which buys more from the United States, the Chinaman or the Uruguayan. The average Chinaman bought less than a cent's worth from the United States last year; the average Uruguayan a little over seven dollars. Our exporters should consider carefully the question as to the real Open Door. The Argentine gentlemen wakes up in the morning and takes his clothes, probably made by an English tailor in Buenos Aires from English cloth, from his chair; his suite of bedroom furniture was probably made by Maple of London, which firm maintains a large branch store in Buenos Aires. His razor was probably made in Germany; his shaving soap may be American, though a well-known druggist in Buenos Aires bitterly complained to me a few years ago that some of our largest drug firms treated their trade there as a joke. He turns on his English faucet to get a drink of water. That water should be running through pipes made in the United States, but we have not really tried for the business. Two years ago word was received in this country that the Argentine Government had appropriated $34,000,000 for water pipes. One American firm sent a catalogue there. It was printed in English and all the weights and measures were set out in anything but the metric system. It was promptly consigned to the waste basket. Our Argentine friend

sits down to his coffee and rolls; is his coffee served in an American cup? Many is the case of crockery that has been smashed to bits long before it ever saw the River Plate. Does he want a little jam with his bread? It is Crosse and Blackwell's, probably; they have a splendidly organized export department. Then he goes to his office. Here his English desk is as good as those of his correspondents in New York or Chicago. He probably does not use American ink; one of our ink firms sent circulars in English to a French agent in Buenos Aires to show to Spanish-speaking people at an exposition there. His typewriter is an American one; 88 per cent of Argentine typewriters are. But if he goes to his club, he rarely sees any illustrated American papers. His boy in school studies from textbooks printed in Europe. All the medical schoolbooks are printed in French; the library of the medical school in Buenos Aires is as large as that any medical school in the United States.

As to the $34,000,000 contract referred to above, it is a matter of record that it went to an English hardware firm which had long been established in Buenos Aires. Its representatives were gentlemen who had made positions for themselves in the community. They patiently complied with every requirement the Argentines propounded. They never lost their temper. They looked at the matter from the Argentine point of view. The result was an order amounting to many millions of dollars.

And the Germans use the same methods. No order is too small for them, nothing too minute for their study. They got an order for a bridge in Uruguay—it was only $10,000, and some of our countrymen sneered at it. But a little later, as that job was well done, a $500,000 job came their way. It is obvious that much patient study, a considerable money investment, and the securing of a recognized position in the South American confidence must precede any permanent and extensive competition with established European firms in South America. But it is equally true that the pool is full of splendid fish which can be caught if the hooks are properly baited.

THE BEGINNING OF OPERATION OF THE FEDERAL RESERVE BANKS

THE date fixed for the beginning of actual operation of the new Federal Reserve System is Monday, November 16. All the preliminary steps in the way of election and appointment of the several classes of directors of the Reserve Banks, selection of governors and chairmen of boards of directors, and in large part appointment of the staff of bank officers, have now been taken. Hence the time has come for inaugurating the transaction of the business which the Reserve Banks, in conjunction with the Federal Reserve Board, are designed to conduct.

In its November bulletin the National City Bank of New York summarizes the last stage of preparation for this event, of such vast consequence to the entire commerce and industry of the United States. Furthermore, the bulletin gives in convenient form the figures of the subscribed capital (in so far as National banks are concerned) which the Reserve Banks will have at their disposal; the figures for the reserves of the National banks in the several Federal Reserve Districts, both as they have been under the old law and as they will be under the Federal Reserve Act; and the figures for the cash resources of the National banks and the distribution of the same between the banks' own vaults and the Federal Reserve Banks under the new system. With some omissions and some rearrangement the summary is as follows:

* * *

The following is the official statement of the Secretary of the Treasury announcing November 16, 1914, as the day determined by him for the actual beginning of the new banking system:

"The Federal Reserve Act imposes upon the Secretary of the Treasury the duty of announcing 'in such manner as he may elect the establishment of a Federal Reserve Bank in any district.' In the discharge of that duty I have determined to announce on the 16th day of November, 1914, the establishment of the Federal Reserve Banks in all the Federal Reserve districts. On that date the new reserve requirements for national banks, as prescribed by the act, will become operative.

"I am impelled to this decision particularly because of the emergent conditions in the South and the confident belief that the prompt opening of the Reserve Banks will be very helpful to the cotton situation and to general business in all sections of the country.

"This conclusion has been reached after a thorough discussion with my associates on the Federal Reserve Board, who are co-operating cordially with me, and also after full consideration of the views expressed by the directors of the Federal Reserve Banks at their recent conference in Washington with the Federal Reserve Board.

"I am fully aware of the physical difficulties that must be overcome to set the reserve banks in motion on the 16th of November, but the directors of these banks represent the highest degree of American banking ability, and I am sure that not only can they meet the situation but that they will cheerfully take up the task in the same fine spirit of public service which animated their discussions at the Washington conference.

"As the result of the enactment of the war revenue measure the parity between receipts and disbursements of the Treasury will soon be happily restored. This will make it possible for the Treasury to render still greater service than it has already rendered in helping the financial situation in the South, and in other parts of the country where the need has appeared.

"The prompt opening of the Federal Reserve Banks will make the assistance of the Treasury doubly powerful because the Federal Reserve Act authorizes the Secretary of the Treasury, in his discretion, to deposit a large amount of the moneys held in the "general fund" in the Federal Reserve Banks, and to require such banks to act as fiscal agents of the United States; and also, in his discretion to deposit the revenues of the Government, or any part thereof, in the Reserve Banks, and to make disbursements by checks drawn against such deposits.

"Under the present system the Secretary of the Treasury cannot with prudence scatter the 'general fund' of the Treasury among the great number of widely separated National banks throughout the country. Up to the present I have gone as far in that direction as I have felt that it was Act and the use which I may be able to make of the Federal Reserve wise to go, but with the larger powers conferred by the Federal Reserve Banks as fiscal agents of the Government it will be prudent and wise to deposit a large amount of the 'general fund' of the Treasury in the Federal Reserve Banks.

"As soon therefore as the Reserve Banks are in operation I shall transfer to them as large an amount of Government funds as possible. This will in turn enable them to extend enlarged credits to National banks and State banks which may become members of the Federal Reserve system, which they in turn may extend to their customers. By this means and through the agency of the Federal Reserve Banks I hope to give additional assistance to that already given by the Treasury Department to the cotton producers, the cotton industry, and the business men of the South.

"The new reserve requirements which will become operative on November 16, upon the opening of the Federal Reserve Banks, will release more than $400,000,000 of reserve money and largely increase the credit facilities of the banks of the country."

The following are the governors of the twelve Federal Reserve Banks:

Dist. No. 1. Boston—Alfred L. Aiken.
No. 2. New York—Benjamin Strong, Jr.
No. 3. Philadelphia—Charles J. Rhoads.
No. 4. Cleveland—E. R. Fancher.
No. 5. Richmond—George J. Seay.
No. 6. Atlanta—Joseph A. McCord.
No. 7. Chicago—James B. McDougal.
No. 8. St. Louis—Rolla Wells.
No. 9. Minneapolis—Theodore Wold.
No. 10. Kansas City—Charles M. Sawyer.
No. 11. Dallas—Oscar Wells.
No. 12. San Francisco—Archibald Kains.

The first meeting of Federal Reserve Directors was held in Washington on October 20, at which time it was announced by

the Secretary of the Treasury, "That it was the hope of the Board that the system would be put in operation at the earliest possible date, and the opinion had been expressed that by Monday, November 16, the Reserve Bank could open (by which time the Federal Reserve Notes were promised for delivery), not to perform all their functions, but to undertake at least some of them. No elaborate system was expected at the moment of opening, but it would be necessary to prepare to receive reserve deposits from the banks and to have rediscount machinery ready for such part of the reserve as would be paid in by the banks."

Under date of October 26 assessment was made upon all member banks to pay into their respective Federal Reserve Banks on November 2, as a contribution to the capital of the latter, an amount equal to one per cent of each member bank's capital and surplus. The assessment covers one-sixth of the total contribution toward capitalization of the Federal Reserve Banks which member banks may be called on to pay; three per cent must be paid in and the remaining three per cent may or may not be called, as the Federal Reserve Board shall determine.

A uniform system of accounting has already been adopted by nine out of the twelve Federal Reserve Banks, while two others have practically determined in favor of such a system; and it is expected that the remaining Federal Reserve Bank will have acquiesced in its adoption before the opening of the banks on November 16.

All reserves required by the Federal Reserve Act to be kept by member banks with Federal Reserve Banks must be transferred to such Federal Reserve Banks on the day of opening, November 16, 1914. In other words, the provisions of the Act relative to reserves will in all respects become effective on that date.

The following is the order of the Federal Reserve Board relative to transfer of reserves to Federal Reserve Banks, from which it will be seen that they are to be transferred in gold or lawful money:

Washington, D. C., October 28, 1914.

To All Member Banks:

The Secretary of the Treasury having advised the Federal Reserve Board that formal notice of the establishment of the several Federal Reserve Banks will be given to all member banks on November 16, it is necessary that arrangements be now made for the transfer of required reserves by the member banks to their respective Federal Reserve Banks. It is the desire of the Board to arrange for the actual physical transfer of the first installment in such a manner as to create the least possible disturbance to business conditions in any city or section.

It is, of course, clear that if the banks in non-reserve cities undertake to make the necessary deposit of reserves with their Federal Reserve Bank by remitting checks or drafts on banks in reserve cities (which checks or drafts can be received by the Federal Reserve Bank for collection only), there may result an unnecessarily heavy withdrawal of funds from the banks in reserve cities. In the same manner, if banks in reserve cities make remittances of checks or drafts on banks in central reserve cities, an unnecessary burden may be placed on the latter.

The deposits of reserves with Federal Reserve Banks must be made in gold or lawful money, and in order that the withdrawal of funds from the vaults of member banks may be as nearly uniform as possible, and so distributed as to relieve any particular section or sections, of unnecessary burden, the Federal Reserve Board urges all banks to ship from their own vaults gold or lawful money. The Federal Reserve Banks have been authorized to assume and pay the express charges involved in making such shipments.

The foregoing suggestions also apply to payments on account of the first installment of capital stock due November 2.

In view of the advantage to be derived from the deposits of gold, which may be used as reserve for Federal Reserve notes it is strongly urged by the Board that deposits of reserves in the Federal Reserve Banks be made, so far as practicable, in gold or gold certificates. DUE notice of the establishment of the Federal Reserve Banks on November 16 will be sent each member bank by the Secretary of the Treasury, and no transfer of reserve can be made until this is done.

Member banks of large resources will greatly facilitate the physical work of counting reserve money if they will send gold certificates in as large denominations as possible or clearing house orders calling for gold certificates or gold already counted by the clearing houses. The Federal Reserve Board appeals to the patriotic spirit of all member banks, large and small, to do their utmost in facilitating the difficult work now thrown upon the officers of the newly created Reserve Banks, and to do all in their power to secure for the new system the greatest possible success from the beginning.

(Signed) H. PARKER WILLIS, Secretary. (Signed) CHARLES S. HAMLIN, Governor.

The above order calls for the payment of reserves in gold or lawful money, but makes no mention of the following provision in Section 19 of the Federal Reserve Act:

"Any Federal Reserve Bank may receive from the member banks as reserves, not exceeding one-half of each installment, eligible paper as described in section fourteen properly indorsed and acceptable to the said reserve bank."

The capital which the several Federal Reserve Banks will have through the stock subscriptions of the member banks in their districts, in so far as these member banks are National banks, is shown in the following table, on the basis of the capital and surplus, shown by the subscribing National banks on March 4, 1914. The amount of subscribed capital that may come from the voluntary adhesion of State banks and trust companies it is as yet impossible to forecast.

SUBSCRIPTIONS OF MEMBER BANKS TO STOCK OF FEDERAL RESERVE BANKS.

(Based on Consolidated Report of National Banks, March 4, 1914.)

District No.	Federal Reserve Cities.	No. of Banks.	Capital and Surplus.	Six Per Cent Subscription.
1	Boston	445	$165,409,043	$9,924,543
2	New York	477	343,693,437	20,621,606
3	Philadelphia	757	208,135,631	12,488,138
4	Cleveland	767	200,123,060	12,007,384
5	Richmond	475	105,055,023	6,303,301
6	Atlanta	372	77,353,221	4,641,193
7	Chicago	952	207,997,941	12,479,876
8	St. Louis	458	83,179,348	4,990,761
9	Minneapolis	687	78,382,081	4,702,925
10	Kansas City	836	93,166,912	5,590,015
11	Dallas	731	92,333,673	5,540,020
12	San Francisco	514	130,422,921	7,825,375
		7,471	$1,785,252,291	$107,115,137

The Federal Reserve Act modifies greatly the reserve requirements of the old National Banking Act. The net result is to decrease materially the aggregate reserves called for as against a given amount of deposits. Thus, taking the consolidated statement of the condition of the National banks of the country on September 12, 1914, it is found that the reserve requirements against the deposits there shown would under the Federal Reserve Act be $580,000,000 less than the banks actually held on that date and $464,000,000 less than they were required to hold under the National Pank Act. The following table shows the working out of this for each of the twelve districts:

RESERVE CHANGES UNDER FEDERAL RESERVE ACT.

Dist. No.		Total Reserve Held by Banks Sept. 12, '14 (Millions).	Total Reserve Required Under Present Law (Millions).	T'l Reserve Required Under Fed. Res've Act (Millions).	T'l Res. Sept. 12, 1914, Held In Excess of Amount Requir'd Under New Law (Millions).
1	(Boston)	129	110	76	53
2	(New York)	364	388	281	83
3	(Philadelphia)	175	153	105	70
4	(Cleveland)	154	144	95	59
5	(Richmond)	64	64	43	21
6	(Atlanta)	38	34	24	14
7	(Chicago)	228	203	140	88
8	(St. Louis)	55	55	37	18
9	(Minneapolis)	91	78	48	43
10	(Kansas City)	109	85	52	57
11	(Dallas)	52	42	28	24
12	(San Francisco)	117	104	67	50
	Totals	1,576	1,460	996	580

Figures have been compiled showing that the reserve under

the present law is $1,460,711,345, while under the Federal Reserve Act the total requirement will be $995,792,269, thus releasing $464,919,076 of the reserves held at the time of the last call of the Comptroller, September 12, 1914.

In the same way as with the reserves, the cash requirements under the Federal Reserve Act are modified from those of the National Bank Act in the direction of a considerable diminution in the amount of cash which the banks are compelled to keep on hand. This appears from the following table, the National bank statement of September 12, 1914, being again taken as the basis:

CASH CHANGES UNDER FEDERAL RESERVE ACT.

Districts.	Total Cash Held Sept. 12, 1914. Millions.	Cash Required to be Held — In Vault. Millions.	with F. R. Bank. Millions.	Either Vault or F. R. Bank. Millions.	Total Cash Required.	T'l Cash Released.
1 Boston	57	31	14	..	45	12
2 New York	307	98	97	62	257	50
3 Philadelphia	74	43	19	..	62	12
4 Cleveland	73	33	17	..	56	17

INDUSTRY, COMMERCE AND FINANCE

Joint Stock Companies in Great Britain.—The report of the Comptroller of the Companies' Department of the British Board of Trade for 1913 has recently been issued. It states that, according to the returns of the Registrar of Joint Stock Companies, the number of new companies registered in England and Wales during the year was 6,871; from which should be deducted: companies which have gone into liquidation, 1,938; companies removed from the register as no longer carrying on business, 1,035; net increase, 3,898. The number on the register on December 31, excluding companies which were in course of liquidation or removal from the register, was about 56,500. The number of companies on the registers in the United Kingdom on the same date was about 63,000. The number of cases in which winding-up proceedings were begun during 1913 is as follows: Voluntary liquidations, 1,799; voluntary liquidations, subject to the supervision of the court, 10; compulsory liquidations, 137; total, 1,946. In one case of compulsory liquidation the winding-up proceedings were stayed, bringing the total down to 1,945.

Source of Subscriptions to the First German War Loan.—The rapidity and ease with which the first 5 per cent war loan of about $1,100,000,000, issued by the German Government at 97½, was reported to have been taken up by German subscribers, excited no little comment in the great financial markets outside Germany. All the statistical material available with regard to economic conditions in Germany had indicated that, while the industrial and commercial progress of the country during the past generation had been immense, the amount of *free* capital was relatively below rather than above what is to be found in the other great commercial nations. The figures had appeared to show that in Germany capital is generally tied up in fixed investments of one or another kind quite as rapidly as it is accumulated; and it had been the common opinion that the country was a large user of capital supplied by lending countries, like England and France, for the financing of its trade and industry. Hence there was no little wonderment that so huge a sum as the first war loan should have been almost instantly absorbed. The question was at once suggested whether the flotation of the loan had not really been accomplished in large part through the use of bank credit, instead of through contributions of privately owned free capital; and whether it would not ultimately be found that the loan was taking the form of large issues of virtually irredeemable bank notes. This question cannot yet be answered; but an interesting classified analysis of the subscriptions to the loan has recently been published by the "Frankfurter Zeitung," from which it appears that from one point of view,—i. e. that of the large number of small subscribers,—the loan was a genuinely popular one; and yet that from another point of view,—i. e. that of the high proportion of the total amount which was taken in very large sums by an extremely limited number of subscribers,—the success of the issue must have been due to heavy subscriptions from banks, with possibly some insurance companies (though these companies in Germany have most of their resources locked up in mortgages), some great industrial concerns (Krupps taking 30,000,000 marks), and scattered individuals of great wealth. The provinces of Westphalia and Silesia are reported to have taken 40,000,000 marks, which may have been accumulated funds of their workingmen's insurance institutions, or simply balances on hand. It is improbable that the German savings banks can have been large subscribers, for they, like the insurance companies, have long shown a strong predilection for investments in mortgages, and moreover have been subjected to a severe strain from deposit withdrawals for at least two years past. The tabulated figures of the "Frankfurter Zeitung" for this first German war loan fail to clear up many of these obscurities, but it is possible that similar statistics for the second German war loan of about the same amount, just announced as in contemplation, will, when compared with these figures, prove illuminating. The present figures are as follows [mark equals 23.8 cents]:

CLASSIFICATION OF FIRST GERMAN WAR LOAN SUBSCRIPTIONS.

Amount of Bonds Subscribed for (Marks).	Number of Subscribers.	Aggregate Am't of Subscriptions (Marks).
100 to 200	231,112	36,101,400
300 to 500	241,804	110,700,700
600 to 2,000	453,143	586,946,300
2,100 to 5,000	157,591	579,403,600
5,100 to 10,000	56,438	450,148,500
10,100 to 20,000	19,313	307,186,600
20,100 to 50,000	11,584	410,458
50,100 to 100,000	3,629	315,046,200
100,100 to 500,000	2,050	508,548,400
500,000 to 1,000,000	361	287,196,700
Over 1,000,000	210	868,937,000
	1,177,235	4,460,701,400

* * *

The Bonded Indebtedness of the Philippines.—The bonded indebtedness of the Philippine government, including the indebtedness of the cities of Manila and Cebu, as shown in the annual report of the Chief of the Bureau of Insular Affairs, amounts to $16,125,066, the items being as follows:

Land purchase bonds, 4 per cent $7,000,000, redeemable 1914, due 1934.

Public works and improvement bonds, 4 per cent, $2,500,000, redeemable 1915, due 1935.

Public works and improvement bonds, 4 per cent, $1,000,000; redeemable 1916, due 1936.

Public works and improvement bonds, 4 per cent, $1,500,000; redeemable 1919, due 1939.

City of Manila sewer and water works bonds, 4 per cent, $1,000,000; redeemable 1915, due 1935.

City of Manila, sewer and water works bonds, 4 per cent, $2,000,000; redeemable 1917, due 1937.

City of Manila sewer and water works bonds, 4 per cent, $1,000,000; redeemable 1918, due 1938.

City of Cebu sewer and water works bonds, 4 per cent, $125,000; redeemable 1921, due 1941.

The sinking fund provided by law for the retirement of the bonds is ample and the status of the bonds is eminently satisfactory.

During the six months referred to, bonds of the Manila Railroad, to the face value of $774,000, and the bonds of the Philippine Railway, to the value of $8,000, were issued against completed construction. These, under the terms of the concessionary grants, are guaranteed as to interest payments by the Philippine Government. To December 31, 1913, bonds so guaranteed as to interest were outstanding as follows: Manila Railroad Company, $7,085,000; Philippine Railway Company, $8,551,000.

* * *

Street Railways in Germany.—Of the 288 companies operating street railways in Germany on March 31, 1913, with a total mileage of 3,116 miles, 155 were operated and owned by private companies and 133 were operated under public ownership. The mileage was distributed in the Empire as follows: Rhine Province, 783 miles; Province of Westphalia, 332 miles; Province of Brandenburg (including Berlin), 274 miles; Saxony, 234 miles; Bavaria, 166 miles; Alsace-Lorraine, 85 miles; Grand Duchy of Baden, 81 miles; distributed through other parts of the Empire, 1,161. Of the 2,221 miles of railways in Prussia, 1,113 miles were broad gauge and 1,108 were narrow gauge.

Electric railways have been slowly displacing the other systems. While in 1901 there were 101 miles of horse-car lines, in 1912 this had decreased to 24 miles. In 1901 there was 83 miles of steam-driven cars and in 1912 only 44 miles.

The following table gives the total equipment of the street railways in Germany in 1911 and 1912:

	1911.	1912.
Steam locomotives	65	67
Electric locomotives	46	48
Benzol cars	3	..
Electric cars with motors	11,884	12,545
Electric trailers	20,723	22,083
Baggage cars	84	85
Freight cars	887	931
Postal cars	33	34
Special cars	1,361	1,412
	35,186	37,205

Of the 50,982 employes on the pay rolls of the street railway companies in Germany, 14,865 are employed in Berlin.

In 1912, 2,761,756,355 passengers were transported on the German street car lines, as against 2,567,155,295 in the preceding year. In the freight service 1,862,609 metric tons were carried in 1912, as against 1,794,585 in 1911.

The total receipts of all the German street railways in 1912 were $67,392,785, as against $62,051,956 in 1911. Almost the total of these amounts—$64,798,603 in 1912 and $60,094,762 in 1911—were receipts from passenger traffic, and the small balance was freight and postal traffic receipts.

Total expenditures in 1912 aggregated $42,957,076, as against $38,908,716 the preceding year. The figures of invested capital are placed at $287,593,726.

In the 1912 statistics 244 deaths and 1,100 injuries to passengers and private individuals are noted, not inclusive of 8 deaths and 120 injuries to employes.

Very little progress has been made in Germany in the electrification of steam railroads. A short stretch from Berlin to Marienfelde was electrified several years ago, but no developments of importance along these lines have recently been made.

* * *

Platinum Production in the United States in 1913.—Although the high price of platinum encouraged prospecting in the United States in 1913, the expected increase in the production of crude metal was not realized. The total production from California and Oregon, the two sources of platinum ore in this country, amounted to 482.87 crude ounces and was valued at $18,477.

A considerable output of platinum is also obtained in the United States from the refining of gold and copper bullion. A portion of this platinum originates in old scrap, sweepings, etc., sold by jewelers and dentists. About 650 fine ounces, however, was derived in 1913 as new metal from gold and copper bullion from domestic mines. The production of refined platinum in this country in 1913 from domestic soures was 1,034 troy ounces valued at $46,530, against 1,005 troy ounces valued at $45,778 in 1912.

Russia has been the greatest producer of platinum in the world, the output of crude platinum in 1913 being 250,000 troy ounces.

The value of platinum imported for consumption in the United States in 1913 was valued at $5,040,210, against $4,503,682 in 1912.

In late years platinum has come into greater use in the jewelry trade, but this increased demand has been compensated for by the decreased use of the metal for electric light bulbs.

The Population of Russia and Its Eastward Trend.—There appeared in THE MARKET WORLD AND CHRONICLE for October 17 some discussion of the intensely interesting possibilities with regard to the expansion of Russian trade, and the development of her vast internal resources. The London "Statist" in a recent issue advances a suggestion which is not unworthy of consideration in connection with the widespread forebodings throughout Western Europe as to the tendencies toward expansion Westward supposedly inherent in Russian conditions.

"After making a heavy allowance for virtually uninhabitable regions," says the "Statist," "an aggregate of about 170,000,000 inhabitants in respect of 8,600,000 square miles indicates a very small density of population. It is, however, to be recollected that Russia is a country where the population rapidly increases. Every man who has attained the age of over twenty-three or twenty-four and is unmarried is rather looked askance at. It is usual for Russians to marry early, and in the great majority of cases early marriages result in large families. Thus Russia has the highest birth-rate in the world, and though the death-rate is also very high, still the surplus of births over deaths is very great. The birth and death rates in Russia, in comparison with the figures for the United Kingdom, Germany and France are shown below:

	Average for Decade 1900-09.	
	Birth-Rate.	Death-Rate.
Russia	46.1	29.4
Germany	34.1	19.8
United Kingdom	28.1	16.0
France	19.7	19.6

"The rapidity of the growth of population of Russia is counterbalanced by the extraordinarily large area that remains to be settled in the East as well as in European Russia itself. The idea of a disposition on the part of Russia to extend westward, where there is a far more dense population than even in the most populous portions of Western Russia, is an altogether erroneous one. There is an enormous area to the east of Canadian-like character that remains to be populated."

INSURANCE

Articles on the Theory, Practice, and Experience of Insurance.

Notes on Insurance, American and Foreign.

Items of Insurance News.

INSURANCE, as it appears to the world at large and to the immense majority of those engaged in it, is a business, pure and simple. It is a beneficent form of business and its subject matter is the alleviation of human ills, the protection of mankind against the worst of the consequences of the inescapable accidents and losses of our human lot, and the provision of means whereby the continuity and effectiveness of individual, social and economic life may be maintained despite these accidents and losses. The basis upon which its structure is erected, moreover,—its law of probability, its expectancy, its rule of "average," its "experience,"—are conceptions essentially philosophic or semi-philosophic in their character. They have not been discovered in a purely empirical way and reliance upon their substantiality is not mere confidence that the ground which has been tested by throwing the weight on it will continue to hold. From the very beginning of insurance it has been commonly supposed that it is "speculative"; in its earlier days it was confounded with pure gambling. The generality of men have until recently been unable to comprehend that undertakings running far into the future and having no other warrant than some intangible "law" or "rule," could properly be classed among the solid and conservative business activities. Society first became reconciled to the manifest advantageous results of insurance, which seemed in some incomprehensible way to continue to be realized; acceptance of the asserted principles of insurance, as worthy of honorable regard, was belated and long insecure. Within the memory of persons still living, the common thought about insurance was that if certain *soi-disant* insurers or underwriters were willing to lay bets at very long odds that certain obviously possible events of a nature harmful to individuals would not occur, it was well enough for the individuals to take the bets. Even to-day there is a tinge of this thinking in not a few minds. It has perhaps almost ceased in connection with life insurance; but not all, even among the thinking, can dismiss from their minds the association of the various forms of loss insurance with pure hazard, or chance, which taken as the basis of a business makes it essentially gambling. In short, it is not unusual to find that even persons directly engaged with insurance are open to the Platonic reproach that "they are ignorant of philosophy." To these persons the best that can be said of insurance is that it is an established and respectable business and that there the matter had best be allowed to rest.

On the other hand, it may fairly be said that the philosophers have been almost equally ignorant about insurance. As a class, they appear to have been remarkably slow in discovering that insurance is philosophy, and should have its place in their thinking. Even the pragmatists among them have hitherto paid scant attention to insurance and have rarely shown interest in its theoretic implications, on the one side, or in its practical applications, on the other. The teachers of theoretic ethics have almost entirely neglected it; and we have ourselves heard an eminent professor of ethics speak of life insurance as an illusory scheme for making the uninformed undertake a wasteful method of saving. In this field, the rough and ready life insurance agent, with all his faults, has taught better ethics than the professors.

The suggestion of what has just been written has come from a little book containing an address delivered some two months since by a teacher of philosophy and, in the opinion of many, an excellent philosopher himself, Professor Josiah Royce, of Harvard University. The title of the book is "War and Insurance" [New York: The Macmillan Company], and the theme is the philosophically justified possibility of employing insurance as an instrumentality for associating the nations of the earth in a communal enterprise, mutual insurance, whose operation must perpetually tend to mitigate antagonisms, to incite to common and disinterested endeavor, and to subordinate the natural (and philosophically inevitable and justifiable) impulses of pure self-interest and self-assertion in nations, one towards the other, to the impulses making for the achievement of a good which is both of self-interest and of common or universal interest. These latter impulses are just as natural, inevitable and justifiable, according to the Kantian philosophic principle which Professor Royce makes his point of departure, as are the impulses of self-interest and self-assertion, but they have the immense advantage that they make for peace and not for war among the nations that are governed by them.

Space fails to describe the vast programme of international mutual insurance which Professor Royce outlines. It must be admitted of it that in its strangeness it appears at a first reading almost as phantasmagoric as one of Mr. H. G. Wells' weird imaginings of a world transmogrified by the employment to their uttermost theoretic capability of the latest inventions of man and of the most recently discovered forces of nature. The practical man will assuredly say of Professor Royce's international insurance scheme, if he can bring himself to read it through, that it is utterly impracticable. And if the practical man were always proved right by the event, this would end the matter. But it does no harm for practical men engaged in the business of insurance to know that, outside his own circle, there are those who are putting his familiar material to unfamiliar uses which conceivably may occupy largely the thoughts of men and which not to know may argue himself unknown.

At any rate, it is worth the while of any one whose business is insurance to ponder passages like the following in Professor Royce's little book: "We cannot predict all that it [insurance] will yet accomplish; but we can already see that of all the business relations and of all the practical communities yet devised, the insurance relations and the insurance communities most tend to bring peace on earth, and to aid us towards the community of mankind."

THE SAFETY PROBLEM OF THE RAILROADS AND THE VALUE OF COMPREHENSIVE STATISTICS IN SAFETY WORK

By R. H. Newbern
Superintendent, Insurance Department, Pennsylvania R. R. Co.

WHEN the Pennsylvania Railroad began a systematic effort to reduce accidental injuries to its employes in 1910, one of the problems was to develop an accurate system of personal injury accident statistics. The first step was to devise an accident report which would clearly show the primary cause of the accident and other information as to whether any rules were violated, who was responsible, what discipline was imposed, what guards, precautions or instructions would have prevented the accident and what action was taken. A form of report was finally adopted in 1911 containing 29 items of information and is now standard on the Pennsylvania Railroad and all its affiliated lines.

On the Pennsylvania System employing over 225,000 men and carrying over 185,000,000 passengers and with a freight movement exceeding 385,000,000 tons annually, there are 60,000 reports of accidents to employes and 10,000 reports of injuries to passengers and others forwarded to the Insurance Department. In order to simplify the handling of this large number of reports, the "Hollerith" system was adopted and a code prepared showing causes, nature of injuries, occupations, locations, days disability and other items of information necessary in the analysis of accidents. As the reports are received they are codified, each item of information being marked with its designated code number and a permanent record of the accident is transferred to a card by means of a punching machine, and when statements or data are needed for the information of the executives or operating department or for the guidance of the safety organization, the cards are sorted by means of machines and the desired information obtained quickly, accurately and economically.

For statistical purposes employes are separated into two classes, one, employes in the maintenance of equipment, commonly known as shopmen, and the other, all other employes such as trainmen, M. W. men, station men, etc., designated as road and yard men.

The statistics provide for the following information:

NUMBER KILLED AND INJURED BY

Detailed causes.
Nature of injury by cause and occupation.
Length of disability.
Occupations.
Length of service.
Time of day or night.
Weather conditions.
Divisions.
Grand divisions.
Shops.
Large stations and yards.

The statistics are compiled on the same basis for shop and road and yard accidents, excepting as to detailed causes, there being 360 shop causes and 340 road and yard causes, making 700 separate causes of accidents. The causes in turn are classified under 36 general headings, which indicate the nature of the work at time of accident. These general headings are as follows:

SHOP.

Operation of machines and working of material.
Repairing locomotives.
Repairing cars.
Handling and use of hand tools.
Handling and use of jacks.
Handling material.
Trucking material.
Tools and material falling.
Working around turntables, coal docks, ash pits.
Operation of cranes, hoists and other devices.
Obstruction and material in aisles, passages and footways.
Defective floors and footways.
Erection of scaffolds and working on same.
Ladders.
Electrical.
Handling ice.
Getting on or off engines or cars at rest.
Getting on or off engines or cars in motion.
Causes not otherwise classified.

ROAD AND YARD.

Getting on or off engines or cars at rest.
Getting on or off engines or cars in motion.
Setting and releasing hand brakes.
Coupling and uncoupling cars or engines.
Connecting and disconnecting steam and air hose, including operating angle cock.
Accidents on or around locomotives
Operating switches
Handling baggage and mail and baggage trucks.
Falling in ash, turntable and inspection pits.
Slipping or tripping on coal wharves, platforms, walks and bridges.
Working on or around engines, cars or trains.
Crossing or walking in yards or on tracks or bridges to and from work.
Insufficient clearances.
Obstructions around tracks and in yards.
Loading, unloading and handling freight, etc., at freight and transfer stations.
Working on or around tracks and buildings—including loading and unloading.
Causes not otherwise classified.

By comparing the number of accidents under each general heading we ascertain what kind of work is the most hazardous and the specific cause under which the accidents are reported. The primary cause of every accident is indicated. The records are kept by divisions, shops, stations and yards and it is, therefore, easily seen at what points any particular kind of accident is most frequent.

There is included in the statistics additional information bearing an important relationship to accident frequency, such as the average age of employes, length of service, etc. Regarding the length of service, it was found that during the year 1913 there were 90,000 new men employed, although the total increase in the number of employes for the year was less than 9,000, the greater number of transient employes being in the maintenance of way department. The statistics developed the fact that during the year 25 per cent of the men killed and injured had less than six months' experience and that 28 men were killed and 2,391 injured who had been in the service less than thirty days. Assuming a similar experience on all the other railroads of the United States, at least 360 men were killed and 15,000 injured last year having less than one month's experience, and many met death during their first week's work,—not because they were careless or foolhardly, but because they were ignorant of the hazards of the work. It is recognized that the education of employes is one of the most important features in safety work, but the large number of transient men makes this educational feature a difficult problem. Experience also indicates that a greater effort should be made to instruct the new man as to the hazards of his occupation before he is permitted to be placed in a hazardous position.

A business employing men in more than 100 occupations will be unable effectively to teach the doctrine of safety unless some means are provided to discover the number of injuries sustained by men in each specific occupation. The statistics, therefore, are so arranged that the number of injuries and fatalities can be shown in each department and in each occupation of the various departments, also the reports are tabulated to show the specific cause in each occupation. This information will of itself suggest definite instructions along safety lines.

The number of accidents occurring during each hour of the day or night is shown as the time of the accidents suggests various preventives, such as improved lighting facilities and rearrangement of working hours.

A statement of so many men injured on railroads during a certain period does not convey a proper meaning; it is the loss of time

that shows what the employe really suffers. Therefore, the statistics provide for the number killed, the number injured, the number of indefinite injuries and the actual number of days lost. Our statistics include all accidents resulting in a disability of one day and over. It was found that 18 per cent of all the injuries involved less than four days' disability, and the number of "fifteen days or over" accidents (the minimum period covered by liability laws) amounted to 50 per cent of the total days' disability.

Our statistics also show the nature of the injury; this information embodies 141 different kind of injuries included under the following general hearings:

Amputation.	Fractures.
Eye injury.	Electrical shocks.
Sprains and strains.	Burns.
Bruises.	Dislocations.
Incised wound or laceration.	Injuries not included above.

This information enables the management to study methods of treatment to reduce the length of disability. Take the subject of fractures, for example: There were 758 cases last year resulting in 19,190 days of disablement, 87 indefinite disability cases and 53 fatalities. The medical profession recognizes the necessity for the best treatment of these injuries, as fractures may result in extended disablement on account of improper treatment.

The value of accident statistics depends largely upon the remedial action they suggest, and the Safety Inspectors by analyzing these statistics become familiar with all the hazards of operation and such knowledge has been found invaluable in inspection work.

Statistics also form an important feature in the operation of a safety organization, based on the theory that what has happened is a reliable indication of what will happen. They are also valuable on the educational side of the question, as they show each man the causes responsible for accidents in his particular line of employment, and it is the practice to attach to all inspection reports, statistics of all accidents occurring at the points covered by the inspection.

Our experience clearly indicates that comprehensive accident statistics furnish a most effective means of suggesting remedial measures in accident prevention work.

THE INVESTMENTS OF LIFE ASSURANCE COMPANIES

By P. C. Crump, F. I. A.*

FOR a considerable number of years the subject of investments received comparatively little attention from the members of our profession—a rather astonishing thing, bearing in mind the enormous effect it has on everything concerned with the business of insurance. Latterly, however, quite a number of articles and papers have been written by those well qualified to deal with the matter, and I am afraid, therefore, that it becomes rather difficult at the present time to say anything new or present any fresh facts of an interesting and instructive nature. Notwithstanding this, I trust that the few remarks I have to make to-night may not be without interest, and will lead to a discussion both useful and beneficial to us all.

I should like first of all to draw attention to the question of profit in connection with life assurance business and how it is earned, although, of course, most of you are familiar with the sources from which it is obtained. In the first place there is the surplus from favorable mortality—that is to say, the experience of a lighter death rate at the various ages than is provided for by the table on which the annual or quinquennial valuation is made; secondly, there is the interest earned in excess of that expected and used in the necessary calculations; thirdly, the loading of the pure or theoretical premiums in excess of what is actually required for office expenses; and fourthly, miscellaneous sources, such as the profits from surrenders, lapses, fines, etc. In the case of an office under anything like normal management, therefore, it is obvious that a certain amount of so-called profit will automatically be disclosed, as something more than the prime cost of assurance is being charged. As regards the third and fourth of these sources, it is, of course, impossible to say very much, as so much will depend on the class of business written and the rate of premiums in force, but various tests are possible in the case of the first two items. It is customary, and indeed imperative, for companies to investigate and publish their experience as regards both mortality and interest, and it is open to practically any one to form some idea of the position of an office from these returns. We frequently read in the reports submitted that the actual mortality experienced was, say, 75 per cent of that expected and provided for, and that the interest earned was, say £4 per cent, free of tax, as against 3 per cent used in the valuation. It is at once apparent from this that a considerable surplus is being obtained from these sources, but on the other hand it is not by any means evident what is the exact effect the published figures may have on the bonus declarations. When a claim arises under a policy, the amount of loss is represented by the difference between the sum assured and the reserve held to meet this liability; this difference is known as the "death strain." In ascertaining the profit from mortality a comparison is made, not between the actual claims and the expected claims, but between the actual and expected death-strain, the last expression being the difference between the sums assured and the corresponding reserves multiplied by the various death rates applicable to each age.

Now as to the relative effect of these two sources of profit (i. e. mortality and interest) on the bonus declaration, this will depend on a variety of conditions. As regards mortality, it may be said generally that a young office will derive a greater proportionate advantage from light rates than an older office, as the policies will, on the average, have been a shorter time in force, and there is more scope for such a profit to accrue. On the other hand, a long established office, with a greater percentage of old policies on its books carrying large reserves, stands to gain more from the high interest rates earned by such large reserves. Another point to be considered in this connection is the preponderance of any one class of business over another; thus endowment assurance policies naturally require greater reserve values than whole life policies, and an office making a special feature of this class of assurance will obviously depend more on its interest profit than its mortality profit for providing bonuses. As a matter of fact, in the first few years of the policy's existence, the latter may be very considerable owing to the superior class of lives who, on the average, take out this type of policy, but the effect rapidly dies away. Whole life policies, however, afford scope for making substantial mortality profits throughout practically their whole existence.

Returning to the question of loading for the expenses, it is, of course, common knowledge that the expenses are exceptionally heavy during the first year, and as the premium is a level one (or nearly always so) it is necessary for the assured person to live some years before any profit can possibly accrue to the company from loading.

The system of bonus distribution also has some bearing on the

*A paper read before the Insurance Institute of Sheffield. It should be borne in mind that some months have elapsed since this address was delivered, and that the advent of the war in Europe has materially altered the actual financial situation, although the fundamental value of the article is unimpaired.

question. If a company adopts the plan of declaring and paying a cash bonus to its policyholders, neither its funds nor the reserves held will increase to so great an extent as if the bonus were attached to the sum assured, and the advantages of a larger interest yield will not be so marked.

I have already drawn attention to the great effect which the rate of interest has on the bonus of endowment assurances, and as this class of business has so enormously increased in recent times, the proportion of new policies being in the ratio of about ten to every one whole life policy, it will perhaps be useful to illustrate by an example the effect produced. I have not thought it necessary to go into any fresh calculations, but have adopted the figures as set out by Mr. James Chatham in his well-known paper entitled an "Analysis of the Profit from Endowment Assurances," contributed to the Transactions of the Faculty of Actuaries, Volume 3. Mr. Chatham here proceeds, given certain assumptions, to analyze the surplus in order to show the extent to which the various sources of profit contribute to the bonus, and thus ascertains what produces the increase. The assumptions he made were as follows:

The example taken was that of a man aged thirty years insuring for a period of twenty-five years; this age and term were used because they agreed approximately with the average obtained by an office doing a considerable proportion of endowment assurance business. For the same reason the premium used was £4 0s. 7d. per cent. The expenses were assumed to be 66⅔ per cent of the first premium and 6⅔ per cent of the subsequent ones, a basis which closely coincides with actual conditions. The rate of interest employed was 3¾ per cent, thus corresponding closely to the average yield obtained at that time by British companies, which was £3 15s. 8d. per cent (free of tax, of course). The valuation rate, however, was 3 per cent, thus allowing for a margin of ¾ per cent. The mortality was assessed as 80 per cent of the O[M] Table, which approximates fairly closely to that experienced by many first-class companies and also gives effect to the medical examination undergone when the proposal is filled in. Claims were assumed to be paid two months after the date of death, and, to provide for bonus to those who died during the inter-valuation periods, an interim rate of 27s. 6d. per cent was adopted, this also being an average of the amount allowed in practice.

It can thus be definitely said that all assumptions were eminently practical. Let us now consider the results brought out in this typical case, first on the supposition of a cash bonus. These will be best explained by means of a table:

TABLE A.—QUINQUENNIUM.

	1st.			2nd.			3rd.			4th.			5th.	
	s.	d.	£	s.	d.	£	s.	d.	£	s.	d.	£	s.	d.
Mortality	4	3		2	3		1	9		1	8			5
Interest	1	4		4	6		8	3		12	10		18	7
Loading	1	9		13	4		13	5		13	6		13	8
	7	4	1	0	1	1	3	5	1	8	0	1	12	8
Less interim bonus					7			9		1	0		1	3
	7	4		19	6	1	2	8	1	7	0	1	11	5

These figures are decidedly interesting, and give us a very good idea of the various sources from which profit is obtained, and the relative amounts attributable to such sources.

It will be noticed that the mortality surplus nearly all occurs in the first few years, as would be expected, and is practically nil towards maturity. The expenses swallow up all the loading in the first quinquennium and then remain constant. The interest, however, with which we are chiefly concerned to-night, exhibits a steady and appreciable increase as long as the policy remains in force, and, if a greater period than twenty-five years had been taken for our example, this feature would have been even more marked. If the foregoing amounts are translated into their equivalent reversionary bonuses we have:

TABLE B.—QUINQUENNIUM.

	1st.			2nd.			3rd.			4th.			5th.	
	s.	d.	£	s.	d.	£	s.	d.	£	s.	d.	£	s.	d.
Mortality	7	4		3	4		2	4		1	11			5
Interest	2	3		6	9		10	10		14	10		18	7
Loading	3	0	1	0	0		17	8		15	7		13	8
	12	7	1	10	1	1	10	10	1	12	4	1	12	8
Less interim bonus					11		1	0		1	2		1	3
	12	7	1	9	2	1	9	10	1	11	2	1	11	5

The difference in the figures is, of course, due to the fact that the various amounts are left with the office to accumulate instead of being paid out in cash to the person entitled. The early figures are thus much more largely increased in proportion than the later ones, while those for the fifth quinquennium are unaltered.

From this second table it will be seen that out of a total reversionary bonus of £6 14s. 2d. × 5 = £33 10s. 10d., or £34 12s. 6d. if we neglect the interim payments, no less than £13 16s. 8d. is due to interest, as compared with only £3 16s. 8d. from mortality.

During the last five or six years, however, there has been a very decided tendency for the rates of interest obtained by most companies on their investments to increase, and if a yield of 4 per cent instead of 3¾ per cent be used in the calculations, the figures will be:

TABLE C.—QUINQUENNIUM.

	1st.			2nd.			3rd.			4th.			5th.	
	s.	d.	£	s.	d.	£	s.	d.	£	s.	d.	£	s.	d.
Mortality	7	4		3	4		2	4		1	11			5
Interest	3	0		9	0		14	9	1	0	3	1	5	7
Loading	3	0	1	0	0		17	8		15	7		13	8
	13	4	1	12	4	1	14	9	1	17	9	1	19	8
Less interim bonus					11		1	0		1	2		1	3
	13	4	1	11	5	1	13	9	1	16	7	1	18	5

These results demonstrate even more clearly the enormous value of a high interest rate, the amount of bonus from this source now being £18 2s. 11d., as against £3 16s. 8d. from mortality. In other words, an increase of ¼ per cent in the interest yield, from 3¾ per cent to 4 per cent, will produce under the given conditions a total extra bonus of £4 16s. 8d., the equivalent increase in the annual rate being nearly 4s. per cent from this source alone. Furthermore, dealing with the last quinquennium only, the excess interest due to the extra ¼ per cent earned has the effect of increasing the bonus earned for that period by nearly 25 per cent.

I think I have said enough to show the extreme importance of the rate of interest earned by a life office on its funds, and now intend to make a few remarks on investments generally.

It was in the year 1896 that the prices of Stock Exchange securities attained to the highest level yet reached; since that date there has been, with a few slight intermittent breaks, a continuous decline in values. So drastic has this fall been that investors have come to look upon the rate of interest yielded in an entirely different light than hitherto, and to expect a return on their money from high-class securities equal to that which, but a short time ago, could only have been obtained from quite speculative sources. There have been signs recently that the low water mark has been reached, but it is reasonable to assume that it will be a very long time, if ever, before quotations regain their former level. Perhaps it would not be out of place to make a few comparisons in what are known as the Trustee groups.

In 1896 Consols touched 113⅞, while in July of this year (1913) business was marked at 72⅛, a fall equivalent to 37 per cent. Of course, at the former date the dividend was at the rate of 2¾ per

cent, as against 2½ per cent now, but this reduction had been decided on many years previously and would account therefore for only about 2 points. The best home railway debenture stocks fell in the same period by about 40 per cent on the average; preference stocks by 40 per cent; Colonial Government 3½ per cent stocks by about 20 per cent; British municipal securities by percentages ranging from about 20 to 40. Furthermore, it must be remembered that the two latter classes of security are for the most part definitely redeemable at par by certain fixed dates, otherwise it is reasonable to assume the loss to holders would have been even greater.

Some idea of the enormous depreciation which has taken place in recent times can be obtained from a study of the Stock Exchange values which are published each month in the "Bankers' Magazine" in respect of 387 representative securities taken from all classes of investments. In January, 1907, when the present list was decided upon, the market value of these securities was £3,843,000,000, a figure which had shrunk to £3,435,506,000 by September 21 of this year (1913). The fall of £394,494,000 thus recorded represents a fall in the period named of actually more than 10 per cent, or about 1½ per cent per annum. Thus on the basis of an average rate of, say, 4½ per cent, no less than one-third of the entire interest yield was swallowed up in depreciation of the capital value. Now dealing with the present year (1913) alone, of which less than nine months had elapsed at the date of valuation, the shrinkage approximated to £104,000,000—that is, about 3 per cent, or an equivalent of 4 per cent for the year. Such a fall, of course, is the equivalent of saying that on the average most large investors will have received practically no interest at all on their funds during 1913, unless some recovery in market conditions takes place before the end of the year.

Insurance companies have naturally felt these reductions in the market quotations very severely, as in the older days the gilt-edged group was the one in which the major portion of their funds was invested, and drastic writings down of ledger values have had to be resorted to. It may be argued that with the fall in prices there has existed an excellent opportunity of making cheap purchases; but unfortunately, as I have just indicated, trustee securities were already so largely held that most offices have preferred to find fresh fields of investment for their rapidly increasing funds. Of course, other sections of the investment market have suffered, too, but not in so marked a degree. Undoubtedly, however, these times of low prices have enabled many institutions to invest their surplus money in an extremely remunerative way, and the result is to be seen in the long list of offices which, for some years past, have regularly improved the interest yield on their total assurance funds. In this connection, however, it is to be noted that those companies whose business is rapidly extending and whose assets are increasing proportionately have enjoyed a very distinct advantage over those whose funds increase but slowly. High rates of interest are of but little use to people with no money to invest, whilst those who have some are able to recoup themselves to a certain extent for the losses sustained on previous investments. Again, it is not entirely a matter of augmentation of funds, for there is also the question of finding an outlet for maturing investments: this item, in certain cases, is very considerable (loans on rates repayable on the instalment plan is an example of this), and particularly is this so where a company has a large amount of mortgages which are either being repaid or can be called in. It is not usual to treat mortgages as being subject to depreciation in value, but as a matter of fact they do so depreciate, especially where there are restrictive covenants as to the number of years which must elapse before repayment can be insisted upon. A mortgage bearing, say, 3½ per cent interest at a time when an advance on similar security would only be made at 4 or 4½ per cent, has undoubtedly fallen in value if it is impossible to secure an increase in the rate earned. It is true that the depreciation does not have to be publicly disclosed, but except for that fact the position is very similar to that of a Stock Exchange security which is redeemable at par on a fixed date.

The question of the relationship existing between market values and ledger values has naturally always been an important one, but added weight has recently been given to it by reason of the passing of the Assurance Companies Act, 1909, the third schedule of which consists of a form of balance sheet to be used in accordance with the instructions set out in Section 4 of the Act. Attached to this balance sheet are four notes, the third of which is as follows:

The Balance Sheet must state how the values of the Stock Exchange securities are arrived at, and a certificate must be appended, signed by the same persons as sign the Balance Sheet, to the effect that in their belief the assets set forth in the Balance Sheet are in the aggregate fully of the value stated therein, less any investment reserve fund taken into account. In the case of a company transacting life assurance business or bond investment business, this certificate is to be given on the occasions only when a statement respecting valuation under the Fourth Schedule is made.

It is to be noticed that the word "assets" is used, which includes, of course, reversions, house property, ground rents, and so on, and does not merely refer to Stock Exchange securities which have a definite and ascertainable market value. No doubt opinions may differ as to the manner of arriving at the true value of some of these miscellaneous groups, but it is quite evident that they cannot be ignored in view of the depreciation which has been going on in all forms of property. The requirements very rightly refer to the state of securities in the aggregate, and any reserve fund held may also be taken into account. The effect of these two conditions is to render unnecessary constant alterations in the books as the market quotations vary from time to time. Lastly, this certificate need only be given on occasions when a statement respecting valuation under the Fourth Schedule is made; this is in accordance with Section 5, which states that every assurance company shall, once in every five years, or at such shorter intervals as may be prescribed by the instrument constituting the company, or by its regulations or by-laws, cause an investigation to be made into its financial condition, including a valuation of its liabilities, by an actuary, and shall cause an abstract of the report of such actuary to be made in the necessary form. It will be seen that an office which makes an annual valuation is required to give this certificate as at the end of each financial year, whereas an office making a quinquennial valuation need only do so once in five years. A much greater strain, therefore, may be thrown upon the former class of office in order to preserve its solvency in accordance with the conditions of the Act, but on the other hand the with-profit policyholder is naturally kept in much closer touch with the actual financial position of the company in which he is insured. The system of quinquennial valuations, however, may be said to have a tendency towards stability of the bonus declarations. I should like to point out, in this connection, that up to the present most companies have given this certificate each year, despite the fact that they make quinquennial valuations and that it is not absolutely necessary, therefore, to do so.

At first sight, it might be supposed that the vast sums used for writing down securities in the last decade would be enough to cripple most institutions, and prevent the declaration of any bonus at all. As a matter of fact, as most of you are probably aware, there have been a few cases recently where such a result has been found inevitable, but, on a subsequent valuation being made, surpluses were once more available to enable the directors to resume

paying a substantial rate of bonus. Further, it has been recognized that the financial position was thereby strengthened, and after a short lapse new business returned to normal dimensions. This year (1913) we have seen two more companies finding it necessary to pass the bonus to their with-profit policyholders owing to the depreciation which had occurred in their holding of Stock Exchange securities, but there seems no valid reason why such a course should materially affect their future progress. Of course, the existing policyholders suffered a certain amount of loss, but the present status of such companies is all the stronger for the steps taken.

I have already referred to the improved yields obtained by insurance companies in recent years, and to the fact that it has been brought about to some extent by the fall which has taken place in the quotations of marketable securities. This is by no means the only cause, however, and I propose therefore to go into this subject in somewhat more detail. A well-known authority has said, "Make a point of looking well to the realized rate of interest, and the bonuses will look after themselves," and it would seem, judging from results, that this maxim has been assiduously followed by those responsible for the administration of the funds.

How has this object been attained? First and foremost, by the adoption of a wider field for investment purposes. In the old days the available securities were strictly limited, the only two classes, practically, being British Government Securities and Mortgages. This state of affairs did not, of course, last for long, but for a considerable time subsequently most of the investments were made in the stocks of Colonial Governments and Home Railways. This fact can perhaps be best illustrated by comparing the percentages which some of the main groups bore to the total funds at different dates. In 1857, mortgages formed no less than 66 per cent of the total, British Government securities 16 per cent and debentures 8 per cent. In 1870, mortgages still comprised nearly half the assets, the percentage being 47, that for British Government securities being 8 per cent, loans on rates 9 per cent, and debentures 9 per cent. Foreign Government securities at this date were only 1 per cent.

By the year 1890, however, considerable changes had to be noted. Mortgages had sunk to 41 per cent, but the actual amount so invested had nevertheless appreciably increased. Loans on rates had advanced to 10 per cent, debentures to nearly 11 per cent, whilst miscellaneous shares and stocks had risen from less than 3 per cent to over 6 per cent. Property and ground rents had also come largely into favor, the percentage being about 6½, as against 4½, while Foreign Government securities were still less than 2 per cent. Now as to the position in the year 1900, mortgages were down to 29 per cent, and loans on rates to less than 9 per cent. Indian and Colonial Government securities were about constant at 7 per cent, but Foreign Government securities had improved to 3½ per cent, and property to 8 per cent. The two greatest changes, however, were those of debentures, which had risen from 11 to 17 per cent, and stocks and shares, which had nearly doubled to 12 per cent.

For the next five years, viz., to 1905, none of these percentages varied very much, but in the subsequent period to 1911, which brings us as near to the present time as the Board of Trade returns will allow, further important changes took place, as will be seen from the following table:

TABLE D.

	1857.	1870.	1890.	1900.	1911.
Mortgages	66	47	41	29	22
Loans on rates		9	10	9	6½
British Government	16	8	3	2	1
Indian and Colonial Government		5	6	7	8
Foreign Government		1	2	3½	6½
Debentures	8	9	11	17	24
Stocks and shares		3	6½	12	13
Property and ground rents		4½	6½	8	9

In examining all the foregoing figures, one cannot help being struck by the almost continual reduction in the percentage invested in mortgages, which originally formed two-thirds of the total and now only comprise about a fifth part. In fact, the amount advanced has remained practically stationary for some time, and two or three years ago the figures were overtaken by those of another group for the first time. Loans on rates attained to their greatest proportion in 1879, viz., 14 per cent, gradually fell to 9 per cent, and fluctuated but little from that figure until the year 1906. Since that date, however, there has been a steady fall to 6½ per cent, which is no doubt due to the comparatively low rate of interest yielded. As a matter of fact, municipalities have had to submit to an appreciable rise in the interest charged for loans, but even now it compares unfavorably (from the investor's point of view) with what can be obtained in other directions.

(To be Continued.)

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Rates for Aerial Bomb Insurance in England.—The apprehensions of the English lest the Germans are seriously planning bomb-dropping raids of Zeppelins appear to become more acute, as time goes on. Even the recent assuring statement of Sir Hiram Maxim that the lateness of the season makes such raids now virtually impossible, owing to the inability of these air-craft to contend with Autumn and Winter fogs and storms, has seemingly had little effect upon English, and particularly London, property owners. Hence they are taking out aerial bomb insurance at Lloyds in large volume, and rates are advancing accordingly. The first policies issued three or four weeks ago were generally at a rate of about 2s. 6d. per cent for business property in London; but rates have recently been fully doubled. The latest quotations reported from England are as follows:

For London business premises—Damage from aerial bombs, 5s. per cent ($1.25 per $500).

War riots and damage by aerial craft—Ten shillings per cent ($2.50 per $500).

Rates on private houses are about one-half of the foregoing.

Rates on the East Coast vary according to the locality.

* * *

War Losses of the British, German and Austro-Hungarian Merchant Marines.—The "Insurance Observer," of London, calls attention to statistics published by the London "Times" on war losses suffered by the British, German and Austro-Hungarian mercantile marines from the beginning of the present hostilities up to October 8, and gives the following interesting summary of the present situation as to war risk conditions:

"The calculations are based on the number and tonnage of steamers owned by the three empires on March 31 last, as recorded by 'Lloyd's Register,' and the number and tonnage seized in port, captured at sea, or sunk through striking mines. They include steamers of 100 tons or more, and exclude fishing vessels and warships.

"There were 8,511 steamers of 18,273,944 tons gross registered in the United Kingdom. Of these 107 vessels, or say, 1.3 per cent, have been lost, representing 303,057 tons, or 1.6 per cent.

"On the same basis Germany owned 2,019 steamers of 4,743,000 tons. Of these 332 vessels, or, say, 16.4 per cent, have been [illegible], representing 81,234 tons, or about 1.7 per cent.

"Austro-Hungary owned 419 steamers of 1,010,347 tons. She has lost 41 vessels, or, say, nearly 9.8 per cent of the number, representing 131,710 tons, or 1.3 per cent.

"These figures show the preponderance of the British mercan-

tile marine and the very small proportion of loss, and the heavy percentage of loss suffered by the German and Austro-Hungarian mercantile marines. In considering the British figures, it is interesting to recall that the committee which prepared the State War Insurance Scheme assumed that there might be a loss during the first six months of the war of nearly 10 per cent of all British steamers employed in foreign trade.

"The figures given above have, like all statistics, their limitations. They do not take into account the number of vessels laid up: thus it is usual for underwriters to assume that in normal times a liner lies up for one month in twelve; freights were low before the outbreak of war and probably it would not be unreasonable to assume that quite 15 per cent of the tonnage of the three countries was laid up at the outbreak of war.

"There is also this fact to be remembered, that, while the German warships have been obliged to sink those British vessels which they captured, the German merchant vessels which have been captured by British warships will probably in due course be added to the British mercantile marine. The capture of British vessels is the price which is being paid for the maintenance of British oversea commerce. Germany gets no reward in the way of continued oversea commerce for the vessels she has lost.

"It does not necessarily follow, of course, that because the percentage of British vessels sunk has been small the profits of British underwriters are, or may be expected to be large. They have had to pay losses on a number of Scandinavian vessels which have been lost through striking the German mines in the North Sea. Moreover, a very large proportion of the British vessels have been insured with the War Risk Clubs and a large amount of the cargo has been covered under the State War Insurance Scheme. The uniform rates fixed by the Government office have naturally affected those in the open market, which has, as a rule, in order to attract business, been forced to quote rather lower rates, although the Government rates were never intended to yield a profit and had as their main object the encouragement and maintenance of trade. Then the liability at risk is often uneven. A single liner may be captured which in value may well be the equal of half a dozen others which have escaped. The amount at stake in the three captured liners, City of Winchester, Kaipara, and Diplomat, alone has been estimated at £1,000,000."

* * *

Population Statistics of Ireland for 1913.—The population of Ireland is still slightly diminishing, according to the fiftieth annual report of the Registrar General of Births, Deaths, and Marriages in Ireland, just issued. The number of recorded births in Ireland during 1913 was 100,004, as against 101,035 in 1912. The number of deaths registered in 1913 was 74,694, as compared with 72,187 in 1912. This indicates that while the death record is higher and the birth record lower than in previous years, still the births show a one-third excess over the deaths. This excess of 25,310 was more than offset, however, by the emigration of 30,967, leaving a net decrease of 5,657 in the population, or a total figure of approximately 4,373,419, which is almost equally divided into males and females.

The number of marriages registered in Ireland in 1913 was 22,266, as contrasted with 23,283 in 1912. This marriage record shows a rate of 5.08 per 1,000 of the population, whereas the average rate during the previous ten years was 5.2 per 1,000 of the population. Of the total number of marriages in 1913 the Roman Catholic Church solemnized 15,738, while the Church of Ireland celebrated 3,447, the Presbyterian Church 2,279, and civil magistrates only 331. In 1902 there was a ratio of 1 marriage to 193 of population, in 1907, 1 to 194 of population, but in 1912 it was 1 to 188 of population.

The total number of emigrants from Ireland since May 1, 1851, when the enumeration began, has been 4,278,327, a figure practically equal to the total present population of the island. Of this total emigration the males have exceeded the females by about 5 per cent. The distribution by Provinces of origin is shown by the following table:

From—	Total.	1906.	1910.	1913.
Leinster	737,743	5,079	4,258	3,994
Munster	1,431,836	10,054	8,330	7,807
Connaught	721,479	7,880	7,598	6,774
Ulster	1,226,470	12,331	12,271	12,392
Totals	4,167,583	35,344	32,457	30,967

The first total does not include certain non-Irish emigrants recorded in the total previously cited in the text. The table, which has been carefully compiled from official sources, indicates the extent to which the Providence of Ulster, in the north of Ireland, exceeds any other part of the island in furnishing emigrants. This is in contrast to popular beliefs on the subject, and indeed in contrast to former conditions. Of the total quantity of emigration since 1851 it appears from the above table that only 28.7 per cent had its origin in Ulster, while in the single year 1913 Ulster furnished precisely 40 per cent of the outflow. There is a disposition on the part of the Southern Provinces to regard this situation as a reflection upon the prosperity of Ulster.

The destinations of emigrants from Ireland are the United States, Canada, and Great Britain, with a few to South Africa, Australia, and New Zealand. During the six months ended June 30, 1914, the total emigration from Ireland was 12,909, of which 9,625, or 74.6 per cent, were destined to the United States, while 2,087, or 16.2 per cent were destined to Canada. It should be remarked that the Spring emigration of 1914 was notably lower than that of 1913, the 1913 emigration for the corresponding period having been 18,869.

While there is some diminution in the population of Ireland, it may be referred to for all practical purposes as stationary since the beginning of the present century. The population in 1903 was 4,417,757, while in 1908, five years later, it was still 4,384,664; and during the succeeding five-year period the decrease was almost negligible, the total number of inhabitants in 1913 standing at 4,373,419. It will be strange if the stimulus of altered legislative conditions in the immediate future does not reverse the trend of Irish population statistics.

* * *

The Decision of the Alabama Tax Commission on the Taxation of Cash Surrender Values.—In the issue of this paper for October 31, it was noted that the Alabama Tax Commission had reversed its previous ruling that all insurance policies with a cash surrender value were taxable. The original ruling of the Commission, which was issued to the County Tax Commissioners and which is now rescinded, was as follows:

"County Tax Commissioners.—After a formal and regular session of the State Tax Commission, and after consultation with the Attorney General, at which members of the Tax Commission were present, it is the unanimous opinion that all insurance policies with a cash surender value were taxable. The question having been carefully considered, the State Tax Commission and the Attorney General made the following ruling:

"All insurance policies with a cash surrender value are taxable, either as solvent credit or under sub-division 14, Section 2082, of the code, unless the amount of such cash surrender or a part of such cash surrender value has been borrowed from the company

issuing the policy. In a case of this character, the policy is taxable to the owner for the difference between the amount borrowed and the cash surrender value of the policy. If the entire amount has been borrowed, the policy is not taxable to the owner at all."

After the original ruling was made, the Association of Life Insurance Presidents asked for a hearing, and this was granted by the Commission, sitting at Montgomery, Ala., on Saturday morning, October 24. Attorney General Brickell was present at the hearing. The Association was represented by its attorney, Mr. Alfred Hurrell, and also by local counsel, Mr. Forney Johnston, of Birmingham. Mr. Hurrell filed with the Commission an extensive brief in which he discussed fully the legal, economic and practical sides of the whole question. A news letter of the Association of Life Insurance Presidents, recently issued, brings out the principal points touched upon.

The first point in the brief was that a cash surrender value was not a solvent credit as had been held by the Commission. On this phase of the question, among other things, the brief said:

"Sub-section 1 of sub-division 7 of Section 2082 of the Alabama Code says, in particularizing concerning certain classes of property, that the following shall be subject to the tax therein laid down:

" 'All money lent, solvent credits or credits of value, except such as are secured by mortgage, deed of trust, or written contract on conditional sale, upon which a tax imposed by law has been paid.'

"We suppose there will be no disagreement to the statement that a 'solvent credit' is that which is possessed by a person when another person owes him a debt and is able to pay. Applying this test to a policy of life insurance having a cash surrender value, it is seen that this feature of the policy (i. e., the right or privilege the policyholder has, at his option, of surrendering the policy and receiving a stipulated sum in settlement) is not a credit, because, while the insurance is in force, the company does not owe the policyholder anything. It, the company, is performing its part of the contract by keeping the policyholder insured and standing ready to pay the face of the policy when it falls due. * * *

"The cash surrender value in and of itself becomes a 'credit' only when the policyholder surrenders his policy and elects, from the options open to him, to receive the cash in settlement. He gives up his insurance, his protection, and takes the surrender value. He cannot have both at the same time. The company does not owe him, at the same time, both the duty to protect him by its insurance and the cash surrender value. Hence, when policies are in force (and it is these the ruling of the Commission affects), the companies owe the policyholders thereunder not cash surrender values, but the insurance protection itself, and, while they are under that primary and larger obligation the cash surrender value clauses of the contracts are not operative, and cannot be. * * * "

Other points discussed related to legal rules of construction which were invoked to sustain the contention that under the general property clause of the Alabama Statute, life insurance policies were not taxable.

In conclusion Mr. Hurrell urged upon the Commission the innumerable difficulties which would arise in the application of the original ruling. On this point he said:

"Another important consideration which the Commission will not wish to overlook is the confusion which would arise in the assessment of the cash surrender value of policies. Some policies have a definite beneficiary designated without the power of revocation being reserved to the insured. Some have a beneficiary named, but with the power of revocation reserved. Some run to the estate of the insured.

"This last class would probably present no great difficulty, but to whom would the policies be assessed in which a beneficiary was named,—to the insured who was paying the premiums, or to the beneficiary who was not? If the beneficiary's right is vested, then whatever might be due on a policy either as its matured value or its surrender value would be due the beneficiary and not the insured, and should not be assessed to the insured. In those policies where the right of revocation is reserved, until the beneficiary is changed, she is the one entitled to whatever may be due or paid under the policy. To assess the present value to the insured, the assessor would have to assume that the insured would revoke the then beneficiary and make the policy payable to his estate. To determine to whom these policies, many of them containing one or more beneficiaries, and many payable to infants, should be assessed would be the next task for the Commission. * * *

"Still another difficulty will be met if the Commission is not persuaded to adopt the views of the authorities presented. How are the policies which do not in terms stipulate a cash surrender value to be valued for assessment? It was not until 1907 that any considerable number of States required life insurance companies to provide in the policy for a cash value on surrender. Before that time some companies provided such a clause voluntarily, and others did not. The result is that a large number of old policies must be outstanding now without such a clause, but concerning which the reserve accumulations are greater than the newer policies issued, say in the past twenty years. It surely was not the intention by the ruling to make the newer policies assessable merely because of the incident of the cash surrender clause therein, while the older and more valuable policies went free. Such would produce discrimination between policyholders and would lead to an unequal distribution of the tax on this new class of taxable subjects."

* * *

The Plate Glass Insurance Alliance of America.—An entirely new organization composed of eleven companies has grown out of the demoralization in the plate glass insurance business owing to the disruption of the Plate Glass Underwriters' Association. The new body known as the Plate Glass Insurance Alliance of America will operate along entirely different lines from any of its predecessors.

As soon as it became apparent that the Plate Glass Underwriters' Association was doomed steps were immediately taken to stem the tide by the organigization of a new board. The following officers were elected:

Chairman, R. A. Dobbin, Jr., of the Fidelity and Deposit of Maryland; vice-chairman, H. C. Heddon, of the New Jersey Fidelity and Plate Glass; secretary-trasurer, Nelson D. Sterling, of the Fidelity and Casualty.

INSURANCE NEWS IN THE WEST

C. H. Barry Suggested as President for Pennsylvania Fire.—Announcement of the resignation of Col. R. Dale Benson as president of the Pennsylvania Fire has created interest in Chicago. Friends of Charles H. Barry, Western manager of the company, express the opinion that the committee appointed to select a successor to Colonel Benson would make no mistake in agreeing upon the head of the Western department to be the head of the company. Mr. Barry has made a prominent place for himself in Western fire underwriting. Very few managers have done more work in the Western Union. He has been a member of the governing committee and also its chairman. In his relations with other managers he has carried a reputation as a level-headed, conservative, strong man.

* * *

An Incident of the Underwriters' Agency System in Chicago.—

One of the foolish and inconsistent things that grow out of the underwriters' agency system came to the surface a few days ago. For reasons known to itself the Westchester Fire took up its agency in the office of H. Dalmar & Co. This would be assumed to prove that the company and the agency had found their relations unsatisfactory on one or both sides. However, very little time elapsed until the Delaware Underwriters of the Westchester announced the appointment of H. Dalmar & Co. as Cook County managers. This arrangement did not last long, as S. Schwartz, Western manager of the Westchester, protested to the home office, so it is stated, against the action of the annex and it was called off. That did not make the situation any less ludicrous while it lasted, however, for it appeared that the business that the Westchester had carried directly was to come to its books indirectly as fast as it expired, through being written by the underwriters.

* * *

Co-operation in Field in Cook County.—The Cook County field men now feel that they have the co-operation of their managers better than ever before. For some time the field men have had an organization, of which over 90 per cent of them were members. The failure of the other 5 or 10 per cent to join, however, interfered seriously with effective work, as it was difficult to enforce prompt payment of balances or other reforms among the agents of the county so long as a few field men refused to work with the rest. Recently the organization gave a dinner, with the managers as guests. There was a general interchange of views, with the result that the managers volunteered to appoint a committee of their number to call upon those managers whose field men are not in the association and endeavor to have them instruct them to join. They left little doubt of their ability to succeed on this mission.

This is an opportune time to do some good work in Cook County. The class 2 (suburban) agents have been making demands for more consideration and have been confronted with the statement that many of them are not insurance agents at all, but mere premium grabbers, looking out for their commissions, but not giving the service that real agents and good brokers give. They have insisted that they are real agents. It appears to be up to them to prove it, and one way to do this is to co-operate with their field men in their efforts to have business done in the county in the best way possible.

* * *

The Insurance Federation of Iowa.—The Insurance Federation of Iowa was organized a few days ago in a manner different from any other federation started in the West up to this time. In most of the States the federation movement has had agents and general agents as its chief backers. In Iowa nearly all the officers and several members of the executive committee are officials of Iowa companies of all kinds. Represented in it by officials are stock, fire, life and accident companies, mutuals of several classes and fraternals. Leading agents of the State are also prominent in its counsels. It is a thoroughly representative body and, when it gets more policyholders in it, as it expects to do, it will be still more so. The State is to be organized by congressional districts. One of the first results is co-operation of the Employers' Mutual Casualty Association with the stock company agents to oppose the State fund plan of Industrial Commissioner Garst. Heretofore the mutual had shown some signs of favoring such a plan. As it is in close relations with the Iowa Manufacturers' Association, it doubtless can wield a strong influence. Several of the officers of companies represented in the federation are past or present members of the Legislature and others are associated in their own companies with men who are powerful in Iowa politics. No radical programme has been laid out, but an effort will be made to create a healthier sentiment and a better understanding of insurance in the State.

* * *

Death of Howard H. Hoyt.—The death of Howard H. Hoyt, of Chicago, this week removed a conspicuous figure from among the life insurance producers of the city. A number of years ago Mr. Hoyt was superintendent of the Equitable of New York, at Chicago, supervising Illinois agencies. Later he was connected with the Columbian National Life in a supervisory capacity at Chicago. Then he was general manager of the Chicago Life for a short time before its reinsurance. Then he quit working for a salary and became an agent of the Mutual Benefit. He soon became one of the large writers in the city. Within the past few months he became a general agent of the National Life, U. S. A., at Chicago. Not only was he a large producer of business, but he had unusual facility as a writer upon life insurance topics. Many of the members of the National Association of Life Underwriters will remember him as one of the prize essayists a few years ago.

* * *

Mr. Hubbard Extends His Field of Endeavor.—B. V. Hubbard, of Chicago, who requested Superintendent Potts, of Illinois, to revoke the license of the Illinois Indemnity Exchange, has filed a similar request in regard to all the interinsurance exchanges doing workmen's compensation business in Illinois. As additional reasons for revoking the license of the Missouri exchanges operating in Illinois, he points out that they are not licensed in their home State, as the Supreme Court of Missouri declared the law under which they had been licensed unconstitutional. But, he says, they could not lawfully be licensed in Illinois even if this were not the case. Mr. Potts has named November 16 as the date when he will hear arguments from Mr. Hubbard and also from representatives of the exchanges.

Whatever action Mr. Potts may decide to take in the premises, Mr. Hubbard's complaint has received considerable publicity and has tended to stir up doubt as to the legality of the exchanges among those who knew nothing about the alleged irregularity in their licenses.

* * *

Hernia Under the Michigan Compensation Law.—On November 11 the Supreme Court of Michigan is to hear arguments in a case the decision on which is expected to fix the status of hernia under the compensation law of the State. The claimant, like many others who seek to collect money from insurance companies for disability due to hernia, contends that hernia is an accident. The Employers' Liability, which was the insurance carrier in this case, contends that it is a disease. The Supreme Court of Michigan already has decided that the law does not provide for compensation for disability due to occupational diseases. From this it is inferred that still less does it provide for compensation for non-occupational diseases.

The status of hernia has had to be passed upon by the industrial commissions of several of the States having compensation laws. A few court decisions should help settle the question, provided they are reasonably uniform. This is a question of great interest not alone to liability companies, but to personal accident companies as well, as they have paid out thousands of dollars on hernia claims under accident policies, much of the time doubting whether they ought to pay a cent, but apparently unwilling or unable to put up a strong defense.

Chicago, November 6, 1914. LA SALLE.

ITEMS OF INSURANCE NEWS.

Insurance Commissioner Ekern, of Wisconsin, has recently issued the first annual statement as to the progress of the State Life Insurance

Fund. The State Life Fund Law was passed June 7, 1911, and the Insurance Commissioner was allowed two years in which to promote the scheme. On July 1, 1912, he announced that he was ready to receive applications for insurance, but that no policies would be issued until a satisfactory number of applicants had been approved. This event occurred on October 27, 1913, something over two years and four months after the law went into effect. The total number of policyholders on October 27, 1914, is given as 311, carrying total insurance in the Fund of $219,602, an average of $706.11 for each policyholder. The premiums received during the year amounted to $11,029, while claims paid were $2,245. The reserve fund stands at $7,138, leaving a balance for expenses of management of $1,646. Under the law something more than two dollars per thousand of insurance is included in the premium charge for expenses, but according to the statement of the Commissioner there have been no expenses so far. With accrued interest on the investment, total assets are stated as $11,394, which includes $4,950 invested in first mortgages at 6 per cent.

Uniform legislation on fire insurance rate-making has been undertaken by the National Convention of Insurance Commissioners, and through a special committee of that body Commissioner Ekern, of Wisconsin, is pushing the idea. He has prepared tentative drafts of six bills for uniformly regulating rate-making and encouraging fire prevention. These he is sending out to interested persons for criticism and suggestion so that he can present the results to the special committee in December.

In his biennial report to the Governor, State Auditor Coffman, of Arkansas, makes the following recommendations as to the supervision of insurance in that State:

"The growth of the insurance business in the State makes it one of the most important branches of the State Government. There is collected from the insurance companies doing business in the State of Arkansas for the year 1914, $176,941.15. This is done at a very small expense. The Legislature appropriates only $2,000 for a deputy Insurance Commissioner, which is not giving the insurance companies the service for the amount they pay, and more money should be appropriated for the running of the insurance department. There will be a national insurance meeting in San Francisco in 1915 and the State of Arkansas should be represented at that meeting.

"As soon as the financial condition of the State is sufficient there should be established a separate department known as the Insurance Department for the purpose of transacting the insurance business. The amount of revenue derived from this source should enable the State to have such a department. If the funds which were derived from the insurance companies were set aside for less than ten years, it would pay the indebtedness of the State."

Insurance against sickness may soon be undertaken by the State. It is now being agitated by the Ohio State Medical Association. It is suggested that the compulsory workmen's compensation law should now be followed up by such an experiment. It is proposed that the State insure workingmen against loss incurred through disability by sickness. Thus, it is asserted, the injustice of forcing employes to suffer the entire loss caused by so-called occupational diseases would in a measure be alleviated.

That this proposal is already being considered seriously by State authorities is indicated by the fact that statistics as to the prevalence and nature of occupational diseases are being prepared by the State Board of Health and a report will be made to the Legislature when it convenes in regular session next January.

The American Association for Labor Legislation is also behind the new movement and the Ohio Federation of Labor is planning a campaign for enactment of the necessary legislation.

As illustrative of what the British Life insurance companies are doing to make easier the lot of those who are going to serve their country at the front, the action of the Atlas Assurance Company is interesting. Although the Life Offices' Association has recommended that an extra charge of £7 7s. 0d. per cent be charged for the war risk on lives, this company is prepared to issue policies for the payment of the sum insured at the end of twenty-five years, or at death, if previous, the policies to share in the profits of the company, at the following rates of premium for various ages:

Age Next Birthday.	New War Policy.	Ordinary (Civilian) Policy.	Difference.
	£ s. d.	£ s. d.	s. d.
20	0 5	1 16 11	3 6
25	1 1 10	1 15 3	3 7
30	1 4 6	1 0 9	3 7
35	1 7 1	1 4 5	3 8
40	1 11 2	1 8 4	3 10

It will be seen that if the policyholder lives and pays twenty-five years the difference will work out at 3s. 7d. only.

The Atlas is prepared to grant these policies to Territorials and members of Lord Kitchener's Army, who in ordinary times follow non-hazardous occupations. And they cover war risks on foreign residence. In fact, the contracts are absolutely unconditional. Further, these policies are granted without medical examination to all who within a month of making the proposal have been passed as fit for Army service by a military doctor.

H. G. Askew, statistician for the Texas railways, reports that thirty-five of the companies in the fiscal year ending June 30 last, paid out for personal injury claims $2,556,117, an increase of $80,118 over the amount paid for the preceding year. Mr. Askew says:

"Those who have given the subject of personal injury payments the closest study aver that not over one-half of the vast total paid by railroads in settlement of personal injury cases reaches those injured or the heirs of those who are victims of accidents incidental to transportation. If this statement is to be accepted, it is apparent that for the last fiscal year thirty-five railroads paid out $1,423,058, which amount under any system of economics having standing can be denominated only as waste. At 10 cents a pound this wasted sum would be sufficient to purchase over 50,22 bales of cotton. At the average yield of cotton in Texas during the present year it would require almost 170,000 acres to produce the cotton that could have been purchased by the waste incidental to methods that prevail under legislative sanction for the handling of personal injury cases."

The first concrete suggestion for the amendment of the New York State Workmen's Compensation Law comes from the New York Board of Trade and Transportation, which group feels that the first desirable change in this law will come from removing the discrimination between employes engaged in hazardous and other classes of employment. They state that the fact that accidents seldom occur in non-hazardous occupations does not remove the necessity or justification for compensation, should an accident occur, and, therefore, they believe that the act should be inclusive.

The Bureau of Foreign and Domestic Commerce has received from American Minister Nicolay A. Grevstad, Montevideo, Uruguay, a copy and translation of a law recently passed in that country to prevent accidents to employes in industrial establishments or engaged in industrial work. The law applies to factories, mines, quarries, or any other places in which the work involves danger to the life or health of workmen. The rules concerning the installation of machinery and the protection or screening of dangerous parts of machinery are of a general character, and provide for regulations in detail to be formed later by the Executive. The law also prohibits the employment of women and children in the cleansing or repair of motors or machinery in motion. The copy in Spanish and translation of this law will be loaned by the Bureau.

With the exception of Massachusetts, all State insurance departments have agreed to allow the insurance companies to list securities held by them at prices quoted June 30, 1914, in statements made January 1, 1915. The quotations of this date are from two to seven points higher on stocks than the quotation of July 30. No definite statement has been made by Commissioner Hardison, of Massachusetts. The total value of securities of this nature held by insurance companies is estimated at $2,000,000,000.

Two important developments under the new Maryland workmen's compensation act appeared on October 24. One was the opinion handed down by Assistant Counsel J. W. Loud, of the Maryland Industrial Accident Commission, that the City of Baltimore and the State of Maryland when acting as employers must stand on the same footing as private employers. This signifies that the municipalities of Maryland must protect themselves as against their liabilities toward employes, who may suffer an injury while working for the public authorities. The other was a ruling by the Commission as to the minimum deposit to be required of all employers electing to carry their own risks. This minimum is put at $5,000, and the amounts will range upward according to the size of the pay rolls and the amount of danger involved in the various forms of employment submitted for employe insurance security under this law.

The constitutional amendments in Wisconsin, to allow the State to furnish all forms of insurance to its citizens, which were subjected to popular vote at the election just past, were all defeated. The term of H. L. Ekern as Insurance Commissioner of Wisconsin expires early in 1915. As he strongly opposed Governor-elect Philip, a change is regarded as assured.

In Michigan the amendment to the constitution proposed under the new initiative law affecting fraternal insurance was defeated, and as Governor Ferris was re-elected the reappointment of Insurance Commissioner Wiltsie is expected.

In Kansas Carey Wilson was elected Insurance Commissioner, it being an elective position in that State. Mr. Wilson has been deputy in the Insurance Department for several years. The re-election of Governor Morehead in Nebraska is regarded as assuring the retention of Lawson C. Brian as Insurance Commissioner. For the same reason the re-election of Insurance Commissioners Taylor, of North Dakota, and Stabler, of South Dakota, is expected. Insurance Commissioner Preus, of Minnesota, was a candidate for State Auditor, and as a Democratic Governor was elected a change in that State is certain.

FINANCE AND COMMERCE

Financial and Commercial Review.

Banking Situation at Home and Abroad.

Statistics of Cotton and Coffee.

Market Prices of Securities and Commodities.

SOME new phases of the war factor in the banking and business situation have been presented in the past week. Turkey's definite inclusion in the ara of belligerency will presumably bring other countries, hitherto neutral, into the field of hostilities. In the end it is inferential that the Allies will be the chief gainer by the accessions and to that extent the widening scope of the war may be regarded as making for a shorter duration of the conflict, although it is not at all safe to base any economic conclusions on such a stupendous contest as that in which the bulk of Europe and part of two other continents are involved.

Now, however, a new element is introduced into calculations by the further triumphs of the German navy. British naval prestige had suffered not a little before the engagement off the Chilian coast, but it is doubtful if the military implications of the naval situation qualify very much the implications of the land fighting. What does affect us is the increasing menace, offered both on land and sea, to the expansion of our external commerce on which so much reliance has been placed for the almost automatic adjustment of our financial and business position to the circumstances which the war has created. If Italy goes into the war it will mean an absolute blockade of our trade with Germany and Austria, for the British declaration that the North Sea, because it has been so thoroughly mined, is a military area likely to shut off commerce with Holland, Denmark and Baltic countries, or at least, if not to shut it off, to reduce it to negligible proportions. The chances would seem to be that for a while longer anyway our export movement will be sustained, but it is a fortunate thing that we have done so well in getting goods out of the country this Autumn to help discharge our foreign indebtedness on current account. There is no assurance that the movement can be indefinitely maintained even if a large quantity of goods and commodities keeps going forward to the Allied countries under naval protection.

Perhaps for that matter it would be just as well not to lay excessive emphasis on the foreign trade factor in our prospects for restoring some degree of prosperity to American enterprise. It should be recognized that our foreign trade to-day is of a very feverish and artificial character in the main, as it is owing so largely to military necessities which have compelled the liquidation of foreign goods here and the purchase here of merchandise and staples. It is gratifying from the financial point of view that, whatever the causes of our partial recovery in exports, our shipments of goods and commodities have served to lessen somewhat the difficulties arising from our foreign debit balance. Washington estimates that there was an export excess of $50,000,000 in October on incomplete figures showing a $43,000,000 excess, but the October balance a year ago was $138,000,000 and imports last month showed an actual gain, while exports were probably not more than 80 per cent of the shipments in the corresponding month last year.

A striking feature of trade conditions is that general business seems to have derived no very clearly beneficial influences from the export trade. Bank clearings show that business as a whole is perhaps not more than 75 per cent of normal and unless some stimulating impulses are provided general economy is going to be an enforced virtue this coming Winter. It is unfortunate at such a juncture that the spread of foot and mouth disease among the country's cattle should have compelled quarantine measures at Chicago stock yards and elsewhere for this is a disturbing portent of high prices for meats before long. A very fair gauge of trade and industry is afforded by the persistent conjecture that a reduction of wages is more or less imminent at the steel mills.

Not all the aspects of affairs permit such depressing inferences. The British moratorium has come to an end without any disruption of financial conditions in sight. This may be owing in part to the fact that the way has not yet been cleared for a reopening of the London Stock Exchange, although plans which prepare for a reopening are under discussion. Allowing for the very uncertain hazards of the war the British banking community seem to be in comfortable shape which is of encouraging omen for us and from the American standpoint the money market, domestic and international, is propitious for general business improvement. In the foreign exchange market sterling bills, the only form of exchange which we have seriously to consider, have this week hovered around the 4.90 level, to which they fell a fortnight ago, and while it is too early to say that they may not rise sharply again to the prices from which they have recently declined, a hopeful assumption is warranted that our position in the international exchanges will become better and not worse.

As nearly as a forecast may be ventured upon in times like these, it may be predicted that exchange will turn more or less irregularly, but definitely in our favor, unless the Allies on sea as well as on land suffer decisive defeat. Sir George Paish and Secretary McAdoo, in their conferences with the Federal Reserve Board, as well as with unofficial representatives of banking and business interests, seem to have arrived at an understanding that there is a very positive limit to our ability to make exports of gold and an agreement of this sort is conducive to arrangements for a resumption of regular business in the organized security markets. It must be remembered nevertheless in dealing with the financial outlook that the problem of protecting money supplies from the drafts which liquidation of securities might make upon them has yet to be solved.

Even the cotton exchanges have not yet been reopened, although progress in that direction is reported and the restoration of the future market in cotton is of much importance to our foreign trade and consequently to foreign exchange. Apropos the cotton market it is worth recording that the promoters of the cotton loan fund have been encountering obstacles in rounding up the banks in support of the scheme and it would do no harm if their attempts ended in failure. The loan fund is not at all essential to the reopening of the cotton exchanges and with their reopening the various troubles of the cotton trade will take care of themselves.

It might be remarked, incidentally, that thoughtful observers have been disagreeably impressed by the fashion in which the Federal Reserve Board committed itself to the supervision of the cotton loan fund project. This was one of several matters that have made the judicious pause in acceptance of the enthusiastic anticipation with which the establishment of the Federal reserve banking system has been awaited. It would be very unfortunate indeed if the administrators of the new banking system should show themselves responsive to such political pressure as was an element in the projection of the cotton loan plan. There is risk that it may be extremely sensitive to political considerations unless the majority of the reserve board displays at the outset a dispo-

ition to challenge the manifest purpose of Secretary McAdoo and Comptroller Williams to make the board a mere department of the Treasury.

In other respects the signs of money are all auspicious. Interest rates are in a state of relaxation and the rising tax on emergency currency as the rates for money fall is contributing to the retirement of the extra circulation. New York banks alone withdrew about $20,000,000 of emergency currency in the past week and outstanding clearing house certificates are being steadily contracted at different centres. The circumstances of money are reflecting themselves more and more in the moderate growth of investment dealings in securities which as stocks and bonds change hands are helping in turn to ease the banking position.

Altogether there is enough in the monetary situation and in the extent to which business and banking readjustments to the war have been completed, to suggest that with restored facilities for liquidating capital commitments in the securities market and obtaining capital therein some beginnings of general business recovery might soon be made. As money becomes easier it will have a tendency to stimulate the efforts of manufacturers and merchants to do more business and permit the foreign trade movement to exert some influence over domestic trade.

On this account it is more than likely that the results of Tuesday's election will be to contribute to general business betterment. The election returns were promptly reflected in a stiffening of prices for securities in Wall Street, and had the Stock Exchange been open it is safe to say that despite the war abroad stocks would have made a rousing rally on election news, even though because of the war they might not have been able to hold their gain. The war seemed to make so much change in the political outlook that bankers and business men were hardly prepared for such a widespread loosening of Democratic control on Government but the vote lent itself to very optimistic deduction. It showed that the Republican party had practically closed the division in its ranks caused by the Roosevelt secession in 1912 and without assuming that the Republican party is on its way back to power, business interests must nevertheless feel that the necessities of business will henceforth be more considerately regarded by Government.

London	22 5-16	22 5-16	....	22 11-16	23	23

COTTON

November 7, 1914.

AS regards cotton itself, the past week has been marked by a decided stiffening of prices all over the South, and particularly in Texas, The weak, irresponsible and impecunious farmers appear at last to have disposed of their cotton, and the cotton trade from now on will have to deal with producers who are resolute enough and have financial strength enough to carry their cotton until they can obtain for it a price more nearly approaching the cost of production. It is to be expected, of course, that there will be constantly a moderate flow of cotton into the markets; and if the price were to advance further it is certain that this flow will increase in volume. But the more independent Southern farmers have got over whatever panic may have infected them at the outset of the ginning season; they have come to see that it is poor business judgment to sell cotton now at 7 cents per pound and then within a few months set about the production of a new crop which will cost them 10 to 11 cents per pound to produce. They had better keep this year's production to serve as next year's crop than to be stampeded into such economic foolishness. It is a decidedly gratifying thing, moreover, that this new state of things has been brought about by the general common sense and courage of the Southern farmers, instead of through lavish advances from the government, National or State, or from a great subscription loan fund. There is no doubt whatever that the cotton situation has been a very grievous one to all those Southern communities in which the production of cotton is the economic mainstay. But every section of the United States, save those producing foodstuffs, has had its heavy burden of one or another kind to bear. The European War has left few untouched. Yet there has been little whimpering and no great movement to provide financial relief except such as was started on behalf of the alarmed South. There is now evidence enough that the great sound and wholesome South, as distinguished from the small but noisy vaporing and demagogic South, is turning away from its own self-appointed spokesmen, is showing a resolute and cheerful face, and is proposing to take care of itself, as it has in the past done, to the admiration even of its enemies. It may be that the necessity of supporting cotton, instead of being supported by it, will entail a longish period of self-denial; but the South is ready for it and will not complain. And, best of all, the realization that this is the case is sure to give courage and incitement to action on the part of all those concerned with cotton, who are just at the point of resuming their normal activities, whether on the exchanges or outside them. The resumption of general trading in cotton is nearly approaching. Another fortnight should see both the American futures markets, New York and New Orleans, in operation. The Liverpool Exchange has already arrived at the point of permitting trading in future contracts, even though only in a tentative way and with restrictions both as to price and as to the deliveries dealt in. With trading in future contracts possible, the making of all manner of contracts for cotton in all its varieties and qualities, both for present and for future delivery, becomes also possible. The distribution of the burden of the present surplus over coming months and years is thus begun; the acquisition of cotton in quantity, whether by actual users of it or by those who are attracted to invest in it, is encouraged; the confidence of bankers in cotton as collateral for loans is restored; and all the wholesome activities of trade are enlisted on behalf of cotton. No sensible person, of course, expects that all these forces will become effective in a day or in a week or in a month; or that there is to be a sudden upward rush of the price of cotton to a level which means a clear profit to the producer over and above the average annual cost of production. It were folly to anticipate any such occurrence. The cotton producer, like the great majority of his fellow citizens, is going to have an unprofitable season; but he is not going to be ruined nor permanently weakened and crippled. And he will soon have a continuous and calculable market for his cotton, upon which he can sell so much of his production as his real necessities require. Little by little, he will lighten his load of unsold cotton, on the one hand, and of indebtedness, on the other; and he will be able to enter upon the new season, free to choose for himself whether to devote his land to other crops or to plant a sufficient acreage in cotton to supply the demand that has made itself manifest, notwithstanding the European War. The world will be clothed, and clothed for the most part with cotton; and it is safe to say that there will be many surprises, before the present season is over, with respect to the amount of cotton consumed, war or no war.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The following were the high, low and closing bid prices for each delivery, on Friday, July 31, in cents and hundredths of a cent per pound, gross weight:

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	153,290	501,248	521,274	326,082
Overland to mills and Canada	39,941	38,368	37,578	40,055
So. mill takings, est., exclusive of takings from Southern ports	9 ,000	90,000	90,000	70,000
Gain of stocks at interior towns	69,938	35,594	37,006	91,967
Brought into sight for week	653,169	665,210	685,858	528,104
Total Movement—

Rates and Rules Adopted by Fire Insurance Companies for the Emergency Storage of Cotton.—The fire insurance companies composing the South Eastern Underwriters' Association (which includes practically every company doing any considerable insuring of cotton) have agreed upon specifications for the construction of emergency warehouses and regulations for the storage of cotton therein satisfactory to them, thereby to meet the present difficulties as to storing the surplus cotton of the South and to make possible reasonable insurance rates upon such cotton as cannot be taken care of in more substantial buildings. We give below the specifications, rules and rates as issued for the use of the fire insurance companies themselves.

* * *

COTTON RISKS.

Specifications for construction of emergency storage shed (to be detached 100 feet in the clear and not exposed by passing locomotives on main line of track within 100 feet).

Construction.—Sheds or units may be constructed of light frame work, to be not less than 16 ft. wide by 35 ft. in height over all. Roof to be of joist construction covered with approved composition roofing, to be supported on eight posts; six 4 by 4 inches by 6½ feet long, and two 4 by 4 inches by 27 feet long, arranged three posts, each end supporting eaves of shed, which are to extend to within 4 feet of the ground, and two posts in middle of shed supporting 2 by 6 inch ridge pole. All posts to be set 12 inches in ground. Sides and ends of sheds may be open, if not exposed within 100 feet by railroad main line, or open and switch tracks.

It is recommended when feasible, that composition roofing be used to enclose ends of shed from peak of roof down to within 4 feet of ground, so as to fully protect cotton from weather.

Metal sheets must not be used for enclosing ends or sides of sheds.

Arrangement.—Cotton to be stored in sheds (units) and bales to be arranged in two tiers, end to end, not exceeding thirty-six bales each, eight bales in bottom layer of each tier, each layer from bottom up to contain one bale less than layer next below, to be

Associate Members of Liverpool Cotton Ass'n

Cotton for Spinners' Use

piled not exceeding eight layers high, the total not to exceed seventy-two bales in each unit. The tiers are to be supported on stringers as follows: Three, 4 by 4 by 10 mud sills laid on ground lengthwise with shed and bales, and at right angles to line of tiers, these in turn to support four 4 by 6 by 15 stringers laid at right angles to mud sills and spaced about three feet apart, so as to properly support the bales. Bottom line of first (lower) layer of cotton to be at least 10 inches above ground, cotton to be piled and tiers so ararnged that eaves or extreme ends of roof will extend three feet beyond line of cotton.

Units must have at least 25 feet clear space on all sides and ends, and be arranged in groups of not exceeding 15 units, groups to be enclosed with a six-foot board fence with fifteen feet clear space between fence and ends or sides of units, making an enclosure area of 128 by 305 feet (39,040 square feet). One hundred feet clear space to be maintained between groups. Two or more may be included within the same fence enclosure, provided 100 feet clear space is maintained between each group.

Warranty to be attached to policies that not exceeding 72 bales will be stored in any one unit, and not exceeding a total of 1,080 bales in any one group.

RATING SCHEDULE.

Cotton Risks.—Emergency Cotton Storage Sheds. (Detached 100 feet.) (To apply to all places and at all locations, except for cotton stored on river banks or at plantations.)

Basis 1.75

Add for deficiencies as follows:

(1) Fire protection, none or not standard..... .25

(2) Less than one cask and four pails for each shed, casks to be placed at each shed and pails to be hung on each corner of shed ..... .50

(3) No watchman and approved watch-clock..... .25

Note.—No credit to be given for watchman without approved watch-clock.

(4) (a) Storage of lime and or oils; (b) use of any portion of the premises for stabling purposes; or (c) for camping, each 1.00

(5) Accumulation of loose cotton on yards or under sheds 1.00

(6) Unless protected by 6-foot board fence, as per specifications ..... .25

(7) If enclosed by barbed wire fence ..... .25

Note.—Charges 6 and 7 are accumulative.

(Continued on Next Page.)

NEW YORK QUOTATIONS FOR STANDARD COTTON GOODS AND YARNS

Charge for exposures, other than provided for in schedule, as per mercantile exposure table.

THE RAILROADS—THE ONE COMMON INTEREST OF OUR INDUSTRIAL LIFE

THE situation of the railroads of the United States is at last perceived to be a critical one. This fact has come to be appreciated very fully by the more far-seeing of the leaders of our business world. That it ought to be appreciated by them all has been fully recognized by President Wilson in his letter to the Committee of Railroad Executives whom he recently received in Washington, to listen to their renewed appeal that the authority of the Government should be exercised in favor of, and not against, an increase in the revenue of their roads.

"You ask me," said President Wilson, "to call the attention of the country to the imperative need that railroad credits be sustained and the railroads helped in every possible way, whether by private co-operative effort or by the action, wherever feasible, of governmental agencies, and I am glad to do so, because I think the need very real. I am very confident that there will be active and earnest co-operation in this matter, perhaps the one common interest of our whole industrial life. Undoubtedly, men, both in and out of official position, will appreciate what is involved and lend their aid very heartily wherever it is possible for them to lend it."

Shortly after this expression of the President's opinion was made public, it was announced that the Interstate Commerce Commission would grant a new hearing to the Eastern railroads which had previously applied for an increase in rates and had been given, to put it mildly, only half a loaf. On October 19, this new hearing began. As an illustration of the widespread interest with which the result is awaited, not only in this country but abroad, the following paragraph from the London "Statist" of September 26, is worth quoting:

"It is a matter for sincere congratulation to all interested in the economic welfare of the United States that the Interstate Commerce Commission has agreed to reopen the application by the Eastern roads for an advance of 5 per cent in freight rates. The new inquiry will commence on October 19, and it is stated will be confined to a presentation of facts relating to recent developments. That, in view of the exceptional existing circumstances, the railway companies will not have again appealed in vain for permission to make a small increase in their transportation charges is generally believed."

The essence of this statement is that a something new has appeared in the situation of the railroads of the United States. The logic of events,—the "exceptional existing circumstances," as the "Statist" puts it,—has made suddenly and visibly untenable the position which the Interstate Commerce Commission has tenaciously clung to for so long. The hand of the Commission has been forced,—immediately by the President, but really by a body of long accumulating facts, all at once made compelling by that which the European War has made manifest. There is, however, a long history behind it all; and perhaps this is the moment to survey that history.

In 1830 the extent of railroads in operation in the United States was twenty-three miles. At present our railroads have over 370,000 miles of track, or enough completely to encircle the earth sixteen times. The total mileage, excluding switching and terminal companies, is given in the Statistical Abstract of the United States as 258,033 miles, in 1912. The mileage in operation in the United Kingdom at the close of the same year was 23,441 miles; in France, on the same date, 31,391 miles; and in Germany on March 31, 1913, 39,065 miles. The railroad mileage of Great Britain increased by only twenty-four miles during 1912, while 3,301 miles of railroad were built in the United States during that year. This comparison is not made without consideration of the extent of territory involved, for obviously the needs of the United States in the way of railways are vastly greater in this regard. However, to take a more nearly analagous case, it appears that the total railroad mileage of Russia, both European and Asiatic, a territory considerably more than twice as large as our own, was 46,753 miles in 1912, an increase of only 728 miles over the total for 1911. The record of yearly increase in the railroad mileage in the United States is a remarkable one. The average annual increase from 1832 to 1848, inclusive, was 347 miles; from 1849 to 1860, 2,051 miles; from 1861 to 1878, 2,985 miles; and from 1880 to 1889, 7,472 miles. The greatest single year was 1887, in which 12,876 miles of new road were constructed, or in a single year more than half the present total mileage of the United Kingdom. This was the height of the pioneer movement. The new mileage during the past twenty years has ranged from 1,895 miles to 6,690 miles annually; and the four years ended with 1912, which show a slightly lower comparative total because switching and terminal trackage was included previous to that period, present the very respectable annual average of 4,296 miles of new track.

As has been said, this system of American railways, which ex-Ambassador James Bryce has referred to as a "prodigy of labor, wealth, and skill" and which is in fact unparalleled among the world's economic achievements, has had a history crowded with interest and with that unique form of romance which was characteristic, to seeing eyes, of the vast commercial and industrial expansion of the nineteenth century. But it is possible here to touch only upon the main evolutionary features, which are most apt to render intelligible the recent attitude of the American public toward the railroads as a whole. In the first place, it should always be borne in mind that the period of early development, or pioneer work, involved risks of the most daring speculative character, which seem to be no longer a necessary element in railroad economy. In the early days, however, common human nature did not incline to withhold from persons assuming those risks a reward commensurate with the adventure. Indeed, for the purpose of encouraging the extension of railroads over regions scarcely known to white men, over deserts and mountains which seemed to afford small prospect of ever permitting human habitation, and certainly never could permit it in default of railroads, 129,000,000 acres in the aggregate, whose value to-day is a truly fabulous sum, were granted by Congress to the Northern Pacific, the Atlantic and Pacific, the Union Pacific, the Central Pacific, the Southern Pacific and the Kansas Pacific. In addition to this, money grants exceeding $60,000,000 were willingly accorded by the National Government. Unstinted generosity appeared to have become the assured policy of the country towards the railroads. And the railroads, for their part, swept across the West, as well as covered the

East, everywhere opening the way to the fuller development of our national resources.

During the years of this rapid growth the attitude of the public toward the railroads was one of more than confidence. It was one of constant encouragement to greater expansion.

"The demand for participation in their benefit," says Schouler's "Bailments and Carriers," "went up from every city and hamlet in the land, and the public was impatient of any obstacles to their free construction. * * * Under an imperative popular demand general laws were enacted in many States which enabled projectors of roads to organize at pleasure."

Popular demand for extensive railroad expansion resulted in a large body of legislation, which invited unscrupulous and unskilful promoters, while retaining almost no control over their adventures with the public funds advanced them. Public credit was loaned to innumerable projects which were ill-advised, and a large proportion of the money so obtained was entirely wasted. In 1887, according to Schouler, there were 108 railroads, representing 11,066 miles of track, in the hands of receivers. All this began to create a revulsion of sentiment.

It gradually became apparent that unstinted generosity on the part of the American public was not to be the permanent portion of the railroads. At the very time when the general attitude toward them appeared to be most acquiescent as regards their extra-legal power to control not only their own affairs, but the affairs of vast sections of the country,—whole States and groups of States,—the seeds were being sown for a revolution of the popular mind about them. Their owners and managers in some cases held themselves superior to the wishes or economic needs of whole communities; they did not hesitate to take upon themselves to decide whether cities should wax or wane, whether industries should flourish or not, and whether economic opportunity of all kinds should be granted here or there; they unhesitatingly brought all their vast powers to bear to control legislatures and even at times Congress itself; they commanded or threatened or cajoled, as the case might require. In particular, they roused innumerable animosities against them on the part of their chief immediate customers, the shippers of commodities, who as a class saw themselves helpless to prevent a favored few among their number from being granted such special rates and special privileges as made competition with them impossible. Then, their sense of superiority to ordinary rules of heedfulness for the interests of the generality of citizens, made some of the masters of the railroads, either owners or managers, ready at any time to adopt courses of action which caused widespread harm. Being a law unto themselves, they went to war one with another, unregardful of the destructive effects of their wars upon the sections of the country in which these occurred; and with equal unmindfulness of other interests than their own they made peace with each other, often on terms highly detrimental to important portions of the public. The impression created in an observing mind by the railroad magnate of the Eighties may be gathered from the following passage in "The American Commonwealth," by ex-Ambassador Bryce:

"These railway kings are among the greatest men, perhaps I may say are the greatest men, in America. * * * They have more power—that is, more opportunity of making their personal will prevail—than perhaps any one in political life, except the President and the Speaker, who after all hold their positions only for four years and two years, while the railroad monarch may keep his for life. When the master of one of the greatest Western lines travels towards the Pacific on his palace car, his journey is like a royal progress. Gateways of States and Territories bow before him; legislatures receive him in solemn session; cities seek to propitiate him; for has he not the means of making or marring a city's fortunes?"

The early popularity of the railroads was unfavorably affected by another series of operations, under the leadership of such men as Jay Gould, Daniel Drew, Jim Fisk and Commodore Vanderbilt, who were able so to manipulate railroad securities as to produce fabulous profits in weeks or months, to unduly increase the price of some properties, and to ruin others which, if left to their normal transportation functions, would have yielded a reasonable profit to their creditors and owners. Sensational stories of great financial battles filled the newspapers; and the public came to condemn the methods of these railroad manipulators, together with the system which they were supposed to represent; and beyond doubt much that was good in the railroad system suffered along with more that was bad.

The upshot of the whole matter was that a sentiment of distinct hostility to the railroads began to crystalize in the public mind. The former sense of their high usefulness was almost lost in a keen realization of their tremendous unrestricted power. This attitude gave rise, in 1887, to the Act creating the Interstate Commerce Commission, with the establishment of which a new phase of railroad history may be said to have begun. With the entrance of the Commission upon the stage of railroad affairs, an era of expansion gave place to one of restriction. It will be well to examine with some care the Act which brought it into being. The statute is properly known as the "Act to Regulate Commerce." Since its passage in 1887 it has been amended in 1889, 1891, 1895, 1906, 1908, 1909, 1910, 1913, and substantially in 1914, by the Clayton Act. As it now stands, it provides for a board of seven Commissioners, appointed by the President, with the advice and consent of the Senate, for terms of seven years and at salaries of $10,000 a year. Originally there were five members, appointed for six years, with salaries of $7,500 a year. The early conception of the Commission apparently involved a body of investigators constituted on lines similar to those of a departmental bureau. The appointment of its employes was subject to the approval of the Secretary of the Interior; offices and supplies were to be provided by him; and his approval was necessary for payment of vouchers. Subsequent amendments severed all connections with the Interior Department. The tendency of the Commission has been more and more to assume a judicial or quasi-judicial attitude.

The chief purpose of the measure is most clearly stated in the report of the Senate Committee on Interstate Commerce which accompanied the draft of the bill as passed: "The provisions of the bill are based upon the theory that the paramount evil chargeable against the operation of the transportation system of the United States is unjust discrimination between persons, places, commodities or particular descriptions of traffic. The underlying purpose and aim of the measure is the prevention of these discriminations." This purpose was considerably broadened by the numerous amendments which followed, notably the provisions permitting the establishment of maximum rates, in which the original purpose of preventing discrimination is no longer apparent. These accretions of power have been gradual, and perhaps have escaped general attention, at least as to detail. Unquestionably, however, the most complete confirmation of the power and authority of the Interstate Commerce Commission is to be found in the decisions of the United States Supreme Court known as the Shreveport Rate Case and the Inter-Mountain Rate Case. In the Inter-Mountain Case, which was decided on June 22, 1914, the Supreme Court held that the Commission had power, under Section 4 of the Act to Regulate Commerce, commonly known as the Short Haul Clause, to establish rate zones and to indicate the extent to which rates between these

zones might depart from the provision of the statute to the effect that the rate charged for a short haul must not be greater than that charged for a longer haul which includes the short haul, unless upon cause shown to the Commission. In the Shreveport Case, which was decided on June 8, 1914, the Commission was upheld in its control of interstate rates, even to the extent of overriding the authority of a State Railroad Commission in the matter of rates purely intrastate, provided the intrastate rates "injuriously affected, through an unreasonable discrimination, traffic that was interstate." These two cases, and more especially the Shreveport case, establish beyond peradventure the far-reaching and inclusive power of the Commission over railroad rates. And it must be clear that undeniable authority of this sort carries with it an equal measure of responsibility. It is not only true that the Interstate Commerce Commission has complete power to prevent discrimination in railroad rates, and to establish maximum rates, but it is equally true that there can be no question as to the Commission's clear accountability to the country if it refuses to permit the establishment of rates in every sense fair both to the railroads and to the shippers. The power is plenary and the responsibility squarely placed.

Before leaving our discussion of the Commission, it will be worth while to review in some detail the so-called Five Per Cent Rate Case, a rehearing upon which has just been concluded. This case is by far the most important, both by reason of the array of facts it brought out, and the attention it attracted on all sides, which the Commission has so far passed upon. The railroads involved were those in official classification territory, which may be roughly described as bounded by Canada and the Great Lakes on the North, by the Atlantic Ocean on the East, by the Potomac and Ohio rivers on the South, and by the Mississippi River on the West. It appears that the railroads in this territory filed a schedule of increased rates in 1910. This was disallowed by the Commission. In May, 1913, the carriers asked for a reopening of the case on the ground that by reason of the increases in capital charges, in wages, in the cost of fuel and ties, and in taxes, and because of the heavy additional burdens imposed by hours-of-service statutes, extra crew laws, employers' liability acts, elimination of grade crossings, and the installation of various safety devices and appliances, the cost of conducting their transportation service had steadily grown, until the existing rates were insufficient to afford a reasonable compensation to the carriers and a just return upon the property used by them in the service of the public; and that they were also unreasonably low in view of the value of the services rendered. A new set of tariffs was filed on October 15, 1913, and suspended by the Commission. By law the burden is upon the carriers to justify the higher rates.

On July 29, 1914, the Commission found that the net operating revenue of the roads involved was insufficient and should be increased. But the increases asked by the railroads were, in fact, granted only in part. Emphasis was laid upon the possibility of increased efficiency and consequent reduction of expenses on the part of the railroads themselves, and a cheerful view was taken as regards the outlook for railroad prosperity in the future. This language is particularly interesting in its bearing upon the present financial situation. It appears as follows in the Commission's report:

"It was insisted during the hearings that the carriers are facing a crisis and that the need of relief is so urgent as not to permit of the orderly investigation of the possible sources of additional revenue other than by the proposed freight rate increase. The executives admitted the propriety and need of a general readjustment of many of their present rates and practices, and the possibility of further economies and of increased efficiency; but they insisted that grave and serious responsibilities would be incurred if we failed to relieve the situation by at once approving the proposed 5 per cent increase in rates. The principal danger suggested was that the carriers would encounter great difficulty in renewing their maturing short-term notes and other obligations unless investors were assured that the carriers' revenues would be increased immediately. Subsequent developments have shown that there was little foundation for any such view. During the world-wide financial stringency prevailing in 1913 the railroads, in common with States, cities, and the industries, found it difficult to secure loans, however good the security, but with the growing ease in the money markets this difficulty has largely disappeared."

The following paragraph from the report is even more reassuring:

"We may justly feel proud of the development of our transportation system. Despite occasional discreditable chapters the history of our railroads has been marked by great achievements. There is among the carriers a growing spirit of co-operation with the Commission in its efforts to enforce the law. With the application of correct and helpful accounting, the establishment of sound business methods, and a better understanding by both carriers and the public of their mutual obligations, to which we believe this investigation has contributed, the future is full of promise. We see no reason why our American railroads should not enjoy a large measure of prosperity consistently with just and reasonable rates."

In marked contrast to these optimistic expressions, however, were the dissenting opinions of Commissioners McChord and Daniels. Commissioner McChord was content to base his dissent upon the dissimilar treatment accorded by the majority to central freight rates and trunk line rates. Commissioner Daniels concluded a very exhaustive examination of the facts with the following interesting remarks:

"The world-wide phenomenon of rising prices is by this time no novelty. Since 1906 the average rise in the world's price level is estimated by competent statisticians at from 30 to 50 per cent. It has mirrored itself in the rising cost of living; it has evoked and most properly, advances in wages and salaries; it has coincided with an increase in the nominal rate of interest where part of the interest so called is but compensation for the anticipated depreciation of the capital sum later to be repaid. This rise in the price level must eventually be reckoned with in railroading. For a time its effects may be masked by adventitious increases in the volume of traffic, but this temporary relief in its very nature is uncertain, and sooner or later the difficulty is sure to reappear. For a time it may be circumvented by extraordinary economies, but in its nature it is inexorable. It must be faced, not trifled with. It is hardly an adequate remedy to accord to carriers relief only when their returns have reached the well-nigh desperate level now shown in central freight association territory. Even before this inadequate return is evidenced, higher rates are warranted. Such a solution of the present case would have done no less than justice to the carriers and would have promoted the welfare of the community they serve.

"A living wage is as necessary for a railroad as for an individual. A carrier without a sufficient return to cover costs and obtain in addition a margin of profit large enough to attract new capital for extensions and improvements cannot permanently render service commensurate with the needs of the public. Eventually it may come about that railroads will be owned and operated by the Government. That is a matter of public policy which it is not the province of this Commission to consider. But that such a de-

parture from the present policy of private ownership and corporate operation should be materially hastened by the reluctance of new capital to invest in these properties would seem to be a grave indictment of our present system of regulation and control."

The issue, now once more before the Commission, is squarely presented in the opinion of the majority and the dissenting opinion in the Five Per Cent Case. We are now in a position to examine for ourselves into the facts which underlie the railroad situation at the present time.

The railroad mileage of the country and its remarkable and consistent growth have already been referred to. The money investment represented in the system can be appraised with some accuracy. In 1912 the total capital securities outstanding amounted to $19,752,536,264, of which $8,622,400,821 were represented by stock, and $11,130,135,443 by funded debt. The total return during the year, in dividends and interest, amounted to $829,342,042, or 4.18 per cent. The dividends alone were $400,315,313, or 4.64 per cent, and the interest amounted to $429,026,729, or 3.85 per cent. These figures cover the total amount of securities outstanding, whether yielding any return or not. It cannot be denied that these figures indicate a very vast economic movement. In fact, next to the value of the land itself and the improvements thereon, the railroads and their equipment represent the greatest value of any division of our national wealth, amounting to more than one-tenth of the total value of all property in the United States, as estimated by the Census Bureau. In 1912 there were in the hands of the public in the United States $15,087,600,650 of the capital securities of American railroads.

This capitalization is less per mile than that of any other country. The capitalization of six representative foreign systems, per mile of road, in round figures, and in comparison with that of the American system, will be seen from the following table:

RAILROAD CAPITALIZATION PER MILE OF ROAD, 1912.

United Kingdom	$275,000	Germany	$110,000
Belgium	170,000	Russia	80,000
France	140,000	United States	58,000
Austria	112,000		

The total capitalization of the railroads of the United States shows a large increase each year, rendered necessary by the fact that surplus revenue does not afford a sum sufficient to keep the plant up to a point of efficiency in face of the steadily increasing traffic demands. In 1912 the increase in par value of railroad securities outstanding in this country over the previous year was $543,601,183. This amount is in no way out of the ordinary. The demands of the current year are at least as great. That traffic requirements are keeping well ahead of the facilities of the railroads to meet them was pointed out by Mr. James J. Hill in an address reprinted in this paper in 1913. Mr. Hill cited the following table:

GROWTH OF TRAFFIC AND TRANSPORTATION IN THE UNITED STATES, 1895 TO 1910.

	Increases Per Cent—		
	1895 to 1905.	1905 to 1910.	1909 to 1910.
Mileage	21	11	1.5
Locomotives	35	22	3
Passenger cars	23	16	3.3
Freight service cars	45	23	3
Passenger mileage	95	36	11.
Freight ton mileage	118	37	16.6

"This ratio," said Mr. Hill, "will be subject to increase rather than decrease. If any manufacturer were confronted with such conditions, it would be clear to him that he must either refuse business or more than double his plant. The railroad cannot refuse business. If it could do so legally, that policy would still mean National panic and individual ruin. It must enlarge its plant."

Mr. Hill added that the crying need was not only for more cars but for greater movement of cars. The freight tonnage hauled in 1910 on a basis of 21.5 tons per car, would take 86,041,865 cars to carry it. This would mean 7,858 cars per day in each of thirty important terminals, on the basis of one car passing through one terminal only, and but once a year. It is admitted that 5,000 cars a day would blockade many of our large terminals. The worst traffic troubles at the present time, therefore, arise not so much from insufficiency of rolling stock or inefficiency in handling it, as from congested terminals. The remedy can come only through better terminal facilities. And these, of course, are a matter of money. Further, in addition to rolling stock and terminal needs, there are increasing requirements for improved train facilities. Steel cars are supplanting wooden cars; heavy rails are taking the place of light ones.

"Grade crossings," Mr. Hill continued, "must be eliminated in both the cities and the country. The ordering of these is held to be a legitimate part of the police power of the State, whose exercise is unlimited. To raise or lower tracks at a single city may cost millions of dollars. This class of expenses grows very rapidly in the United States as population becomes denser. Shall we capitalize them also, as has been done abroad? Safety appliances must be adopted. Ingenuity is adding yearly to the number of these; and the public demands rightly that they be put into use as soon as their value is demonstrated. But all these things take money—and a lot of it."

Probably no one will dispute the fact that new capital is needed. The urgency appears more apparent, however, upon an examination of the constantly increasing demands upon railroad gross revenue, and the consequent decrease not only in surplus to be applied to maintenance, but also in adequacy of interest and dividends, which is the final consideration in attracting the new capital required. In the period from 1905 to 1912 the par value of capital securities outstanding increased 50.8 per cent. During the same period the number of passengers carried annually increased from 492,430,865 to 1,004,081,346, or over 100 per cent, and the number of tons of freight increased from 631,740,736 in 1905 to 1,844,977,673 in 1912, or nearly 200 per cent.

In the usual industrial system, an increase of patronage such as is indicated by these figures could mean only a high degree of prosperity. The case of the railroads is different. The public has demanded greater comforts, and even luxuries, in the way of transportation facilities, but the rates have not been permitted to increase proportionately. As a result, the passenger service as a whole has, for a number of years, been run at a net loss. The main difficulty of the railroads with regard to revenue, however, is in the matter of freight rates. This will become evident from a statement of the comparative returns from freight and passenger traffic. In the figures covering gross earnings from railroad operation in 1910, as given by the Interstate Commerce Commission, passenger traffic earnings were just under $629,000,000, whereas freight revenue amounted to over $1,925,000,000. Consequently, the railroad must ultimately stand or fall upon its freight record, with its complicated problems arising out of the variation in kinds of freight carried, whether grain, hard or soft coal, lumber, ore, fruit, or cotton, in the degree of competition, the nature of the markets reached, and the possibility of fluctuations in traffic or rates, due to dull times. It is interesting, therefore, to note that the annual receipts of all the railroads of the country per ton mile of freight were .766 in 1905, and .744 cents in 1912, the average being .755 for the eight-year period. It may be stated parentheti-

cally that freight rates in the United States are the lowest in the world.

Turning next to the matter of fixed charges, it appears that railroad wages, for example, increased between 1905 and 1912, from $839,944,680 per annum, to $1,252,347,697 per annum, an increase of 52.0 per cent. During the same period the annual railroad outlay for taxes advanced from $63,474,679 in 1905, to $120,091,534 in 1912, an increase of 89.1 per cent. The ratio of operating expenses to operating revenues increased from 66.7 per cent in 1905 to 69.3 per cent in 1912. The net revenue during the last three years of the period mentioned shows a striking decline. It was $928,432,997 in 1910, $874,707,664 in 1911, and $870,279,606 in 1912. The thirty-five railroads which have petitioned for increased rates showed a decrease in net operating income for the year ended June 30, 1914, as compared with the previous year, of 21 per cent. In the new petition to the Commission the brief of the railroads asserts:

"That when the new tariffs of October, 1913, were denied, there were available for the Commission the annual reports for the year ended June 30, 1913, and the monthly statements up to and including May, 1914. Since that time the complete income accounts for the fiscal year ended last June have become available. These annual reports show a decrease in total operating revenues of approximately $45,000,000 for the thirty-five systems, while during that same period operating costs have increased by $23,300,000. After deduction of taxes and deficit in outside operations, there was a decrease in operating income of approximately $73,700,000, notwithstanding the increased property investment. So that the tendency toward a diminishing operating income, found by the Commission in its report, is emphasized by the figures covering the complete year to June 30, 1914, while the reports for July and August, 1914, show a continuance of this declining tendency, notwithstanding extraordinary efforts made to reduce expenses."

From a business point of view, the most natural conclusion which can be drawn from these figures is that the railroads will have difficulty in obtaining $500,000,000 of new capital to meet their needs during the ensuing year. Such a conclusion is in line with the economic theory of investment, which President Hadley, as chairman of the Railroad Securities Commission, summed up in the following language:

"Where the future is uncertain the investor demands, and is justified in demanding, a chance of added profit to compensate for his risk. We cannot secure the immense amount of capital needed unless we make profits and risks commensurate. If rates are going to be reduced whenever dividends exceed current rates of interest, investors will seek other fields where the hazard is less or the opportunity greater. In no event can we expect railroads to be developed merely to pay their owners such a return as they could have obtained by the purchase of investment securities which do not involve the hazards of construction or the risks of operation." Such a conclusion upon the facts presented would appear to be in accord with at least one representative section of applied investment opinion. In a recent statement in the New York "Times" the investments of national banks as reported to the Comptroller of the Currency are analyzed. It appears that between 1911 and 1913 the investments of national banks in municipal securities increased by $40,000,000, to the sum of $1,240,000,000, an increase of 3 per cent; investments in public utility securities increased by $171,100,000, to $721,300,000, or 31 per cent; while in those two years their investments in railroad securities decreased by $71,900,000 to $1,530,200,000, or nearly 4.5 per cent.

This is no new development. In fact, it is important, in view of the limited scope of the case now pending before the Commission, to note that the present critical railroad situation was prior in origin to the outbreak of the European War. This should be borne in mind because, logically, if increases are now to be granted wholly on the ground of a temporary urgency, they may be promptly withdrawn when the crisis is past. Moreover, a recognition of this distinction bears directly upon the present discussion because it appears somewhat in the nature of a limitation upon the completeness of the recognition by President Wilson, in the letter referred to above, of the need of positive and definite action to strengthen the position of the railroads. The President here, as in the words previously quoted, recognizes the importance of the railroads, but appears to incline to the view that their very indispensability will go far in itself toward solving their difficulties, if, indeed, any difficulties exist beyond the present temporary embarrassment. The President's words are as follows:

"I cannot say that I entertain any deep anxiety about the matter, except, of course, the general anxiety caused by the unprecedented situation of the money markets of the world, because the interest of the producer, the shipper, the merchant, the investor, the financier and the whole public, in the proper maintenance and complete efficiency of the railways is too manifest. They are indispensable to our whole economic life, and railway securities are at the very heart of most investments, large and small, public and private, by individuals and by institutions."

But here again, it is of first importance to point out the essential note in the President's words. It may be true that he has interested himself in the difficulties of the railways solely on the ground that a temporary crisis exists. But even so, the chief point to be noted is that he has interested himself, and that he has expressed his interest in language which, in its recognition of the railroads' position in our economic life, goes far beyond any temporary insufficiency of funds. As to the existence of an emergency at this time the President's opinion is rendered clear in the concluding words of his letter:

"The emergency is, in fact, extraordinary, and where there is a manifest common interest we ought all of us to speak out in its behalf, and I am glad to join with you in calling attention to it. This is the time for all to stand together in united effort to comprehend every interest and serve and sustain it in every legitimate way.

"The laws must speak plainly and effectively against whatever is wrong or against the public interest, and these laws must be observed; for the rest, and within the sphere of legitimate enterprise, we must all stand as one to see justice done and all fair assistance rendered, and rendered ungrudgingly."

Before leaving the question as to whether our railroad problem is one of recent growth, or one of long standing in the country, it may not be uninteresting to quote a passage from "The American Commonwealth," written nearly twenty-five years ago. It is as follows:

"It may therefore be conjectured that the railroad will long stand forth as a great and perplexing force in the economico-political life of the United States. It cannot be left to itself—the most extreme advocate of *laissez faire* would not contend for that, for to leave it to itself would be to make it a tyrant. It cannot be absorbed and worked by the National Government;—only the most sanguine state socialist would propose to impose so terrible a strain on the virtue of American politicians, and so seriously to disturb the constitutional balance between the States and the Federal authority. Many experiments may be needed before the true mean course between these extremes is discovered."

Possibly, the future may reveal the fact that the mean course between the extremes, to which Lord Bryce referred, has been discovered in the present system of regulation, through the instru-

mentality of the Interstate Commerce Commission. It is assuredly not yet possible to declare the system, as so far applied, a failure. For the friend of the railroads who feels that too great severity has been practiced against them must, in justice, bear in mind the circumstances in which the Commission had its genesis; then again, if he would regard the case fairly, he must remember that two most unsavory scandals in railroad management, one in the East and one in the West, are still fresh in the public mind. In formulating a course of action with regard to the railroads as a whole the Interstate Commerce Commission is surely within its legal right and, indeed, its legal duty, in withholding the relief demanded until, on all the facts, such relief appears proper for railroads, shippers and public alike.

At the same time, if any conclusion can be drawn from a review of railroad history, it is that no system of regulation, by itself, can put the railroads in a position to meet the future needs of the country; vitality must exist within the system itself, and cannot be imposed from without. If the creative spirit of the pioneers, shorn of its excesses, is not permitted to remain, the evolution from an era of expansion into one of regulation must lead naturally into an era of destruction—or the inevitable alternative, government ownership.

With this truth in mind it cannot fail to be a source of gratification to all who have the best interests of the country at heart to observe on the part of the public, and of the men who represent the best in public opinion, a tendency to depart from an extreme critical attitude toward the railroads, and to accord them, as "the one common interest of our industrial life," a critical yet sympathetic co-operation. Of this tendency the letter of President Wilson is the most noteworthy example.

AS yet the Interstate Commerce Commission has not handed down its decision in the matter of the Five Per Cent Rate Increase for the railroads of Trunk Line and Central Freight Association territory, the rehearing of which began nearly a month ago. Naturally, there is no intimation as to what the character of the decision will be, unless it be assumed that the point of view of the Commission throughout has been that of Commissioner Clements, as indicated by his reiterated asking of witnesses, during the hearings, whether the railroads are entitled to relief, in respect of the effects of the European War, which is denied to other industries. Mr. Brandeis also,—a self-constituted advocate of the users of the railroad, who has long been decidedly *persona grata* with the Commission,—made much of the same implied contention in his final argument in opposition to the petition of the railroads, declaring that it would be wholly wrong for the Commission to permit the shifting of the burden of the war, which is common to everybody, completely off the shoulders of railroad stockholders over upon those of the general public. The active Mr. Thorne, too,—redoubtable Iowan opponent of the railroads and all their works,—reasoned similarly, even if not in set terms. The members of the Commission other than Mr. Clements, however, if we may judge from the reports of the hearings, gave slight sign of the conclusions to which they were coming; and it is by no means certain that a majority of them concur with their colleague. The event may well prove that they, like President Wilson, have been sufficiently impressed, not only by the financial and economic testimony presented to them, but also by the obvious change of public opinion regarding the railroads (for politics unhappily enters here), to cause them to cease from their policy, now become almost traditional, of resisting or evading obvious necessity, and to concede that which every consideration of prudent business and of national advantage requires. Certainly this will be the case, if the majority of the Commissioners are "forward-looking" men and if they reach their decision in the light of larger wisdom rather than with their minds befogged by inconsequential particulars.

It appears to us to be a manifest fact that the case of the railroads is, so to speak, "getting away" from the Interstate Commerce Commission. Ingenious as their decisions have been of late years in arraying plausible reasons for their course, that course began, at least as early as two years ago, to meet with only half-hearted approval from the thinking part of the American public; and more recently no small part of this public has ceased to approve at all, having become more and more impatient with the Commission's apparent lack of ability to determine great matters upon those grounds of the larger good of the community, which keep questions of detail, perhaps deserving attention yet relatively insignificant, in proper subordination to the main issue. We do not think, for example, that the informed public was pleased or satisfied by either the method or the manner of the previous determination of this very case of the Five Per Cent Rate Increase. It had been borne in upon the public mind, not by reason of the arguments of railroad officials but because of the great aggregate of financial and economic facts about railroads which it could see for itself, that the time had come for one of those root and branch decisions which the great leaders of business must from time to time make at a stroke, because of a perilous juncture which has come about. It was a time for disregarding detail, postponing it to a more appropriate and convenient occasion. But the Interstate Commerce Commission dwelt only upon detail, turning it this way and that, endeavoring to confine it into a coherent whole, allowing it to obtrude itself as the main matter; and in consequence the real question was not considered or passed upon, except feebly and ineffectively, although the Commission's decision had the practical effect of determining it for the time being. The intelligent public, we believe, saw this; and, as has been said above, it was not pleased. More than this, it was decidedly irritated at having the Commission put forward a variety of mere expedients, whose adoption by the railroads was held out as a sufficient solution of their difficulties, when it was obvious at a glance that many of these expedients were intended to produce by indirection the results which the occasion directly demanded, i. e. an increase of the revenue of the roads. The public perceived quickly and clearly enough that the Commission's suggestions to the railroads that they should get the necessary additional revenue through doing away with free or insufficiently remunerated services, like "spotting" freight cars, absorbing lighterage and similar charges, making improvident divisions of rates with plant railways, etc., displayed a sole concern with the old problems of discrimination between shippers and evidenced almost complete blindness to the great movement of economic and financial forces which is the true cause of the embarrassed situation of the railroads. What the public desired of the Commission was a just assessment of these economic and financial forces, as affecting the efficiency and continued development of the railroads, a sound and wise determination of what these forces make necessary, and courageous putting of this determination into effect by means of a decision completely free from quibbling and shuffling, but going straight to the heart of the matter. None of these things, however, did the public get from the Commission, notwithstanding the slight concessions to the railroads in Central Freight

Association territory in respect of freight rates and the vague hint that something might well be done by the railroads to make their passenger service show a profit, instead of a loss.

More than two years ago, Professor E. Z. Ripley, of Harvard University, than whom no more competent and disinterested student of railroads in this and other countries can be found, at a dinner of the Economic Society of New York devoted to the discussion of the then hoped-for still larger increase of freight rates, declared that no observer whose opinion was of value doubted that the railroads of the United States "must be permitted to earn more money." Their situation, he asserted, was even then too serious to be disregarded; and without an addition to their income they could not maintain their efficiency,—much less develop and improve their service, as the public desires and indeed insists that they should do. This statement of Professor Ripley brought out in sharp relief the fundamental matter which the thinking public, then somewhat tentatively and vaguely but now clearly and decisively, has expected the Interstate Commerce Commission to deal with in the present and in the previous rate increase cases. And this public is exasperated at having questions of a subsidiary character,—deserving attention no doubt, but impertinent to the consideration of the primary problem,—mixed up with the Commission's discussion of that primary problem. If there are discriminatory practices in connection with the "spotting" of freight cars, for example, of course the Commission should at the proper time investigate them and cause them to be discontinued. It is probable, too, that doing away with them would improve the revenues of the railroads, just as abolishing passenger passes a decade ago, added to those revenues. But nobody who thinks justly believes that savings of this kind are adequate for the attainment of the necessary end, which is the proper readjustment of the revenues of the railroads to the changed economic and financial conditions which the railroads are obliged to meet. The asseverations of Mr. Brandeis and Mr. Thorne to this effect are received generally with the same incredulity as were Mr. Brandeis' extraordinary estimates given to the Commission in 1912, of the savings to be derived by the railroads from greater efficiency of operation.

The great movement of economic and financial forces to which allusion has been made above takes the form, on the one side, of an irresistible rise in the prices of commodities and labor, and, on the other, of an equally irresistible rise in the rent, or interest rate, of capital. Whatever the causes of this movement, whether a redundant gold supply, as Professor Irving Fisher would have us think, or an effective demand for commodities, labor and capital more universal and insistent than has ever before been manifested in the world's history, every person having any acquaintance with economic phenomena knows that the movement is a reality of world-wide manifestation, and that not to acknowledge its existence and implications is the height of economic and financial unreason. More than this, it is now a self evident fact that as regards the price of capital we are destined to see a still greater enhancement of it, until all current ideas about it will be confounded. The European War, with its necessary train of enormous national debts, insures this. To try to stand in the way of this enhancement is as foolish as to attempt to hold back the flowing tide. Every business man, in all his calculations for the coming years, must calculate that if he is to hire capital he will have to pay for it a price unheard-of in recent years, and that if he is fortunate enough to be the owner of capital he can sell the use of it at a correspondingly high rate. In the case of the railroads this is not a theory but a condition that confronts them. It is an entirely conservative assertion that the average rate of interest or dividends which American railroads must pay for all the capital they will require during the next quarter of a century will be above 5 per cent, and that the probability that 6 per cent rather than 5 per cent will be the approximate average is so preponderant that the plainest business prudence requires 6 per cent to be assumed as certain by all those having to do with our railroads. And it must be borne in mind that this high rate will not be confined to the new capital which the railroads must raise; it will gradually come into effect for the greater part of the capital they already have invested in them. The old bond issues whose interest rate is low will be continually maturing and must be refunded into new issues at the new rate of interest. Short-term notes, whose aggregate is now an appreciable part of the entire railroad capital of the country, must be before long replaced by bonds at the current interest rate. And even railroad stocks, in so far as capital has been or is attempted to be raised in this way, must hold out the promise of a return to the holders equivalent, first to this high basic market value of capital, and, second, to the increment of remuneration which participators in the business risk are entitled to and can obtain.

It is a condition precedent to the provision by our railroads of the service which the country requires of them, that they should be incessantly enlarging and developing, hiring or otherwise obtaining new capital and investing it in their properties, reaching out in new directions with all their facilites, continually devising and providing new means of usefulness. The mere increase of the population and of the business of the country would in any case make this necessary; but there is a further reason, inherent in the deep springs of all human activity. It does not lie in human nature for men, (and railroads after all must be operated by men), to be genuinely efficient and serviceable in businesses which no longer progress, which have reached their ultimate development and afford no prospects of still greater successes in the future. If we are to get from that nearly 10 per cent of the population of the United States which passes its life in the work of railroads, the maximum of useful service for the other 90 per cent of the population, there must be no staying of the creative and constructive activities of the railroads. But the *sine qua non* of the continuance of these creative and constructive activities is capital and then more capital. The hard fact has to be faced, however, that the use of capital must be bought in the open market, and that human wit has not yet discovered a way of buying it at less than the market price.

If the Interstate Commerce Commission will put aside old controversies, the inconsequent particulars of temporary issues and the idle discussion of insignificant rights and wrongs, and will look only at these great primary facts, it will be able to get beyond the norm that the criteria of its action are whether this "does justice" to the shipping public, allows a "reasonable return" to the capital actually invested in the railroads as determined by some theoretical and still unascertained appraisement, or shifts a burden of temporary loss this way or that. All these matters, of

course, have their due time and place; but in the affairs of men there are occasions when great determinations must be made, not upon the basis of a sum of details, but upon the grounds of transcendent changes in the whole posture of things throughout the world. This is, in our opinion, such an occasion; and the Interstate Commerce Commission will itself be judged by the capacity it shows to recognize this fact and act upon it. *Arthur Richmond Marsh*

STATE BANKING INSTITUTIONS UNDER THE FEDERAL RESERVE ACT

By Dr. H. Parker Willis*
Secretary of the Federal Reserve Board

THE subject assigned me for this meeting is "The Future of State Institutions Under the Federal Reserve Act." The subject is a broad one, because the theory of the Federal Reserve Act is that there should be a union of all banking institutions. Instead of confining the operation of the law to National banks, as was at first proposed by some thinkers, its scope was finally enlarged, so that to-day almost any institution may become affiliated with the Federal Reserve system by complying with the provisions applicable to it. The legislation, as it has developed, aims to create a means of unifying the reserves of the whole nation, in order that the whole banking system may be strengthened, where it is weak, by reliance upon the aid of the stronger portions of the country when need may be; while those parts of the nation which may have excess funds are enabled to employ them profitably by placing them at the disposal of other portions of the country, for investment in the paper which may offer itself.

In another great and important way the Federal Reserve Act, as now framed, contemplates the inclusion within its range of as many of the banking institutions of the country as can be induced to participate. I refer to the question of domestic exchange. The Act provides for unifying domestic exchange methods. Such unification calls for the aid of all the banks of the country, if it is to be thoroughly successful and practical. Both as regards the attainment of genuine banking strength, therefore, and as regards uniformity of domestic exchange rates, the Federal Reserve Act distinctly contemplates and desires the inclusion of all institutions within its scope in the way that I have just indicated. I might go further and suggest a variety of considerations bearing upon this subject and showing the reasons why and the ways in which such affiliation is contemplated by the law. In the short time at my disposal, however, it will not be possible to cover the whole ground, and I shall have to confine myself to a few of the more important aspects of the subject.

Assuming, (what is evident from the Act and from all that has been said), that State institutions are freely welcomed to the Federal Reserve System, and assuming further that, as I have just intimated, the system cannot attain its full fruition and success unless the great majority of the banks of the country are gathered into it, let us consider the practical question presented to the State banks of the country.

First of all, what is there to prevent State banks from entering the Federal Reserve System? The Act provides that every such bank shall comply with the requirements that are imposed upon National banks with regard to capitalization in relation to population, and in regard to the amount of reserves maintained. Such State banks must, moreover, conduct themselves in a general way on the basis of banking management that is laid down for National institutions under the Federal Reserve Law, although it may be said in passing that there is nothing in that law to interfere with those banks which are organized under State law, or to prevent them from taking advantage of those broader provisions of legislation which are found on the statute books of some States. But, in a general way, State banks which enter the Federal Reserve System must live up to certain requirements as to capital and reserves, and must submit to examination on the same basis as the National members of the system. How does this affect the State banks?

It is undoubtedly true that in some States the standards set by law on the three points I have just mentioned are lower than those of the Federal Reserve System. We cannot, however, get a fair test of the case by merely noting that there is a difference between State and National legislation in this regard. The real question is not whether there is a difference,—that is to say, whether a State bank can if it chooses get down to a lower basis of management than that prescribed by the National law,—but whether the basis prescribed by National law is unduly high or severe. I do not think that a consideration of the terms of the law will lead any one to think so. As is well known, the Federal Reserve Act, during the later stages of its development in Congress, was modified in the sections relating to reserves so that, as the thing stands, a bank in a central reserve city is merely obliged to keep 18 per cent of its demand deposits and 5 per cent of its time deposits,—one-third of the said 18 per cent to be in its vaults in cash, seven-eighteenths in the Federal Reserve Bank, and the balance either in its own vaults or in the Federal Reserve Bank. A bank in a reserve city has to hold 15 per cent of the aggregate amount of its demand deposits and 5 per cent of its time deposits,—it being necessary that one-third of the 15 per cent referred to shall be held in cash in its own vaults, while six-fifteenths, or two-fifths, are placed in the Federal Reserve Bank of its district, the remainder being optional. In country banks it is necessary that a 12 per cent reserve shall be maintained against demand deposits, with 5 per cent against time deposits, while of this 12 per cent only one-third, or four-twelfths, is ultimately to be carried in cash, and in the Federal Reserve Bank five-twelfths, the balance being optional as between the bank's own vaults and the Federal Reserve Bank.

Comparison of these figures with reserve requirements in the several States would be interesting, but time will not permit me to present a complete tabular view of the situation. Suffice it to say, therefore, that the reserves mentioned in the Act are not as great as those which are required of banks in the States whose laws have been best framed and are best executed. We must, therefore, reach the conclusion that the reserve requirements of the new system are not such as should prevent any bank from entering it. If legislation which is now pending before Congress should be put into effect by the Board, these reserve requirements would be made even lighter than those contained in the Federal Reserve Act itself.

What I have just said may be considered as bearing primarily upon the case of a State bank which is just organizing, has not become involved in any business transactions or complications, and is considering for the first time the question whether it shall affiliate itself with the Federal Reserve System or not. But, as a practical matter of fact, such banks are few in number. The question must be discussed from the standpoint of the State banks which have been in existence for years past, and which are active, going concerns, their funds involved in various transactions, and their credit committed to the support of various enterprises. What of such institutions? In a general way, I may say that it has been

*An address delivered before the American Bankers' Convention, Richmond, Va.

found that the two principal obstacles to the entry of such State institutions into the Federal Reserve System are as follows:

(1) The existence of a large element of real estate loans in the portfolios of the institutions;

(2) The existence of what are called "excessive loans," by which is meant loans to single persons or individuals, greater than the amount permitted under the National Banking Law.

It has been rightly assumed by the State institutions that they ought to eliminate these two grounds of criticism, if they expect to enter the system. A good many have suggested that they be given a reasonable amount of time to comply with the requirements of the system, it being recommended that such time should include a period ranging from six months to three years. It is probable that a good many institutions could, if they chose, get ready to enter in much less than a year, while there are others that could not successfully prepare themselves without having a much longer period than that.

Some able bankers have told me that, if they were given a very reasonable extension of time within which to bring their assets into conformity with the requirements of the National Law and of the Federal Reserve Act, there would be no doubt that they would enter the system in large numbers, either at once or as soon as the new banks are placed in practical operation. Whether they would do so or not, is, of course, simply a matter of opinion; but in the absence of definite information on the subject, it may be assumed that they would do so, since this is manifestly the view of many able State bankers who are entirely independent of one another and who come from sections of the country so widely separated that it cannot be assumed that they have merely taken their ideas from one another.

If it be supposed that the opinion thus expressed is approximately correct, then the question arises whether the Federal Reserve Board has the right to, or having the right ought to, grant the concession that is called for. The Board has taken no action on this matter, and no one can or ought to try to predict what is likely to be done. Exactly how far its powers would permit it to go may be an open question. Without seeking to pass upon questions which are still *sub judice*, it can only be stated, therefore, that all thoughtful men, studious of the interests of the banking community and of the Reserve System, do undoubtedly desire to see a large number of State banks included in the list of member institutions. Personally, it is my very strong hope and belief that a large number of them will be thus brought in, and under conditions which they can reasonably be expected to submit to during the transition period.

It will be observed, however, that all that has been said thus far has been based upon the assumption that the banks thus seeking to enter the system are banks of the same general kind or description as those which constitute the rank and file of the member banks to-day. That is to say, it is assumed that they are commercial banks. On even that point I think there is some confusion of thought in some parts of the country, and possibly among certain groups of bankers elsewhere.

The Federal Reserve System is essentially intended as a commercial banking system. It is therefore not desirable that any bank should enter the system unless it is doing or intends to do a commercial business. All those institutions which are engaged in operations that render it unnecessary or undesirable for them to comply with the commercial requirements, are, *ipso facto*, outside the range of banks that will be much benefited by membership. Although, technically speaking, every State banking institution willing to comply with the law may become a member of the Federal Reserve System, it is not desirable that those should do so whose business is essentially of a different type from that of the commercial banks of the country and which are, consequently, either forced to make a sacrifice, thereby subjecting their customers to discomfort or inconvenience in order to come in, or which are in some other way subjected to difficulty as a result of it. In a word, no State institution ought to think of entering the Federal Reserve System unless its business is of a distinctly commercial type. Granted that, there is every reason why it should come in; but granting that its business is of a different type, the case changes.

It seems to have been supposed by some banks that they must enter the Federal Reserve System in order to get the benefit of it. That is only partially true. If the Federal Reserve System attains the objects for which it is intended, it will do so because of the fact that it modifies the whole banking situation. It will provide a market for commercial paper, and it will tend to bring discount rates to a degree of uniformity that has never before been possible. When the conditions are such throughout the country that commercial paper of known value can be marketed, and when, through the development of the principle of combined reserves, panic dangers are largely eliminated, every institution, whether a member of the Reserve System or not, will get the benefit of the improved situation. Of course, this result cannot be reached unless a sufficient number of commercial banks are joined together in the system. Enough are already members practically to insure this state of things, but the assurance will become more and more distinct as more and more of the commercial banks join. Should they all enter, the system will gain no additional strength by the incorporation of members whose business is of a primarily investment character, even though they technically comply with the reserve requirements. Neither will the institutions themselves profit particularly by such membership. They will get the advantages of the system in any case by being enabled to borrow under more favorable conditions from the member banks which have rendered their own assets more liquid through their own membership in the system, and have thereby enabled themselves readily and regularly to afford such aid as may be asked for by their banking customers. When we hear the statement, therefore, that it is to be hoped that all institutions will ultimately become members of the Federal Reserve System, the wish must be regarded as based on enthusiasm, rather than on knowledge.

In what I have said thus far I have merely outlined the conditions as I think they must appear to a business man. But your Committee has also asked me to consider the probabilities of the future. This leads into the realm of prophecy, and I am thoroughly aware of the dangers it involves. It is, however, possible to express a few opinions in regard to the general situation. At the present time, a moderate number of State institutions of all kinds have affiliated themselves with the system, including both banks and trust companies. Without giving exact figures it is fair to say that thus far only a very small percentage of State institutions has seen fit to join. Two questions arise in this connection: the one, why more have not joined; the other, whether more will join in the near future. Many persons regard the smallness of the number of State institutions that have already joined as indicating that the system does not appeal to State banks. I have already indicated some reasons for thinking that this should not be the case, and, in fact, for believing that it is not. It may be inquired: What then is the reason why so few State institutions have become members? In general, my answer to this would be that the State institutions have not joined, simply because they did not have to do so. The banker, above all other men, is a conservative. His func-

tion is that of supplying conservatism in business. He insures credit; he guarantees that other men's judgments are more or less correct. If left to himself, he will move slowly and look before he leaps, and his mistakes will be those which grow out of adherence to routine, rather than those which are due to rashness, haste and desire for change. A good many State bankers, who have not had the compelling motive for coming into the system at once that was felt by the National banks, have therefore waited to see how the situation would develop. As nearly as I understand, many are now on the margin of doubt. If conditions open favorably, they will naturally be attracted into the system in considerable numbers; if the reverse, they will probably prolong their period of waiting. Believing as I do that the Federal Reserve System will be made to operate successfully from the start, my disposition is to think that there will, at an early date, be many new members who will come from among the State banks, and that they will join within a comparatively short time after the Reserve Banks are actually open. Assuming, however, that such should not prove to be the case, and that no rapid movement of State institutions into the system occurs—what then?

It is probable that State bankers who have what to them seems a good reason for postponement of action, will continue to find such reasons for some time to come and will not bestir themselves to join the system until a very distinct fresh motive is afforded to them for so doing. What will that motive be? It seems to me that the motive is hardly likely to be found in the mere lack of opportunities for rediscount. If the rediscount plan operates as it is expected to, State banks will get the benefit of it indirectly, by finding themselves able to dispose of their paper on favorable terms in the open market, without necessarily going to a Federal Reserve Bank for their accommodation. It is rather to be expected that the motive tending to lead State bankers to enter the system will be found in the clearing function. If the clearance provision in the Federal Reserve Act proves successful, it may be expected that business will be transferred to the member banks by those who will appreciate the immense advantage open to them as a result of the provisions freeing them from the oppressive conditions to which they have been subjected in regard to domestic exchange. It will be imperative for State banks to place themselves upon as good a foundation for appealing to the public in this regard as that upon which the member banks rest. We may say, therefore, that the early entry of State banks into the system depends in a very large measure on the way in which the clearance feature is handled and on the extent to which the clearing function is taken over by the Federal Reserve Banks, under instructions from the Federal Reserve Board. Provided that this work is undertaken courageously and successfully, the result will be to enlarge very greatly the membership of the Federal Reserve System. This opinion I advance simply as a personal opinion and under the restrictions and limitations already outlined. I do not pretend to foresee or predict the future; I analyze only the situation as it appears to me to-day.

Another question of longer range, and of equally great moment, is this: Will the Federal Reserve System tend to enlarge the National system of banking, or to limit it? In other words, will the future of State institutions under the Federal Reserve Act be a future of gradual conversion into National banks, or will the State institutions find their ranks gradually enlarging until ultimately the banking system of the United States consists of a body of banks organized under State law and federated together in twelve Federal Reserve institutions, the National banks being either extinct or on the road to extinction? In much of the banking discussion of the past two or three years, it has been stated that the drift of things was toward the elimination of the National bank. This was on the ground that, with the bond basis for currency issue definitely removed, there would be no particular reason why a National bank should exist; while with the privilege of membership in the Federal Reserve System open to State banks, it would be largely a matter of indifference under which system an institution might organize. At times it has seemed to me that those who thus argued had a rather substantial basis for their predictions. And yet since the adoption of the Federal Reserve Act, the National system has grown rapidly. During that time there have been organized about 164 National banks. And this rate of growth is essentially the same as in recent years. There seems to be little disposition on the part of already established banks to leave the system, but, on the contrary, the process of new organization continues as I have noted. It may be inquired whether this is not due to the fact that long experience has not been had with the new system, so that men naturally tend to follow in the groove marked out by custom, even though there are factors working against that course. Were this question to be answered in the affirmative, we should have to conclude that the probable relation between National and State banks under the Federal Reserve System and the relative growth of the two groups would be a matter for future determination, as to which no positive opinion could be expressed to-day. To some extent this is undoubtedly the situation. Some States have already been making vigorous efforts to hold their own banks under State law. An example is seen in the case of the State of New York, which has recently liberalized its Banking Act, shaping a piece of legislation which some believe is more favorable to satisfactory banking than the National Act, as modified by the Federal Reserve Act. Observe, however, that this action has been taken in order to prevent State banks from converting themselves to National banks. The problem before us just now is the converse of that, and is, whether there will be a drift of National institutions into the State system. It would seem that there is good ground for believing that, as a result of banking discussion and largely in consequence of the unifying influence of the Federal Reserve System, there will be a much stronger drift than heretofore toward standardization of bank examinations and of banking legislation. The Federal Reserve Act will have a very powerful influence in bringing about uniformity of conditions in examining banks and in controlling them generally. If such uniformity be rightly developed, may it not be supposed that banks already holding either a State or a National charter will continue as they are now? May it not also be assumed that, there being less variation of the conditions under which the two systems are operated, the choice whether to enter a State or the National system will be of relatively trifling importance, so that banks will enter one or the other in very much the same ratio as at present, or perhaps in substantially proportionate numbers?

It seems to me that this is the direction in which conditions are drifting, looking at the matter from a long-range standpoint. So long as the State banks are allowed to become members of the Federal Feserve System, and so long as the effort to standardize National and State banking legislation is in progress, I do not see why one set of conditions should not offset the other, and each system continue fairly well to hold its own. But in all this, of course, it is recognized that we are speaking of the future; nothing positive can be said, and no one can reasonably dogmatize about the probable outcome. Conditions may suddenly change, as they have in the past; and if they do a new and unexpected drift may at any time be given to the course of banking development.

From what has been said, you will see that I am not inclined to speak very confidently or positively of the future, on any of the points under discussion. In fact, the present is of more import-

ance than the future, because what happens later is the direct outgrowth of what is done to-day. For the present the problem is perfectly clear. It is, from the standpoint of the Federal Reserve System, to extend its borders as widely as it legitimately can among commercial institutions, bearing in mind and having due regard to the requirements of commercial banking, and always with the desire to take in only sound and well-managed institutions, as well as those whose business is of a type that conforms substantially with the provisions of the law. From the standpoint of the banks, it will evidently be worth while for State institutions to conform to the reasonable requirements of the Federal Reserve Act in the matter of capital, reserves and examination, if by so doing they can get any real or substantial advantages for themselves. That they can get such advantages, not merely in rediscounts, but also in clearing their items and in performing various other banking operations, and that they can materially advantage themselves and their customers by becoming members of the Federal Reserve System, is, I am sure, the general belief of those who are most familiar with National and State laws. Uniformity of management, simplicity in domestic exchange, ability to bring aid to those institutions or sections where aid is needed, and to afford opportunities for fluid and legitimate investment to those parts of the country which have super-abundant funds, will be promoted by the extension of the membership of the Federal Reserve System. When all has been said and when every consideration has been taken into account, I believe that the thoughtful and non-partisan banker will conclude that the question of membership is one that goes beyond the bounds of immediate business profit. In the course of my remarks to-day I have endeavored to consider the problem with some little detail from the business standpoint. But banking on its higher side is, in my view of the case, a profession. It has its professional standards and its professional requirements. It performs an important public function. The banker must, therefore, consider not only what dividends he can make for his stockholders and what losses he can prevent them from incurring, but he must also think of the fulfillment of this public function in the best way. In the United States we have long suffered from incompatibility and divergence of banking methods. An opportunity is now given for standardization and for improvement of practice. Should not the State banks of the country, which have so long borne an honorable and distinct part in the promotion of the country's commercial welfare, and many of which have charters running back for a long period prior to the formation of the National banking system, stand ready to join in the effort to further the success and insure the greater soundness of banking methods in the United States? They can, if they will, attain these objects by affiliating themselves with the new system and by helping, through their influence and example, to make it a success. It is, I think, to be hoped that they may look at the question from some such standpoint as this, and, in consequence, give their direct aid and support to the Federal Reserve System, as well as draw aid and support from it,—becoming members of it and undertaking to give the fullest possible effect to the beneficial ideas embodied in the Act of 1913.

OUR COMMERCIAL FUTURE IN CHINA

OF China it may be said, probably with greater accuracy than of any other nation, that it is in its commercial infancy. During the year 1913 the Chinese imported foreign goods to the value of $1 per capitum. The United States, in spite of its rich and varied home production, imported foreign goods to the value of $18 41 per capitum. A better idea of the relative insignificance of China's import trade may be gathered from a comparison with the per capita imports of a few European countries: for example, France imports foreign merchandise to the value of $40.11 a year, the United Kingdom to the value of $79.38 a year, and the Netherlands to the value of $236.40 a year.

China's imports in 1913 amounted to a total of $416,000,000. Of this amount the United States supplied 6.2 per cent, or a value slightly over $26,000,000. Japan, as a near neighbor, supplied a value of nearly $90,000,000. Germany's share was $20,000,000, Russia's $16,000,000, Belgium's $11,000,000, and that of France less than $4,000,000. Great Britain's share was by far the largest, but owing to the peculiar circumstances surrounding the transshipment of merchandise at Hong Kong, it is hard to estimate it closely. However, the direct shipments of Great Britain to China amounted in 1913 to over $70,000,000; the American Consul General at Shanghai estimates that 60 per cent of Chinese imports through Hong Kong are British in origin, which would add approximately $48,000,000 more, or a total of over $118,000,000. In addition to this, there were imports from British India of $35,000,000, from the Crown Colony, Straits Settlements, of over $6,000,000, and from Canada of $1,000,000, a total of over $42,000,000. The total of Chinese imports under the British flag, therefore, amounted to not far from $165,000,000, or nearly 40 per cent of the total value of Chinese imports in 1913.

The character of China's imports is not remarkably varied. The demands of her people have been fixed through many centuries, and the companies which have made notable progress in introducing new commodities have succeeded in doing so only through years of persistent effort, and large expenditures of money. The Standard Oil Company and the American Tobacco Company are the two instances most notable in the United States. Chinese imports of American kerosene in 1913 reached the value of nearly $10,500,000, and cigarette imports jumped from a value of less than $6,500,000 in 1912 to a value of over $9,000,000 in 1913, of which the United States supplied over 11 per cent.

The principal imports into China during 1913 were under the head of cotton goods. Opium, sugar, metals, and kerosene were next in order. The list printed below shows in round figures all lines in which imports during that year reached a value of $5,000,000 or over.

LEADING IMPORTS INTO CHINA, 1913.

Cotton goods	$110,000,000	Fish	$10,000,000
Opium	29,000,000	Flour	8,000,000
Sugar	26,000,000	Coal	6,000,000
Metals	19,000,000	Paper	5,000,000
Kerosene	18,000,000	Leather	5,000,000
Rice	13,000,000	Clothing	5,000,000
Tobacco	12,000,000	Arms and ammunition.	5,000,000
Dyes	12,000,000		

Obviously the United States would not be interested to enter the competitive field for all these leading items of the China trade. Opium is at once stricken out. We could hardly compete with the sugar producers of the Dutch East Indies or the Philippines. Germany has supplied 95 per cent of the dyes. There are opportunities under many branches of the cotton goods trade, however; and several excellent opportunities exist in the less developed lines, such as, to take a few miscellaneous examples, paper, hosiery, clocks and watches, meats, and railway materials. The best and most recent technical summary of this subject is to be found in the report of Consul General Sammons, stationed at Shanghai, published in the Daily Consular Reports of the Department of Commerce, under date of November 7, 1914.

In the export field, China, though a commercialy young nation, showed a value for the year 1913 considerably below that of imports, the balance of trade having been against the country to

the amount of $122,000,000. Of the total export value for the year of $294,000,000, the United States took $27,000,000; Japan, $53,000,000; Russia, $32,000,000; France, $29,000,000, and Germany, $12,000,000. It is notable that France purchased from China over seven dollars' worth of goods for each one dollar value of French goods sold to China. On the other hand, Great Britain, the largest seller to China, took in return only a value of $12,000,000 in direct purchases, plus a portion of the $85,000,000 of exports from China by way of Hong Kong. If Great Britain took 60 per cent of Chinese exports to Hong Kong the total value of British purchases from China did not exceed $62,000,000.

The export figures of China show even more strikingly than do the import figures the comparatively undeveloped condition of the country. In 1913 Chinese exports were less than $0.80 per capitum, as compared with a per capita export average of $24.66 for the United States, $32.71 for France, $51.94 for the United Kingdom, and $203.69 for the Netherlands. Raw materials largely preponderate in China's list of exports. Manufacturing is being developed with considerable rapidity, and promises, both on account of the manual skill of the Chinese people, and the low cost of labor, to present a formidable front in the competition for the world's markets. During the year 1913, however, under the head of silk exports, manufactured goods, chiefly piece goods and pongees, reached a value of only $15,000,000 as compared with unmanufactured silk to the value of over $60,000,000. Silk and its manufactures are well in the lead of Chinese export values. The following table shows in round figures all lines in which exports in 1913 reached a value of $5,000,000 or over:

LEADING EXPORTS FROM CHINA, 1913.

Silk	$75,000,000	Metals and minerals	$10,000,000
Beans and bean cake	35,000,000	Oils, vegetable and essential	9,000,000
Tea	24,000,000	Cereals	6,000,000
Hides and skins	15,000,000	Animals	5,000,000
Seeds	12,000,000	Wool	5,000,000
Cotton, raw	12,000,000		

Having reviewed the foreign commerce of China, which is the chief basis of our economic interest in the country, it will be well to bear in mind that the Chinese themselves are in a period of transition. It is probably safe to say that the question of increasing our trade with China cannot be settled until the people have adjusted their internal differences and started forward along a road of solid creative expansion. The present government is republican in form, with President and Cabinet, Vice-President, Senate, and House of Representatives. There are also various foreign advisers, representing the leading nations of the world. Professor Frank J. Goodnow, who resigned his post as legal adviser to President Yuan Shih-K'ai several months ago to become President of Johns Hopkins, is inclined to think the new government is working satisfactorily. Dr. Goodnow, in an interview published recently in the New York "Evening Post," spoke of changes of dynasty in China, and stated that they had been followed by periods of disorder lasting from ten to fifty years. There is every reason to believe that the present radical readjustment will require time to establish itself securely in the confidence of the Chinese people.

"When I left China," Dr. Goodnow continued, "the country was, in general, peaceful and prosperous, the revision of the salt tax had proved satisfactory in placing the finances on a firm basis, and while it is true that White Wolf was still at large, and there was still talk of disaffection in some quarters, the machinery of the Government was working well."

As to whether the Chinese are ready for popular government it is difficult for an American to judge. The facts underlying their status as a nation, however, are at least partially discoverable. In the first place the area of China is easily visualized by a citizen of the United States, for it is only a little less than the combined area of the United States and Mexico. The area of China is given in the Statistical Abstract of the United States as 4,277,120 square miles. On the same authority the area of the United States is 3,627,557 square miles, and that of Mexico 767,323 square miles, a total of 4,394,880 square miles. Taking a European country for comparison, it may be said that the area of China is roughly one-half that of Russia; or from a South American point of view it is a little less that the combined area of Argentina and Brazil, Argentina containing 1,139,196 square miles, and Brazil 3,291,416 square miles, a total of 4,430,612 square miles. The nature of Chinese topography is not unlike that of the United States, in that it contains mountain ranges, broad river valleys, and large expanses of prairie. As in the United States the principal agricultural section is in the Central and Southern portions. The climate, also ranges much as does our own, from arctic to semi-tropical.

The size of China's population has been a bone of contention for a generation. Within the past two months it has been variously stated in current periodicals as 442,000,000, 437,996,300, 336,042,000 and 326,000,000. The explanation of this wide discrepancy is not far to seek; for no accurate census machinery has been developed in China. It is none the less amazing that the variation between the smallest figure and the largest should be greater than the total population of the United States. The estimate of 442,000,000 is adopted by Consul General Sammons in the Daily Consular Report above referred to. The figure of 336,042,000 is apparently taken from the Statistical Abstract of the United States. By far the most plausible authority, however, appears to be the Statesman's Year Book for 1914, which adopts the estimate of 325,000,000. In commenting on the Chinese census of 1910 as published in the Government Gazette, the Year Book makes the following observation: "In 1912, Mr. Rockhill, formerly American Minister at Peking—a recognized authority—after careful inquiry came to the conclusion that 'this document, though showing complete ignorance of the methods now nearly universally followed in vital statistical reports, throws considerable light on the question of China's population and seems entitled to more confidence than the enumerations which have heretofore appeared.' He believed that the population of China, Manchuria, and Chinese Turkestan, i. e. the Chinese Republic exclusive of Tibet and Mongolia, appeared to be in round numbers 325,000,000, new information having confirmed the opinion reached by him in former studies of the same subject that the population of China 'is much smaller than we have been led to believe, and that in the last century it has been increasing very slowly if at all.'"

Taking the estimate of 325,000,000 as correct there still remains a population in China greater by two million than the combined population of Russia, Germany, the United Kingdom, France and Belgium. Of course, if the maximum estimate is adopted the population of the United States and Mexico could be added to these, still leaving a considerable margin in China's favor. In density of settlement China ranks well up in the list of nations, though far from being, on a comparative basis, highly congested. The population per square mile in China is 78.57 as compared with an average of 27.14 per square mile in the United States. This is well above Australia, for example, with its 1.59 per square mile, or Canada with 2.00, or Brazil with 7.39; and it is considerably denser than Russia with 20.02 inhabitants to the square mile. On the other hand it is well below the French average of 191.19; the German, of 316.56; that of Great Britain, of 345.79; the Japanese, of 354.18; or that of Belgian before the present war, namely 666.40.

There is a considerable urban tendency on the part of the

Chinese people but the size of urban population is popularly overestimated. Peking, the capital, had a population in 1912 of approximately 625,000. The other cities of 500,000 inhabitants or over were in the same year, Canton, with 900,000; Hankow, 826,000; Tientsin, 809,000; and Shanghai, 651,000.

The population is notoriously diversified in character. The people of the North, for example, in many instances have nothing in common with the Southerners, not even their language. The flag adopted by the new Republic a forcible witness to the varied origin of the races that it supplants the old yellow dragon with a banner of five stripes, representing the races of which the China of to-day is made up—red for the Mongol, yellow for the Chinese, white for the Manchus, blue for the Turki (from Chinese Turkestan), and black for Tibet. The actual foreign population of the country is very small. It was estimated in 1912 at slightly over 700,000, of which number the Japanese comprised more than half, or 350,000. The remainder was made up as follows: Russians, 47,000; British, 5,000; Americans, 4,000; Germans, 3,000; Portuguese, 3,000; and all others, 2,000.

The growth of [illegible] throughout China is doing much to unify the people. The development and widespread use of a common speech will go far to simplify the problems of the Republic. Then, too, the contact with Western civilization will increasingly inculcate a desire for industrial and commercial growth, with its necessary accompaniment of sound and peaceful internal conditions. But Dr. Goodnow, in the interview already referred to, brought out very clearly that the Chinese nation has not unlearned in a generation the carefully accumulated knowledge of so many centuries, nor ceased to carry on official business in the time-honored Chinese way.

"I think," he said, "that we in this country are apt to overestimate the influence of the returned student from America and Europe in China's latest crisis. These students are comparatively few in number, and are to be found chiefly in the coast cities. Their training has led them away from the educational traditions of their own country, and this fact has lessened the influence they would otherwise exert. In China it is still necessary that a man in public life possess literary qualifications, not merely a knowledge of the classics, but facility in writing in an artificial, conventional style, which abounds in allusions to the classics. There was a time not many generations back when an Englishman addressing the House of Commons could hardly win the attention and respect of the members without interlarding his speech with quotations from the classics. China has not outgrown this stage of development, and the classics are still a power. The young student from the West who fails to master the style in which official correspondence is conducted will be judged accordingly, and he will be under the disadvantage of not fully comprehending communications he may receive.

"A student returning from Japan is more fortunate. There also the Chinese student goes to learn wisdom, and he returns to China with the evidences of [illegible] special training Japan's schools afford, and at the same time with a working knowledge of his own code.

"It would be a mistake to expect the transformation of the old Empire into a republic, reproducing American governmental ideals in so short a time. This never has been done. A system has been developed and the foundation [illegible] for development along constitutional lines, and the people and the foreign element in China are delighted with the progress that has been made."

Another vital consideration in amalgamating so numerous a people in a country of such great distances is the transportation question. The length of railway in China in 1912 was 6,123 miles. In the same year there were 6,135 miles of railway in the State of Nebraska, 8,500 miles in the State of New York, and 236,816 miles in the United States. This mileage was an average of .2 miles for each 10,000 inhabitants in China, 50.3 per 10,000 in Nebraska, 8.9 per 10,000 in New York, and 25.9 per 10,000 inhabitants of the United States. The Chinese mileage, further, was in the ratio of 1.4 miles of railway for each 1,000 square miles of area, as compared with 83 miles of railway per 1,000 square miles of area in the United States. It is obvious that railroad building is a matter of prime importance to China, and the fact that European capital has been so largely concerned in financing it must now be considered in estimating the time which will be required for China to attain her industrial maturity. In this connection an observation of Consul General Sammons in his report on China is pertinent.

"Although many contracts for new railroad lines have been signed," says Mr. Sammons, "none of them has reached the construction stage. When the surveys are completed there will undoubtedly be a remarkable advance in imports of railway materials and supplies. American manufacturers are aware, however, that contracts of this kind usually provide that materials and supplies must be purchased in the country supplying the loan money. Materials will probably be received this year (1914) for the Pukow-Sinyang line and the extension of the Shanghai-Nanking Railway to Pinghsiang, both of which are British projects."

In this suggestion of Mr. Sammons with regard to the purchase of supplies from the country making a loan is contained a very large part of the secret of the preponderance of British trade in China which has been indicated above. The United States has hardly entered the competition for the commerce of the world. Her exports have amounted to less than 5 per cent of her national output, while the principal European countries have been exporting 60 per cent of theirs. As pointed out in this paper several months ago, the United States has not been outdistanced in a struggle which was vital to her. On the contrary, this nation may fairly be said never to have entered the modern commercial arena up to this time. If present circumstances provide the inspiration for a square entrance into the struggle, it can only be in a big way. The prize is tremendous. The Department of Commerce at Washington estimates the total trade of the world at $40,000,000,000. Of this amount, the United States, in 1913, contributed four and one-half billions. Surely this is not a field to enter upon in sporadic fashion or with anything but the best equipment. To win a share in Chinese trade, the full maturity of which will only be seen in the distant future, the people of the United States must contribute their share in helping the Chinese people to their feet. As further authority for this view as to our commercial future in China, there may be quoted, in concluding this review of the facts, the statement of Mr. Willard Straight, of J. P. Morgan and Company, made in the course of a recent speech as President of the American Asiatic Association.

"If and when stable conditions are restored in China," said Mr. Straight, "and if American investors can be induced to purchase Chinese securities, it is but reasonable to hope that we may be able once again to assume a more important commercial position in the Far East.

"Numerous opportunites will without question be offered to Americans. The ordinary exchange of commodities should be greatly stimulated. Any great extension of our trade, however, must depend upon our readiness to advance funds for China's development."

INDUSTRY, COMMERCE AND FINANCE

Crop Yields in the United States for 1914.—On Monday, November 9, the Bureau of Statistics of the Department of Agriculture issued its preliminary quantitative estimate of this year's production of corn, completing thus its list of estimates of all the major crops, except cotton, for the season of 1914. The following table gives the figures for all crops, with the final figures for 1912 and 1913 for comparison:

ESTIMATED YIELDS OF THE MAJOR CROPS IN THE UNITED STATES.

	1912. Final Figures.	1913. Final Figures.	1914. Est. Figures.
Corn (bushels)	3,124,746,000	2,446,988,000	2,705,692,000
Wheat (bushels)	730,267,000	763,380,000	891,950,000
Oats (bushels)	1,418,337,000	1,121,768,000	1,139,741,000
Barley (bushels)	223,884,000	178,189,000	196,563,000
Rye (bushels)	35,664,000	41,381,000	42,664,000
Buckwheat (bushels)	19,249,000	13,833,000	17,025,000
Flaxseed (bushels)	28,073,000	17,853,000	15,973,000
Potatoes (bushels)	420,647,000	331,525,000	406,288,000
Hay (tons)	72,691,000	64,116,000	63,604,000
Tobacco (pounds)	962,855,000	953,734,000	982,715,000

In addition to the aggregate figures of the production of the several crops, the Department of Agriculture has issued supplementary statements regarding the average yield per acre and the average farm price this season, as compared with previous seasons. In condensed form, these statements are as follows:

CORN.—The average yield per acre in 1914 is estimated at 25.7 bushels, as compared with 23.1 bushels last year, and an average for the past ten years of 26.7 bushels. The average farm price of corn on November 1, 1914, was 69.7 cents per bushel, as compared with 70.7 cents last year. The estimated acreage planted to corn in 1914 was 105,067,000 acres, against 106,884,000 acres in 1913.

WHEAT.—Average yield per acre in 1914, 16.7 bushels, compared with 15.2 bushels in 1913, and a ten-year average of 14.4 cents. Farm price on November 1, 1914, 96.2 cents per bushel, compared with 77 cents in 1913. Weight per measured bushel, 58 pounds for 1914, against 58.7 pounds last year and a ten-year average of 57.9 pounds.

OATS.—Farm price for 1914, 42.5 cents per bushel, against 37.9 cents in 1913. Weight per measured bushel 31.5 pounds for 1914, compared with 32.1 pounds for 1913, and a ten-year average of 31.7 pounds.

BARLEY.—Farm price for 1914, 51.3 cents per bushel, compared with 54.7 cents in 1913. Weight per measured bushel, 46.2 pounds in 1914, against 46.5 pounds in 1913, and 46.8 pounds for the ten-year average.

RYE.—Farm price for 1914, 86.6 cents per bushel, compared with 63.2 cents for 1913.

BUCKWHEAT.—Average yield per acre in 1914, 21.4 bushels, compared with 17.2 bushels in 1913, and 19.7 bushels for the ten-year average. In 1914, the farm price of buckwheat has average 78.1 cents per bushel, as compared with 75.5 cents in 1913.

* * *

British Trade in October.—According to the estimate of the British Board of Trade, the imports during October, 1914, amounted to £51,559,000, or $257,795,000. This is a decrease of £20,171,000, or $100,855,000, as compared with October, 1913. It is an increase, however, over the amount for September, 1914, of £6,507,000, or $32,535,000.

Exports for October are placed at £28,602,000, or $143,010,000, a falling off of £18,021,000, or $90,105,000 from the figures for October, 1913. The October export total, however, shows an increase of £1,900,000, or $9,500,000 over that of September, 1914.

The chief decline in imports is shown under the head of raw cotton from the United States, which fell off $27,500,000; under that of raw cotton from Egypt, which declined $7,500,000, and under that of manufactured articles, which showed a loss of $35,000,000, as compared with the corresponding month in 1913.

The chief losses in exports were those in manufactured goods, amounting to $67,500,000; in cotton yarns, amounting to $26,250,000; in wool yarns, amounting to $6,250,000; and in coal, amounting to $10,000,000.

The following figures show the total value of imports and exports for the past five months as compared with the corresponding months in 1913, and the total value of imports and exports for the first ten months of 1914 and 1913:

BRITISH TRADE, 1913 AND 1914 (IN PART).

Imports.	1914.	1913.
October	£51,562,000	£71,732,893
September	45,056,086	61,359,086
August	42,362,034	55,975,704
July	59,383,792	61,783,683
June	58,272,042	58,309,519
Exports.		
October	£38,158,000	£56,178,843
September	33,527,877	49,277,877
August	28,631,104	52,261,228
July	52,231,296	55,475,551
June	48,626,410	51,377,685
Ten Months.		
Imports	£574,079,311	£629,518,149
Exports	465,702,569	529,304,884

Money Circulation in the United States on November, 2, 1914.—The Treasury Department's monthly statement of the money in circulation and of the total stock of money in the United States, shows that on November 2 the total amount of money in circulation was $3,715,522,306, as compared with $3,694,748,196 on October 1,—an increase of $40,774,110 for the month. The general stock of money in the United States on November 2 was $4,055,483,117, as compared with $4,037,735,626 on October 1,—an increase of $17,747,491. During the month of October there was a decrease of $26,421,966 in the country's stock of gold and an increase of $43,584,135 in the amount of bank notes (including emergency currency). The per capita circulation of money in the United States on November 2, 1914, was $37.31, as compared with $37.15 on October 1, 1914.

The following tables show the amounts of the various kinds of money in circulation and the general stock of the same on November 2, 1914, with comparisons for previous months and years:

MONEY IN CIRCULATION.

	Oct. 1, 1914.	Nov. 2, 1914.	Nov. 1, 1913.	Jan. 1, 1879.
Gold coin	$657,944,193	$665,854,219	$614,478,201	$96,262,850
Gold certificates†	931,390,259	913,347,859	1,021,451,879	21,189,280
Standard silver dollars	70,724,311	70,273,451	74,012,152	5,790,721
Silver certificates†	482,892,121	482,776,199	480,079,731	413,360
Subsidiary silver	161,565,114	162,470,390	160,486,188	67,982,601
Treasury notes of 1890	2,388,789	2,377,389	2,583,874	.....
United States notes	336,974,240	334,903,719	341,401,413	‡310,288,511

Totals	$4,037,735,626	$4,055,483,117	$342,987,430	$339,960,811

*This statement of money held in the Treasury as assets of the Government does not include deposits of public money in National Bank Depositaries to the credit of the Treasurer of the United States, amounting to $65,742,794.98. For a full statement of assets see Public Debt statement.

†For redemption of outstanding certificates an exact equivalent in amount of the appropriate kinds of money is held in the Treasury, and is not included in the account of money held as assets of the Government.

‡Includes $33,190,000 Currency Certificates Act, June 8, 1872.

§Includes additional circulating notes issued under authority of act of May 30, 1908, as amended by acts of December 23, 1913, and August 4, 1914.

INSURANCE

THE New York Workmen's Compensation Commission has adopted the popular course by announcing that the State Fund for the insurance of employers against workmen's compensation risks will pay to such employers as are insured with the Fund a premium dividend of 15 per cent upon the six months' policies expiring December 31, 1914, and promises, that there will be a further reduction of 11½ per cent from the manual rates approved by the New York Insurance Department, upon all renewal policies with the State Fund. It is to be presumed that the premium rate reduction will apply also to new policies taken out with the State Fund on and after January 1, 1914. As the premium rates adopted for the State Fund before the workmen's compensation act went into effect on July 1 last, were 8½ per cent lower than the manual rates to which the liability insurance companies must conform, under the authority of the New York Insurance Department, the new premium rates of the State Fund will be 20 per cent lower. On the face of it, this is an enormous disparity in favor of the State Fund, and no doubt the Workmen's Compensation Commission anticipates a multitude of transfers of policies from the private insurance companies to the State Fund. We may expect that this exodus will be publicly urged by Chairman Dowling, of the Commission, with all the alluring generalities about the wonders wrought by the Commission itself and by the State Fund, which have characterized his utterances from the beginning. We have already been told by him that the Commission is able to conduct its operations, despite the newness of its organization and the lack of experience of its officials, at the lowest expense ratio ever attained by any body charged with the administration of workmen's compensation in the world,—i. e. "within 7 per cent," while the best the Germans have been able to do, with large expense items met by the Government, is about 12 per cent. It is, therefore, easy to imagine with what unction he will point to the ability of the State Fund to write workmen's compensation insurance at rates 20 per cent lower than those which have been determined to be the minimum rates compatible with safety which the liability insurance companies may use. And he will, of course, add that by means of the system of schedule rating which the Commission is putting into effect for the State Fund, the premiums required will undergo a further large reduction for those employers whose plants are provided with approved safety devices. Thus all will tend to show the unapproachable superiority of the State Fund as a carrier of workmen's compensation insurance in the State of New York.

It is impossible to foretell what effect these representations and the [illegible] of the Commission will have upon the minds of New Yorkers [illegible]. Nor is it known what steps, if any, will be taken [illegible] insurance companies to meet conditions [illegible] from bearing out as justified [illegible]. But it is extremely difficult for a [illegible] compensation the world over [illegible] of a public body [illegible] most important [illegible] and disregard of the [illegible] matter. It has been [illegible] that [illegible] rates lower, and with the [illegible] that the [illegible] whatever [illegible] of the claimants [illegible] rates which are adequate to meet them. It is [illegible] that it is possible [illegible] by [illegible] that [illegible] to arrive at the actual cost to itself of the reported and adjusted accidents of the first six months of its existence. The New York State Fund, for example, has undoubtedly attempted to determine actuarily the total cost of such accidents as it has been called upon to compensate from July 1 up to the present time; and it is on the basis of this calculated cost that a dividend of 15 per cent has been declared as returnable to the Fund's policyholders. But the truth is that whatever actuarial computation has been made has necessarily involved pure assumptions of the most far-reaching kind. Thus, a factor that must very greatly affect the ultimate cost of accident compensation, under a law like that of New York, is the expectancy of remarriage on the part of widows of victims of fatal accidents. But who knows what the remarriage rate will prove to be in the State of New York? There is absolutely no statistical experience on the subject in this country,—the only extensive data available being the remarriages of widows of Civil War and Spanish War soldiers and veterans as shown by the records of the Pension Office, which data, however, have never been studied from an actuarial point of view. The New York Commission has adopted in this connection remarriage tables compiled by the Dutch governmental insurance authorities; but there is every reason to believe that marriages and remarriages, unlike deaths and accidents, vary widely in their averages from country to country. Social customs and standards of popular morality may obviously have a very great influence. In the Scandinavian countries, for example, where the illegitimacy rate is the highest to be found anywhere in the civilized world, it is to be expected that the remarriage rate would be low, because of the lack of social disgrace in the working classes attending irregular unions and the strong motive for irregularity in the continuing pension itself. Now, the illegitimacy rate in Holland is far lower than it is in the Scandinavian countries,—indeed, compares favorably with that in countries like England, France and Germany, and it may be presumed that the Dutch remarriage rate is not materially affected by an exceptional standard of popular morals with regard to irregular unions. But the body of Dutch workers is in all kinds of ways different in social and economic conceptions from the body of American workers. It must, therefore, long remain a matter of assumption pure and simple that, in an actuarial calculation of the ultimate cost of the accidents occurring among American workers, the Dutch remarriage rate will prove to be dependable. It is, doubtless, the best guide we as yet have, but all that can be said of it is that, in default of actual American experience, it may be used with a wide margin of error.

The illustration just given is only one out of many that might be given of the extensive element of assumption that necessarily finds a place in workmen's compensation cost calculations under a new, untried and in many essential points uninterpreted act like that of New York. It is a rule so general that it may almost be called a law that early estimates of the cost of workmen's compensation are invariably far too low; and this is especially true where the estimators are public officials with political instincts and a desire to magnify their achievements in the public eye. In all the States in the Union in which workmen's compensation has either been made a public monopoly or been entrusted in part to the management of public officers the same phenomena have presented themselves—premature acceptance of the early and still incomplete experience as final, triumphant comparison of the cost results of this experience with the mature and of course far higher cost results of private insurance carriers, and efforts to seduce business from these private insurance carriers on the ground of their unnecessary and extortionate charges. It is a condition of things which only time, with its unerring finger, can set right.

THE INAUGURATION OF THE CASUALTY ACTUARIAL STATISTICAL SOCIETY OF AMERICA

MORE than a mere incident of temporary interest and importance, the first meeting of the new-formed Casualty Actuarial and Statistical Society of America has taken its place on the records of solid insurance achievement, of constructive work well done. The first meeting of this society was held at the City Club, New York City, on Saturday, November 7. The transactions of this meeting are chronicled here, both because of their probable,—almost certain,—future historical interest and because they indicate a mile post along that endless road of development upon which liability insurance has entered, recently as compared to many other branches of insurance, to be sure, but which must be followed to its ultimate conclusion.

A society such as the present organization was first suggested by Mr. Stanley L. Otis some years ago, but at the time did not receive sufficient support to warrant its formation. Thus it was not until last June that the organization committee, consisting of Dr. I. M. Rubinow, Chief Statistician of the Ocean Accident and Guarantee Corporation, Temporary Chairman; C. E. Scattergood, Assistant Secretary of the Fidelity and Casualty Company, Temporary Secretary; J. F. Mitchell, Secretary of the Maryland Casualty Company; B. D. Flynn, Assistant Secretary of the Travelers Insurance Company; E. Scheitlin, Statistician of the Globe Indemnity Company; and Frank R. Mullaney, of the Statistical Department of the Fidelity and Casualty Company, began their work of securing memberships and preparing for the first meeting. On July 27 the committee sent out membership invitations to those whom they knew to be interested in casualty actuarial and statistical work, and asked them to suggest the names of others interested in the same lines of work. In this manner the charter membership was secured. The list is as follows:

CHARTER MEMBERS.

W. C. Archer
W. M. Amerine
F. S. Baldwin
Roland Benjamin
S. Bruce Black
William Breiby
Richard Brodin
George B. Buck
W. A. Budlong
E. E. Cammack

S. H. Wolfe
H. R. Woodward
J. H. Woodward
William Young
E. C. De Ray
J. S. Thompson
J. F. Larkin

The meeting was called at three o'clock in the afternoon, and, after an introductory address by Chairman Rubinow, a constitution and by-laws were adopted, subject to later modification, according to suggestions from a committee appointed by the chair. The constitution and by-laws included the following provisions:

"The Casualty Actuarial and Statistical Society of America has for its object the promotion of actuarial and statistical science as applied to problems of casualty insurance, by personal intercourse, the presentation and discussion of appropriate papers, the collection of a library on subjects pertaining to these problems, and such other methods as may be found desirable. For the purposes of this organization casualty insurance shall consist of lines of insurance covered by the miscellaneous annual statement uniform blank at present in use and approved by the National Association of Insurance Commissioners.

"Those eligible for fellowship are persons who are or shall have been in charge of actuarial or statistical departments of casualty insurance companies, or of organizations or associations connected with casualty subjects. In this class shall also be included those who have made valuable contributions to actuarial science or statistics as related to casualty subjects. Those eligible for associate membership are persons in actuarial or statistical departments of casualty insurance companies or any other persons who evince a desire to study actuarial science or statistics as related to casualty subjects.

"The Council shall establish a system of examinations for the admission of associate members to fellowship. Associate members and fellows who have qualified through the passing of such examinations shall be admitted by the majority vote of the members at a regular meeting.

"The Council shall have power to admit without examination to either class of membership, but a two-thirds vote of members present at a regular meeting shall be necessary for admission to such members."

The officers elected consist of President, Dr. I. M. Rubinow, Chief Statistician of the Ocean Accident and Guarantee Corporation; Vice-Presidents, B. D. Flynn, Assistant Secretary of the Travelers Insurance Company, and A. H. Mowbray, Actuary of the Massachusetts' Employees Insurance Association; Secretary-Treasurer, C. E. Scattergood, Assistant Secretary of the Fidelity and Casualty Company; Librarian-Auditor, W. W. Greene, Assistant Actuary, New York Workmen's Compensation Commission; members of Council; J. D. Craig, Assistant Actuary, Metropolitan Life Insurance Company; Robert K. Orr, Manager State Accident Fund, Lansing, Mich.; F. L. Hoffman, Statistician, Prudential Insurance Company, and A. W. Whitney, Manager, Workmen's Compensation Service Bureau.

After the formalities of organizing were completed, the meeting was addressed by Mr. A. R. Marsh, of THE MARKET WORLD AND CHRONICLE, who laid emphasis on the broad scope and possible value of the society, both to the companies and to the public at large, and complimented the members collectively on recognizing the necessity for such an organization. The meeting then proceeded to the reading of papers by Dr. I. M. Rubinow on "Scientific Methods of Computing Compensation Rates" (given in full on other pages of this issue); by Mr. A.H. Mowbray on "How Extensive a Payroll Exposure is Necessary to Give a Dependable Pure Premium"; by Mr. D. W. Greene on "Valuation of the Death Benefits Provided by the New York Compensation Law"; and by Mr. C. E. Scattergood on "Reserving Under Workmen's Compensation Insurance by a Method of Pure Premium Losses." It is the purpose of the Society to publish in its "proceedings" papers accepted by the Council and presented at the meetings, the "proceedings" to be issued from time to time. Arrangement will be made for exchanges of proceedings with other organizations interested in statistical work.

The meeting was then adjourned and the members dispersed until seven o'clock, when dinner was served at the City Club. The President-elect, Dr. I. M. Rubinow, called upon one representative of each of the different varieties of work represented on the occasion to speak. The first was Mr. Arthur Hunter, former Vice-President of the Actuarial Society of America, who assured the Society of the friendly interest of the older organization. Then followed Mr. F. L. Hoffman on "Statistics in General"; Mr. M. M. Dawson on "Various Aspects of Social Insurance"; Mr. Charles Hughes on "State Insurance Departments"; Mr. Frank E. Law, as one of the earliest casualty actuaries; Mr. J. H. Woodward on "State Insurance Funds"; Mr. Elmer H. Dearth on "Mutual Compensation Insurance Companies"; Mr. Stanley L. Otis, as one who some years ago conceived the idea of such a society; Mr. C. E. Scattergood on "The Present Plan of Securing and Compiling Statistics by the Workmen's Compensation Service Bureau"; and Mr. E. B. Phelps, as the representative of the insurance press, on the value of accumulated statistics as a means of educating public opinion as to the truth about insurance. The meeting then came to an end.

Thus, almost at one stroke the machinery has been established for the scientific carrying on of the business and study of liability insurance. The work of the Workmen's Compensation Service Bureau, described in the issue of this paper for October 31, has provided for the gathering of data and the organization of this new Society has provided for the use of that data with the greatest possible efficiency. The scope of the Society is even larger than that of the Bureau, however, since it includes all branches of liability insurance. The machinery having been provided, the future is now in the hands of those whose task it is to keep the complicated mechanism running smoothly, and on them rests the responsibility of developing it to its highest usefulness.

SCIENTIFIC METHODS OF COMPUTING COMPENSATION RATES

By I. M. Rubinow, M. D., Ph. D.*

Chief Statistician, Ocean Accident and Guarantee Corp., Ltd. President, Casualty Actuarial and Statistical Society of America

THEORETICALLY the problem of compensation rates does not differ from that of rates in many other forms of insurance. The formula for premiums on any classification appears as $\frac{\text{losses}}{\text{payroll}}$ plus any loading for commissions and expenses agreed upon or found necessary. There is only one difficulty about this formula—we do not know the enumerator of this fraction, under which condition it is not quite an easy matter to compute its value.

The same formula is the basis of liability insurance, and time is relied upon to furnish the necessary volume of exposure, without which the results of the fraction are likely to be purely accidental and subject to violent fluctuations. That a large exposure is necessary to produce a true average, or in other words, that the fluctuations will be in inverse proportion to the size of experience is a truth which does not require any proof before a body of insurance men. It is quite evident, therefore, that it will take a long time under compensation experience before that necessary volume of exposure shall have been gathered.

It is obvious, however, that compensation rates must be quoted as soon as a compensation goes into effect, and for some time after that while the necessary volume of experience is being accumulated. This presents the first difficulty.

It is true that the United States is not a pioneer in compensation insurance. In various countries experience has been accumulating for many years, up to as long as thirty years in Germany. The question is often asked by many persons outside of the insurance circles why the result of European experience in regard to pure cost cannot be utilized in this country. There are a good many reasons for this. The one that is mentioned first of all is perhaps the least important one. It is argued, and with a good deal of justice, that industrial conditions in Europe and in this country are not similar, that accidents happen more frequently in the United States, and, therefore, the pure premiums would not be equal. While this is undoubtedly true in a great many industries, it is by far not the greatest difficulty. More important are the differences in the compensation scales, of which the losses are results. And finally, there is the greatest handicap which statisticians will especially appreciate.

European statistics are seldom published, or even prepared in such detail as to give the necessary data for each separate classification. We have in our manual approximately 1,500 different classifications, and their number is rapidly growing. This results from the praiseworthy effort to do justice to each line of industry, to charge it no more than its hazard requires. It is almost impossible to oppose this tendency towards fine distinctions, for if rough grouping were insisted upon, the way would be open to the competitor to select the least hazardous subdivisions of each classification, and underbid on them. It is useless to look in European statistical sources for the pure premiums on any of the subdivisions of "Concrete Work" or "Masonry" or such odd classifications as "Military Good Mfg."

Proceeding from the formula Pure Premium $= \frac{\text{Losses}}{\text{Payroll exposure}}$, therefore, we seem to be thrown back upon our resources, upon the the necessity of compiling our own experience which requires time before the necessary experience is accumulated. At first glance, it would seem that the greatest difficulties are already behind us.

In New Jersey, compensation is nearly three and a half years old; in Illinois, some two and a half years old; in Massachusetts, twenty-eight months, and so on.

But that only slightly relieves, and does not altogether abolish all difficulties. As against these two or three States, we have States like New York, or Iowa, where compensation is only four months old, Maryland, in which the compensation went into effect a week ago; Kentucky and Louisiana, where January 1 is the fateful date, and about a score of States in which the compensation acts are in various stages of preparation or contemplation. In all of these States compensation rates have to be quoted to-day, or to-morrow, or in the very near future. And yet no experience exists. It is not too much to say that no other country in the history of the compensation movement presented a problem of similar complexity, since none had an avalanche of compensation acts, no two alike, no two coming in at the same time. As a result while the situation becomes somewhat simplified in some States, because of the accumulation of experience, it arises in all its difficulties in other States, and relief is not yet in sight.

Moreover, there remains the greatest, most fundamental difficulty in applying this method, which even years of experience may not eliminate. Because of the existing division of the country into some fifty independent legislative units, the possible exposure on one classification will be insufficient in one State to produce an average, except in so many years, that meanwhile conditions may entirely change, and make the accumulated experience entirely useless. That unfortunately is true of the greatest number of

*An address before the first meeting of the Casualty Actuarial and Statistical Society of America.

classifications. Of course, there are exceptions, in States as well as in classifications. New York, industrially, is an empire of itself. The exposure on most classifications will be so large that in comparatively few years a true average will have been obtained. In other smaller States, the exposure may be sufficiently great in a few industries, for which the State may be famous. Massachusetts does not need the aid of other States to obtain a true broad experience on boots and shoes. The same may be true in cotton spinning and weaving in South Carolina, or beer brewing in St. Louis or Milwaukee.

But how about the vast majority of diversified industries? The readiness to go by a small volume of experience is one of the peculiar errors of early underwriting in this country. When the Massachusetts Insurance Department compiled and published its famous schedule Z, for 1913, showing the compensation experience for separate classifications, it very wisely decided that below a certain minimum of exposure the experience was not worth presenting. The accepted minimum was very small—only $500,000, and yet only 134 out of the possible 1,500 were able to pass that test. But such an exposure is hopelessly inadequate to produce even an indication of an accurate rate.

The average pure premium in Massachusetts was some 36 cents. Let us assume that an ordinary fatal accident would cost $2,400. One fatal accident, therefore, in a certain classification represents a pure premium of 48 cents on half a million of exposure, 24 cents on a million of exposure. One fatal accident, therefore, may double the pure premium on many a class. The purely accidental fact that between two fatal accidents in two different classifications, one happened to a married employe, and another to an unattached bachelor, may produce a wide margin between the two costs and two premiums. Only then may we begin to speak of a dependable experience when at least one accident will not seriously disturb the average pure premium. If a certain classification has a pure cost of $1, then an exposure of $10,000,000 may be sufficient, because one $2,000 or $3,000 loss will not affect the pure premium more than 2 per cent or 3 per cent. But in less hazardous occupations, where the pure premium may be ten or twenty cents, a very much larger exposure will be necessary to produce results that are actuarily dependable. And if that is so, how long will it take some of the smaller States to accumulate such volume of experience? For instance: When will Nebraska be able to determine its pure premium on "suspenders without buckles," or Rhode Island on "butcher's supplies"? And yet rates must be quoted for either, and moreover they must be adequate and equitable.

Some two years ago I pointed out this difficulty in an article in THE MARKET WORLD AND CHRONICLE, and suggested the necessity of grouping the numerous classifications. In fact, I had the temerity to announce that in my leisure hours, and after burning a good deal of midnight oil, I had prepared a tentative grouping of classifications. Immediately numerous requests from State Departments and casualty companies arrived for copies of this grouping. The State of Wisconsin adopted it with some modifications.

The Massachusetts Insurance Department now very anxiously urges such grouping into some 150 groups according to similarity of hazard. The Bureau has recently adopted this suggestion, and a tentative grouping of classifications has been prepared by several members of its Statistical Committee which finds expression in the mysterious classification numbers found in the Basis Manual. The need for such grouping is well illustrated by the fact that the Chief of the Federal Bureau of Labor Statistics has expressed his anxiety to publish it as an official document. Nevertheless, too much reliance must not be put on it in the beginning. Its aim is to group together classifications of similar hazard—but what do we know of exact measurements of hazard? That is the very thing that experience must in the future produce. For hazard is not to be measured by the likelihood of producing accidents, but by the actual causation of such hazards. Theoretically, equal hazard is to be defined as the factor which produces the same number of accidental injuries, and also the same distribution of accidental injuries per equal exposure in different classifications. At present the measurement of hazard is only an opinion, euphoniously called underwriting judgment, while actuarial science as well as sound business requires that rates be based on *facts*. The grouping of classifications must, therefore, be tested by actual experience, and again a sufficient volume of exposure is necessary for such testing.

The conclusion is inevitable, therefore, that some method of combining experience of different States is absolutely necessary, if we are to arrive at scientific rates within a reasonable time. That is true even after compensation has been written for some years. And in the beginning it is doubly necessary that some method be devised other than that of actual experience under each separate act, so that some use be made of every scrap of information both American and European.

I hope that I shall not be charged with undue pride for stating that nearly two and a half years ago I outlined the elements of such a method, which was further developed by such well known actuaries as Professor A. W. Whitney and Mr. A. H. Mowbray, and though it met with a considerable opposition in the beginning, succeeded in becoming the foundation upon which all the present compensation rates are built. In an article published in THE MARKET WORLD AND CHRONICLE (June 22, 1912), I indicated that the compensation pure premium for any classification resolved itself into three factors: first, the accident rate; second, the distribution of accidents according to gravity, or according to the nature and duration of the injury, and third, the compensation scale. Knowing these three factors, we could compute the cost of a hundred or a thousand accidents, or what amounts to the same, the average cost of an accident, and apply it to the accident frequency for each classification.

This is the bare outline of the plan as suggested at the time. The compensation scale is known—it is stated in unmistakable terms in the law. American students approaching the problem usually assumed that there were no definite data in regard to the other two factors, accident frequency and accident gravity. It appeared then to me that the problem was not an impossible one. The insistence of American casualty companies upon receiving reports of all accidents to employes if assured is well known. Accidents are reported in this country to casualty companies very much better than, for instance, in England, as personal enquiries have convinced me. An evidence is the very much smaller proportion of claims to accidents in this country than in England. I hoped at the time that perhaps casualty companies might see their way to undertake such an investigation in their files. It has never been done, and, therefore, this part of the plan has a purely historical interest at present. But since it was argued at the time that such an investigation was altogether impossible, I want to point out that it is being done now on a very much smaller scale every day in the compilation of experience for merit rating, and will be done at the very much greater rate from now on.

It was argued at the time that liability accident reports were worthless even for obtaining accident frequency only, but now they are being used for accident gravity as well.

The main contribution of my plan was contained in the suggestion that European experience might be utilized for the purpose of

distributing accidents into groups according to gravity. Though an extremely simple and almost obvious suggestion to any one who has made any study at all of foreign accident statistics and could not fail to be struck by the identical results in all countries, it appeared like a new scientific clue to many actuaries who were groping for some practical method of computing the cost of compensation. Professor A. W. Whitney was the first, I believe, to apply it. Mr. A. W. Mowbray tested it critically and found a good deal of evidence to corroborate what he was kind enough to designate as "Mr. Rubinow's hypothesis." I believe for some time it was even good naturedly referred to as 'Rubinow's law."

While both these students could not use the methods outlined for the purpose of computing actual rates (because the necessary factor of accidental frequency was lacking) they both, entirely independently of each other, utilized it for a somewhat more modest purpose of measuring the comparative costs of different compensation acts and bills. Justice requires me to state, therefore, that the Rubinow hypothesis became a workable instrument of actuarial science only after the application made by Professor Whitney and Mr. Mowbray.

The first official sanction was given to the method by the New York Insurance Department in the work of establishing the basis for New York compensation rates. No one interested in compensation matters need be reminded of the brilliant work done so recently by Mr. W. W. Greene. The disputable question as to final differential need not be gone into here, lest this peaceful meeting break up in a riot, but the final triumph of the method used by him (of measuring the comparative values of compensation scales by applying a standard table of accident gravity) cannot now be disputed.

The material which Mr. Greene and the department was forced to use for lack of time was not the very best. The Massachusets distribution of accidents was highly unsatisfactory, the Austrian figures used, without any correction, may have been somewhat one-sided, nevertheless it was the first large effort in the preparation of law differentials.

The problem which the New York Insurance Department had to solve was that of differentials only. But the casualty companies and the assured needed something vastly more difficult—they needed actual rates. The methods by which they were computed are recent history, and need not be described in any great detail. The formula used was:

Basic Pure Premiums x loading for underestimates x law differential x loading for expenses . 1 x 1.08 x 2.00 x 1.50 = 3.24.

The basis pure premium was obtained from the original formula $\frac{\text{Losses}}{\text{payroll}}$, but since the payments had not all been made, and there was reason to believe that the estimates on outstanding payments were somewhat inefficient, these were loaded by an arbitrary amount. The law differential and the expenses for loading were equally matters of conjecture.

Our judgment of the value of the former must be entirely independent of our opinion as to accuracy of the individual factors. It clearly appeared that some such formula was necessary so long as rates had to be made for States in which such experience did not exist at all, or was altogether [illegible]

In this process of ascertaining the proper law differential was of paramount importance. At this juncture Professor Whitney conceived the fruitful idea of appointing a differential committee to devise a method of [illegible] and actually to compute such differentials [illegible] to all because of their evidence of [illegible] if not absolute accuracy.[1] How successful this proposal was can be proven by the remarkable fact that the differential committee was able to make unanimous reports of all differentials which they prepared including some fifteen States. As compared with acrimonious discussions following the New York law differential this represents a noteworthy achievement. It may be designated as the first victory of the principle upon which this society is built—the principle of unbiased scientific inquiry applied to casualty problems.

Law differentials had been used before in the preparation of compensation rates, but represented rather crude guesses or estimates. It is a comparatively easy problem to measure the comparative provisions of the law in regard to a certain group of accidents. If, for instance, the New Jersey Act grants 50 per cent and the New York Law 66⅔ per cent in certain cases, then they will cost one-third more in New York than in New Jersey.

The difficulty arises in trying to measure the differential for all the provisions of the law, when each particular difference must be carefully weighed. Evidently this will depend upon the distribution of accidents according to gravity or severity. The statisticians of the Wisconsin Industrial Commission, who have endeavored to compute a few law differentials, recognize this, and use the distribution of accidents in Massachusetts and in Wisconsin adding the data together, and obtaining a total of some 115,000 accidents. But while the results obtained were fairly satisfactory this method suffers from all the shortcomings of the statistics used. Massachusetts included all notices; Wisconsin, largely only accidents over seven days' duration. The systems of distribution were different in the two States, and unsatisfactory in either; especially in regard to accidents resulting in permanent disability, are these data faulty, because the condition of permanency cannot be ascertained in the short time within which both Massachusetts and Wisconsin data were compiled. Furthermore, in regard to several problems, such as the number of dependents or the influence of limits, no information at all was available.

At this point the usefulness of the "Rubinow hypothesis," or "Rubinow Law" came in. Briefly, it may be stated thus:

Given a sufficiently variegated industrial activity, the distribution of accidents according to their physical results will be fairly uniform anywhere.

With the help of this hypothesis, the following method for computing law differentials was agreed upon:

Construct a standard accident table, showing such distribution by severity in all necessary details. Compute the value of compensation for this standard series under any law, and the ratio of this cost will be the law differential. As the basic premiums were thus obtained from Massachusetts experience, the Massachusetts value of the table was the basic for computing differentials.

The first step in this method was the construction of the standard table, a duty which I was fortunate enough to be entrusted with.

Popular fancy is a very mysterious thing. One never knows what may or may not please it. The 100,000 accidents of the Standard Table have quite unexpectedly for its author acquired quite a little reputation for themselves. Both the roundness and the bigness of the number seemed to impress popular imagination. In his article in the "Survey," Mr. Benedict speaks of them as 160,000 accidents actually gathered from European experience. As a matter of fact, that is not accurate. The 100,000 is simply an extension of the percentage method. It seems preferable to use whole numbers rather than decimal fractions, carried out three

[1] The Committee consists of Mr. B. D. Flynn, Assistant Secretary of the Travelers Insurance Company; Mr. Stanley L. Otis, Actuary of the Workmen's Compensation Service Bureau; Mr. C. E. Scattergood, Assistant Secretary of the Fidelity and Casualty Company, and the writer.

places beyond the decimal point. The large number seemed necessary in order to permit their distribution in sufficient detail. The entire statistical material used in its preparation is too voluminous for presentation here. It is hoped that it will be possible to publish it in some other form. Moreover, the details are of purely statistical and of slight actuarial interest. It is sufficient to state that statistics of accidents in Germany, Austria, France, Belgium, Italy and Russia, in Massachusetts, Washington, California, and other States was utilized in this connection. The total number of accidents included in the data analyzed literally runs into millions. The following questions require an answer (in each case per 100,000):

1. The number of fatal accidents.
2. The number of cases of total permanent disability.
3. The number of dismemberments, distributed according to their exact nature.
4. The number of cases of permanent partial disability, other than dismemberments.
5. Their distribution according to degree of impairment of earning capacity.
6. The number of cases of total temporary disability.
7. Their distribution according to duration of disability (by weeks intervals).
8. The duration of total temporary disability in cases which result in dismemberments, or in other forms of permanent partial disability.
9. The number of fatal cases leaving total, partial or no dependents.
10. The number of widows, children, or other dependents surviving in those States where the death compensation is made dependent upon the number or kind of dependents surviving.

Briefly the standard table accepted by the committee embodies the following facts:

Fatalities	932
Total permanent disability	133
Dismemberments	2,300
Other permanent partial disability	2,442
Total temporary cases	94,193

Before any criticism of this distribution is offered, it is very important to remember that almost for the first time in American statistical literature, it has been based upon a very definite interpretation of an accident. This definition adopted by the Statistical Committee of the Bureau, and promising to become the standard definition through the United States, excludes all accidents where the injured person loses no time except on the day of injury; and according to the Massachusetts report, some 40 per cent accidents reported are of such trivial character. Naturally this increases the proportion of the serious accidents in the table.

To return to the actuarial problems. The standard table, or the 100,000, were taken through the mill of the compensation law of each State. Since the benefits almost universally are stated in proportion to week's wages, it was found convenient to utilize week's wages as a unit of measure rather than dollars and cents. It is but fair to add that in this the Committee utilized the precedent established by Mr. Greene. In a few cases where the benefits are measured in money units, it was therefore necessary to recomverse these into week's wages by an assumption of an average weekly wage. That was true of funerals and medical aid. Where long term payments are granted it was decided to utilize commuted values in the computation. Since a true differential between States was required, it did not seem scientific to disregard the factor of computation, especially because in certain acts and for certain benefits the facts of mortality had to be taken into consideration. Annuities certain were used where the provisions of the law made probable that the total benefits would be paid to dependents even if one of them died during the time. Term annuities were used in most cases; life annuities where life pensions were granted, and deferred annuities in a few cases where the benefits consisted of a preliminary larger, and a deferred smaller annual amount. The effect of limit was measured by obtaining statistics of wages of injured persons and computing the cost of compensation both with and without limits.

For the computation of the cost of medical aid, no theoretical method presented itself, but fortunately experience data as to proportion between compensation and medical cost were available for a few States, and from these fairly reasonable estimates could be made for other States with slightly different provisions. The methods as thus recited appear complex. The Committee would readily admit that they are not simple. While the computation of the first State differential took nearly a week, recently two differentials were computed in one day, and that, we feel, is a record that cannot be very much improved upon. Are the rates based upon these differentials absolutely right? That is the question that is most likely to be asked. No one is so little inclined to make this claim as the Committee. Yet I am sure that I voice the conviction of all its members in stating that barring possible individual errors, the rates are, on the whole, the most scientific that ever were compiled in this country, and the best that could be compiled with the material as yet available.

While I am willing to stand by this claim, I am equally convinced that they are temporary only, and that possibly in two or three years, a complete revision, or readjustment will be necessary, and also possible, if meanwhile accurate statistical data are accumulated by the casualty companies.

Let us, therefore, frankly, though briefly, enumerate the elements of weakness in the method of rate computation:

1. The Basic Rate. It is a trite observation that a chain is no stronger than its weakest link. As I have explained earlier in this paper, one year's experience in one State is not enough. When the Massachusetts experience, under the older law is revised for the entire period, July 1, 1912-October 1, 1914, substantial changes will be made in most, if not all pure premiums, and further changes may become necessary if the experience of the States are combined.

2. The Law Differential. This may have to be changed somewhat because of errors found in the Standard Table. As soon as records of a few hundred thousands of accident records are carefully studied in this country, the necessity for a hypothetical standard table will have vanished. Personally, I cherish the hope that the errors disclosed will not be very essential. Naturally, I cannot believe that the "Rubinow Law" is all wrong. Yet there are factors in it that are not altogether physical, such as the determination of degree of disability. The California schedule for instance differs materially from the schedules used in Europe, and similar differences between States may develop.

3. The construction put upon certain provisions of the laws may not have been altogether accurate. In a few cases, the Committee was not altogether certain of its interpretation, especially in cases where the Act had not yet gone into effect. It is necessary to add, however, that the members of the Committee carefully watch decisions of commissions and courts as to such interpretations.

4. A bigger problem, however, is the fundamental accuracy of applying the same law differential to all classifications. As already explained, the law differential depends upon the distribution of accidents as to severity. But while such distribution must be

uniform, on the whole, as between one State and another, it differs materially, as between industries. The proportion of accidents resulting fatally, for instance, will be greater in a coal mine than in a clothing shop. Theoretically different standard accident tables should be compiled for each classification, or at least, for each large industrial group. But altogether outside of the enormous labor involved in such an undertaking, there are no data from which such tables could be constructed. We may feel that we have accomplished a good deal in achieving justice as between one State and another, without claiming equal justice between classifications.

5. The Question of Comparative Accident Frequency. That the physical and moral hazard is not equal throughout our great country any one will readily admit, but no one has prepared the necessary material for a convincing measure of the extent of such differences. Most extravagant statements, as to these differences, are often made. It is almost impossible either to prove or to disprove them. In a very few cases small allowances were made for them in establishing rates. To some extent the methods of schedule rating and experience rating recently established will tend to discount these differences. But nothing less than trustworthy accident statistics can settle this question to the satisfaction of all. If errors have been made, their cost is but the inevitable price of obtaining valuable business experience.

6. Finally, we must come back to a point mentioned earlier. The basis of a true rate is the basic pure premium, and yet for most classifications no one State can ever expect to have sufficient experience to produce a true pure premium. Compensation rates throughout the country cannot indefinitely be depended upon Massachusetts pure costs. Moreover, compensation rates in Nebraska cannot depend upon pure costs in Nebraska only, nor rates in Maryland upon Maryland costs. For each classification the experience of the entire country will have to be utilized. In so far as this experience is physical, and expressed in terms of accident frequency and severity, it will be adopted to universal use. And in so far as that experience is expressed in dollars and cents, the methods of law differentials will enable us to bring together accidental losses in all States, make proper allowances for the differences in the law, deduct a basic pure premium from them, and from that basic pure premium, derive pure premiums for each State which may differ materially from the actual costs in these States, and yet represent a truer measure of hazard.

Time does not permit me to go into the further details of this larger plan, which is premature at the present moment, anyway. But the statement cannot be made too emphatic that while the present rates may be the best that could be, their subsequent improvement depends entirely upon the development of accident statistics. The Bureau's careful and comprehensive plan, recently adopted, is well known. We actuaries and statisticians, we all look forward to its realization. Perhaps the casualty companies do not quite realize it yet. The plan may call for a study of 500,000 accidents annually, and that represents a comprehensive statistical undertaking requiring a substantial force and an efficient statistical office. But it annually more than repays the results, and no other body is likely to furnish them. We hope that the industrial commissions and bureaus of industrial English these data has been cherished by many. But a careful analysis of the reports as yet turned out by Massachusetts, Wisconsin, California, Washington, Ohio and other States shows the same, at least for some time. Each one of these reports is interesting and to some extent valuable, but an effort to bring them together produces a maze of dissimilar data, absolutely barren of any tangible actuarial results. Given the political organization of our country, a statistical union of casualty business is as yet the only hope of valuable statistics. It should be the function of our young organization to see that the qualitative results of such co-operation should be worthy of the effort and expense required in its realization.

THE INVESTMENTS OF LIFE ASSURANCE COMPANIES

By P. C. Crump, F. I. A.*

(Continued from Page 592)

THE amount of money invested in British Government securities reached its highest point in the year 1902, when it approximated to 2½ per cent, as against 1⅛ per cent at the present time. The actual decline in the gross figures during the same period is about a million sterling, but I think it can be safely said that a very large portion, if not the major portion, of this reduction is due to the automatic writing down of book values to bring them more into line with market quotations. It is, of course, dangerous to prophesy, but at the same time it does seem as if this percentage is destined to fall still further in the near future, and the reason is not far to seek. Even at their present low level, Consols yield but £3 9s. 0d. per cent, and other British guaranteed stocks only a little more. In the present state of competition, and the public demand for substantial rates of bonus, it is difficult to see how a company can afford to purchase any appreciable amount of such comparatively unremunerative securities. Formerly, Consols were largely held because they partook of the nature of liquid securities, and it was one of the generally accepted canons of investment that a certain amount of the funds should be invested so that they could be readily realizable, i. e., command a free market. Unfortunately, as has been pointed out by more than one authority, Consols have largely lost this attribute, and nowadays, except on special occasions, such as when the Government broker is buying for the purposes of the Sinking Fund, it is not by any means an easy thing to sell a large block without disturbing the market price.

Indian and Colonial Government stocks recorded their highest percentage of 7½ per cent about the year 1894, and then gradually dropped to about 5½ per cent in 1906. Since that date, however, there has been an upward tendency and the present proportion is 8 per cent. It is not the custom of the Board of Trade to discriminate between Government and Provincial securities in the published returns, and to this fact I think the improvement can be assigned. There has been a very large increase in the amount of loans raised by the Canadian Provincial authorities in the last few years, and, as the interest yield is about 10s. per cent in excess of that of the direct Government issues, such investments have naturally proved rather the more attractive. Moreover, an extra two or three shillings per cent can be obtained if an unquoted dollar issue is purchased; e. g., quite recently $250,000 4 per cent bonds of the province of Ontario were being offered in London at about 91 per cent, at a time when the 4 per cent Registered Stock quoted in the Official List stood at 94 net. These unquoted bonds are, of course, quite suitable for large investors such as insurance companies, but unsuited to private individuals of limited means.

The percentage of funds invested in Foreign Government Securities has shown a steady and continuous increase for the past 25 years, and at the present time it stands at over 6 per cent. Compared with some groups, the totals are still rather small, but the constant demands for capital by the various governments, and

A paper read before the Insurance Institute of Sheffield. It should be borne in mind that some months have elapsed since this address was delivered, and that the advent of the war in Europe has materially altered the actual financial situation, although the fundamental value of the article is unimpaired.

the very remunerative rates offered, have proved too attractive to be resisted, and there seems no doubt that in the future the percentage will continue to grow. The costly wars of the last fifteen years are largely responsible for this feature, but in addition the general levelling of credit has to be taken into account. It is not so long ago that the securities of the South American republics were looked at askance by most companies, but now the loans of such States as the Argentine, Brazil and Chili are largely bought. Well over 5 per cent can now be obtained from these countries, and, provided the sums so invested are limited, no undue risk is incurred. Some companies, I believe, apply a certain portion of the interest (i. e., over a certain specified rate) to writing down their ledger values; at any rate, such a course has frequently been advocated.

Debentures represent a somewhat cosmopolitan group, and consist of prior charge stocks and bonds of almost every section of market securities. Among those included are Home, Foreign and Colonial Railway Debentures, American Railway Gold and Sterling Bonds, Commercial and Industrial Companies' Debentures, and all forms of Public Utility Bonds; and it is, of course, due to the large variety of investments, having little or nothing in common with each other, which are brought together under this one head, that its progress has been so marked. Between 1890 and 1911, the percentage to the total has risen from 10 to 24, a remarkable appreciation when the increase in the total amounts invested during the same period is remembered, and one which has had the effect of making this the largest section required to be separately set out for the Board of Trade returns. It is the custom of a large proportion of trading companies who are in want of money to raise capital by means of an issue of debentures secured on the freehold or leasehold property owned, instead of by way of an ordinary mortgage as was formerly the case. The result is that there are a very large number of industrial marketable debentures to be had, as compared with relatively few, say, 25 or 30 years ago, and loans which would have helped to swell the mortgages figures have undoubtedy been diverted into securities coming under the present section.

The proportion invested in Stocks and Shares attained its maximum of 12½ per cent about the year 1899, since when there has been a steady fall to less than 10 per cent, although the actual amounts so invested have continued to increase. There is, of course, a fairly strong opinion that the funds of a life office should not be employed in buying securities bearing a fluctuating rate of dividend, and the days when Home Railway Ordinary Stocks were regarded as ideal investments for this purpose have long since passed. Included in this group, however, are Guaranteed and Preference Stocks, and it is probably due to the purchase of these that the gross figures have continued to advance in recent years.

As regards Property and Ground Rents, the proportion has now risen to as much as 9 per cent, but I think most of the purchases during the last few years have been on account of money spent in the erection of new head and branch offices for the companies' own businesses. The notorious Finance Act of 1909-1910, and possibly the fear of future legislation, has had a very decided effect on investments of this nature, and incidentally on the rate of interest to be obtained therefrom. Unfortunately, most of the increased rate of interest on new purchases will, I should imagine, have to be used—indirectly, at any rate—for the purpose of writing down the ledger values of the old ones.

There are two other sections to which some reference should be made, although it is impossible to make any comparison with the past, as it is only within the last year or so that the figures have been shown separately in the Board of Trade returns. The groups in question are Colonial and Foreign Municipal securities. Undoubtedly the last few years have witnessed the investment of enormous sums of money at highly remunerative rates in this direction, and a similar tendency will, I believe, continue to manifest itself in the future, as the borrowings by such authorities seem endless, and it is only the present condition of the stock markets which has prevented an even greater flood of new issues than that which we have recently experienced. A very good idea of the way in which capital, originally invested in this country, now goes abroad, can be formed from a comparison of the amounts of new issues floated on the London market during the last three years. The figures, which I have obtained from the "Investors' Monthly Manual," are as follows:

TABLE E.

	1910.	1911.	1912
United Kingdom	£60,000,000	£26,000,000	£45,000,000
British Colonies	92,000,000	65,000,000	72,000,000
Foreign	115,000,000	110,000,000	93,000,000

It will thus be seen that in 1910 only 22½ per cent of the money so raised remained in this country, while in the following year the proportion had sunk to 13½ per cent; in 1912, however, there was a recovery to 21½ per cent, but even this figures is less than half of that attributable to foreign countries, who, it may be argued, have no moral claim on our money.

A second reason for the rise in the interest rate is, I am convinced, largely due to what for lack of a better phrase, I may call "better buying." The time has gone when insurance officials bought as a matter of course whatever their recognized brokers brought to them, and at a price approximating to the top quoted limit, in much the same way as a private individual with a few hundreds of pounds invested his money. Much greater knowledge now exists as to the intrinsic value of investments, and that knowledge is employed to the best advantage. The system now in vogue is much less hackneyed than hitherto, and assurance companies rightly use the strong position they hold, as probably the largest investors in the world, in dictating to some degree the terms on which they are prepared to lend the funds which they hold in trust for their members' benefit. In addition, it is most important to know the best sources from which to purchase; it is no uncommon thing to have the same security offered from several different quarters at widely varying prices, and this is particularly noticeable in the case of American Railway Bonds. Many of these are quoted both in London and New York, and a careful comparison of the two markets must be made before accepting an investment of this nature. Bonds offered at New York terms by various brokers as often as not exhibit a discrepancy, and the advantage of dealing with a number of firms is thus made apparent, as by so doing an office has the best possible opportunity of investing its funds in the most remunerative way and at the lowest prices. I speak from a very considerable experience on this matter, and it is no exaggeration to say that in the course of a year I have come across hundreds of such cases as those to which I have referred. The existence of the middle man has, of course, a good deal to do with it, and, although he is in most cases a very necessary agent, he requires careful looking after, as both in quality and information he varies considerably. To illustrate this, it frequently happens that a large parcel of bonds is offered at what appears to be an attractive level, but it may be that it is due to the holder having notification that a new issue is shortly to be made and wishing to unload so that he can reinvest at the lower figure at which the new bonds will have to be issued. It is essential that this information should also be known to the prospective investor, and the broker, i. e. his agent, should be in a position to supply it;

but very frequently the reverse is the case, with the result that the new holder of such bonds will have the doubtful pleasure of witnessing others subsequently getting in at a lower price than himself. Again, underwriting of new loans by insurance companies has greatly increased in recent years. It is now generally recognized in the market that no better class of underwriters exist, as on the failure of an issue the amount necessary to be taken up is almost invariably held as an investment, and not sold at the first favorable opportunity: this fact naturally has a steadying influence on the market quotation and helps to preserve the credit of the borrower. Where the issue is successful, that is, fully subscribed by the public, the underwriting commission received can then be advantageously employed in writing down the ledger values of similar securities or carried to "Profit on Investments account." If a proper selection is made of the securities offered on underwriting terms, and due regard paid to existing holdings and market conditions, substantial profits can be earned in this direction, and it is but seldom, even in event of a loan being a failure, that the price at which the amount allotted stands in the office books, after deduction of the full commission received, will exceed the market quotation. It is a very good rule, nevertheless, not to underwrite a security which it would be inadvisable to hold as an investment, although such a course is not, I believe, invariably followed by some companies.

I have already briefly dealt with the changes which have taken place in the proportionate amounts held of the respective groups of investments, and the increase in the rate of interest thereby produced. I should like now to refer to a few special classes of security which have contributed to this end.

(1) Mortgages without the United Kingdom.—Although loans on property situated in this country have remained practically stationary, and in many individual cases have actually decreased, there has been a decided tendency for loans in foreign countries and the Colonies to move in the other direction. Such advances are by no means universal, but some companies have made quite a feature of them, particularly as regards such places as Canada. In that country, as is well known, there is a very great demand for capital, and this is largely obtained by means of mortgages. A considerable amount of caution is required in investigating the security for the advance, and it is advisable to have experts on the spot to make independent valuations, if this class of business is to be carried on successfully.

(2) Short Term Securities.—Until comparatively recently it was considered inadvisable for insurance companies to invest any material part of their funds in securities having a short duration, it being held that, as the income was practically always more than sufficient to meet both expenditure and the payment of claims, the available surplus each year should be applied to the purchase of permanent or long term investments, so as to ensure a definite and ascertainable fixed rate of interest. This opinion was almost general and certainly appeared a sound one, but, in view of the falling prices of the last few years, any one holding a contrary view would now be justified in enjoying a quiet chuckle to himself. Those companies which took advantage of attractive offers of short-dated securities, say from one to five years, must have been amply repaid for the course they pursued, — by so doing capital depreciation has to a large extent been avoided, and the money received at redemption has been available for reinvestment at the low prices now ruling. Further than this, the interest yield on this type of security is usually appreciably higher than that on permanent or long term stocks and bonds, so that investments of this nature made during the last ten years or so have been doubly remunerative. The constant fall in prices has, however, somewhat modified the opinions formerly held, and I think there is little doubt that short term investments are now frequently made by insurance offices. The supply, latterly has been abundant, owing to the desire of borrowers to postpone the issue of loans, if possible, until more favorable market conditions have arisen, and consequently only temporary advances have been sought at the existing high rates of interest. Even Colonial Governments have been forced to adopt this method of finance in order that they might subsequently take advantage of any improvement in the markets and to avoid meanwhile impairing their credit. I am afraid that in this case, at any rate, temporary borrowing has not proved altogether successful, and more recently a resumption has been made of the practice of issuing long term inscribed stocks, at prices which but a few years ago would have been considered almost impossible. Another type of this class of investment is that of American Railway Equipment Notes. As the name implies, these are issued for the purpose of paying for locomotives, freight cars and other sorts of equipment, up to a certain percentage of the cost price, generally 80 or 90 per cent. The notes mature, as a rule, serially, a certain proportion being paid off each year, and the maximum period seldom exceeds ten years. As the equipment gradually wears out, so the notes outstanding against it are automatically reduced. At the present time the rate yielded is from 5 to 5½ per cent, which is, of course, highly attractive considering the security pledged, viz., the equipment itself and the obligation of the railway company.

(3) The next group to which I would like to call your attention is that of Foreign and Colonial Municipal Securities. I have already said that it is only in recent years that the Board of Trade returns have shown these classified separately, a fact which suggests their increasing popularity. The obligations of the chief Continental cities provide excellent security and most attractive rates, and many of such bonds are now placed directly on the English market in sterling denominations. Repayment, instead of being at a fixed date, as is generally the case with English municipalities, is in the case of Foreign corporations nearly always by means of a sinking fund applied to periodical purchases in the market, or drawings by lot, so that it is most important to carefully study the exact terms of such redemption in estimating the effect on the interest yield. Colonial corporations approach more nearly to the English variety, except that they are more often in the form of bonds than of stock. Owing to the rapid development of Canada and the ever growing population, towns in the Dominion have been rather frequent borrowers lately, with the result that the rates of interest at which they can borrow have been greatly increased. It has been no uncommon thing for the securities of thriving and well known townships of from, say, 20,000 to 50,000 inhabitants, to be bought to yield as much as 5⅜-5½ per cent, while a case was brought to my notice only a few weeks ago of a block of short term securities yielding as much as 8 per cent. Just at present it is a particularly difficult operation for a Canadian city to place a loan at almost any figure on the London market. Even places like Montreal, Toronto, Vancouver and Ottawa have to pay nearly one per cent more for accommodation than they did two or three years ago.

(4) Finally, I should like to make a short reference to Public Utility Bonds, which for some time past have been attracting increased attention from both the English and American investor. There are several factors contributing to the progress of companies transacting Public Utilities, which are due in some part to the economical and social developments which are taking place.

(Continued on Page 636 of this issue.)

FINANCE AND COMMERCE

Financial and Commercial Review.
Banking Situation at Home and Abroad.
Statistics of Cotton and Coffee.
Market Prices of Securities and Commodities.

THINGS have begun to happen this month in the world of finance, important things, and for the most part auspicious for American affairs. November is likely to pass into history as a landmark in the economic situation which the European War created. Before the end of the month the Interstate Commerce Commission should hand down its decision in the Eastern rate case. By that time the cotton exchanges will apparently have been restored to normal working order and the Federal Reserve Banks will have been operating for a fortnight. A great deal of moment attaches to the inauguration of the reserve banking system scheduled for next Monday, and it would not be surprising if the enlarged financial facilities thereby afforded make a great contribution to a movement for reopening the stock exchanges.

This, however, is a matter which banking interests are as yet reluctant even to talk about, although all the signs of the securities market to-day are propitious for a resumption of more or less regular dealings. Prices have been recovering in the irregular street market for listed stocks. Ever since the election provided an impulse to reviving confidence, investment transactions under official scrutiny have broadened at an improving level of quotations. The market for short time notes is on a basis of yield ranging from about 4½ per cent for the new issues of New York City to 5½ and 6 per cent for the obligations of railroads and industrial corporations. In the past week the Stock Exchange authorities have decided that they could safely remove the embargo on price restrictions for trading in unlisted stocks, the principal markets for which is represented by the Broad Street curb organization, and the stronger quality of financial sentiment was strikingly indicated by the lifting of the ban on the publication of prices made in the market for unlisted shares.

It is far too early to say that the great problem presented by the menace of foreign liquidation of securities is so clearly in the way of being solved that the early reopening of the stock exchanges can be predicted. Nevertheless, recent occurrences have all suggested that the automatic processes by which the financial world has been regaining its equilibrium may conduce to a complete restoration of the financial machinery in all departments. There is great danger of course that a mere rebound of relief from the excessive strain may be mistaken for a definite trend of values, and unless prudence controls financial action a reaction may be invited which will be extremely depressing. Words of truth and soberness were uttered by the Federal Reserve Board when, in putting out its general regulations to govern the rediscount operations of the reserve banks, it said: "No one can estimate the duration of the war, nor predict what will be the financial or commercial conditions when peace will be restored."

It is so difficult for us to realize at our distance from the seat of conflict what a terrific tragedy economic and otherwise the war is that we are overmuch inclined to consider our prospect as though Europe's calamity lacked dire significance for ourselves. If it is kept in mind that the whole world, neutral or not, is engaged in the ruin which is being wrought abroad, our American optimism will be tempered as it should by a recognition of the fact that for a long time to come the prosperity which we can achieve must be necessarily relative.

We may, however, find reasons for a reasonable optimism in the latest events. So far as the war itself is concerned the military situation seems increasingly adverse to Germany, and despite the counsels of neutrality, the prevailing conviction here is that our interests lie in the direction of Allied ascendancy along with our preponderant sympathies. Whether or not the outlook is for a shorter duration of the war than has been counted upon is a question, but the British Prime Minister would not be apt to speak as Asquith did the other day when he uttered doubts of a prolonged struggle unless he had weighty facts on which to base his conclusions. It may be indeed that Germany has already begun to fight only for a foothold in the eventual peace negotiations, and it is not improbable that developments in the war are more than anything else responsible for the salient occurrence of the past week, the violent decline in all forms of foreign exchange remittance quoted in the Wall Street market.

While Secretary McAdoo and Sir George Paish have been conferring about no one knows what and have been causing by their discussion a preposterous emission of Washington despatches relative to projects for fixing up the international financial position, the money market has been taking care of itself in its own way. It may be that Sir George Paish has been conducting negotiations only with regard to the time when foreign exchange should turn so strongly in our favor that we could make a great demand on Great Britain for the export of gold back to us. He may have had in mind only the advantage which could offer then if British finance were able to say that one good turn deserved another, and to point to the moderation exercised when our affairs were in a most difficult stage in the first three months of the war and the magnitude of our foreign indebtedness was keeping our bankers and business men awake o' night.

Whatever Sir George Paish and Mr. McAdoo have been talking about, forces have been working without any artificial interference and as a result sterling exchange is almost at a normal level. No longer can it be said that gold commands a premium in our market because of the pressure of foreign creditors for payment at the principal centres where American external obligations fall due. French exchange is also practically at the normal, while all other varieties of continental remittance, German marks, Austrian and Danish kronen and Italian lira are profoundly weak. The great weakness of German and Austrian exchange denotes a consensus of financial judgment that the cause of the two Kaisers is hopeless and finance apparently endorses military judgment about the portents of the war.

All of these turns of foreign exchange in our favor have been in prospect for several weeks past. Foreign exchange bankers began to be satisfied two months ago, when our export trade started to recover under the heavy purchases for belligerent and neutral countries alike, that it would be only a question of time before American finance would hold control of the international money market. There is only to be guarded against now the risk that exchange may turn too strongly in favor of the United States. An abnormally low level for foreign remittance would have disrupting and deranging effects in the banking and business community quite as far reaching as, though less serious than abnormally high rates for remittance. Among other things it would accelerate foreign liquidation here both of goods and commodities and complicate our export trade situation.

Headway at last made by the British and Allied naval forces in clearing the seas of German commerce destroyers has been reflected in a fall in marine insurance charges. Great Britain has also avowed a disposition to encourage trade between neutral countries, and our export trade prospect is brighter again. With the restora-

loss of the future market for cotton the shipment of this great staple of American commerce must make a further recovery toward [illegible] proportions. Incidentally it might be noted that the approach toward the opening of the cotton exchanges seems practically to have killed the project known as the cotton loan fund, which was never at any time an indispensable requisite to the rehabilitation of the cotton market. Domestic trade is still greatly contracted, the depression being impressively evinced by the surplus of idle freight cars which, according to the latest report, is the largest for this season since 1907. Still the feeling is spreading in business circles that for the time being, anyway, the bottom of depression has been pretty nearly reached, and that business in the near future is likely to mend somewhat.

In anticipation of the larger capacities for credit which will be afforded with the opening of the Federal Reserve Banks, the domestic money market has in every direction given signs of increased relaxation. This is shown more by the liberal disposition of bankers to grant credit than by the change in quoted rates and for that matter it is to be hoped that the reserve banking system will not induce any great money market weakness. It will not, if the policy of the Federal Reserve Board is effective.

This policy was enunciated in the rules framed to govern the rediscounting business of the Federal Reserve Banks, and the statement which the Federal Reserve Board issued on this subject is a remarkably encouraging document. It shows among other things that the Treasury conceptions of finance under the McAdoo administration are not subscribed to by the Board, which has set its face sternly against any idea that what is wanted is cheap credit and plenty of it. The regulations which the Board has framed are obviously intended to make a beginning of the conversion of the American commercial paper market from one of accommodation paper to one of real bills of exchange and the warning given by the Board against processes which will make the money market too easy, implies that efforts will be made to prevent anything resembling monetary inflation. If the Federal Reserve Board has its way the new banking system will increase the country's financial strength, but not by any contrivances to promote a hectic and artificial display of strength.

New York	[illegible]	49	48¼	47⅝		
London	[illegible]	22⅞	22½	22 5-16	22⅛	

COTTON

November 14, 1914.

INTERMISSION of trading in contracts for the future delivery of cotton upon the great cotton exchanges is approaching its term. Since July 1 there has been no buying and selling of cotton for future delivery, at public outcry, under the rules of the exchanges, until the present week. Some private transactions have taken place, with the exchange rules governing the contracts made between individual members, but of general trading there has been none. This week the Liverpool Exchange has inaugurated general trading in all deliveries from May-June, 1915, on, with the single restriction that sales must not be made below 4.25d. per pound. That market acted well on the whole and until the end of the week prices ruled well above the stipulated minimum. The volume of transactions is reported to have been surprisingly large, considering the long interregnum and the inability of most Continental customers even to reach Liverpool with orders. On this side of the water, the members of the New York Cotton Exchange have been wholly absorbed during the week in completing the arrangements for re-opening on Monday, November 16. Ample provision has been made by unselfish co-operative effort to safeguard the interests of all the members, and to take care of the considerable amounts of contracts left open on July 31 for the account of customers at home and abroad whose financial condition was weakened by the stunning blow of the outbreak of a general war in Europe. The leading bankers of New York, and indeed still other leaders of the entire financial district of New York have participated in the work of reconstruction and reorganization. Hence, the New York Cotton Exchange will be able to reopen for normal business on Monday next, without fear of disturbance and distress. It is understood that the New Orleans Cotton Exchange will resume business on the same day. Perhaps no more interesting document can be quoted in this connection than the notice issued yesterday by the Board of Managers to the members of the New York Cotton Exchange. It is as follows:

New York, November 13, 1914.

To the Members of the New York Cotton Exchange:

Dear Sirs:—The Board of Managers has ordered that the Exchange be re-opened for business on Monday, November 16th, at 10 o'clock a. m.

In connection with the re-opening of the Exchange, the Board of Managers desires to call to the attention of members that the recent changes in the By-Laws and Rules have provided for a new style of contract based on the existing Government Standard. Trading in the "new style" contract will be for January delivery and later months only.

The Inspection Bureau is now prepared to certificate cotton under the new standard, and the Board of Managers considers it for the best interest of the membership that our stock of cotton based on the old standard should not increase. The Board of Managers, therefore, asks that each member will discourage the bringing to New York for delivery on the old standard any cotton excepting in fulfilment of sales already effected, and it further asks that members will accept no orders in the "old style" contracts excepting in liquidation.

Trading on calls until further notice, will be in the following order:

NOVEMBER.....Old Style Contract
DECEMBER.....Old Style Contract
JANUARY.....New Style Contract
JANUARY.....Old Style Contract

and so on until May, inclusive, after which only "new style" will be called. All trades, excepting on call, will be presumed to be in "new style" contracts, unless otherwise specifically stated. In order that there may be no question as to a contract conforming to the provisions of the United States Cotton Fuures Act, members will please see that all their contract slips for "new style" deliveries beyond January are stamped "and subject to the United States Cotton Futures Act, Section 5." Please instruct your clerks to be sure that this wording is on all such contracts before they are signed; also, to avoid confusion, mark your "old style" contract slips distinctly.

In accordance with the Rules of the Exchange the Board of Managers has designated the following banks and trust companies as depositories for margins:

Corn Exchange Bank	Bankers' Trust Co.
National City Bank	First National Bank
Central Trust Co.	Hanover National Bank
Bank of New York	Chase National Bank
Mechanics and Metals National Bank	National Bank of Commerce
Bank of America	Guaranty Trust Co.
Bank of Manhattan Co.	National Park Bank
	American Exch. National Bank

Yours very truly,
ELWOOD P. McENANY,
Secretary.

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	456,235	570,419	491,246	342,138
Overland to mills and Canada	43,687	49,099	54,290	48,040
So. mill takings, est., exclusive of takings from Southern ports.	90,000	90,000	90,000	75,000
Gain of stocks at interior towns	38,864	26,624	61,210	92,420
Brought into sight for week	628,786	736,142	696,746	557,598
Total Movement—				
Port receipts	4,737,659	4,712,604	4,736,609	2,019,191
Overland to mills and Canada	210,962	209,036	283,073	185,860
Southern mill takings	832,032	805,873	844,796	498,000
Stocks at interior towns in excess of Sept. 1	595,587	445,495	445,897	803,711
Brought into sight thus far this season	6,376,240	6,173,008	6,310,675	3,506,762

The total crop movement is respectively for 109 days, 107 days, 106 days and 105 days.

BRITISH BOARD OF TRADE OFFICIAL EXPORT FIGURES

The preliminary figures for the October exports of cotton yarns and cloths from Great Britain have been received by cable by the New York Cotton Exchange. We give them below, with the completed figures of the months since October 1, 1913:

	Yarns, Pounds.		Cloth, Yards.	
	Month.	Since Jan. 1.	Month.	Since Jan. 1.
1913.				
1913—October	19,959,100	174,720,800	630,937,100	5,981,216,300
1912—October	22,515,500	207,614,800	666,185,300	5,789,310,200
1913—November	18,247,000	192,968,400	563,650,100	6,544,866,100
1912—November	18,025,000	225,640,000	568,945,600	6,358,255,800
1913—December	17,207,100	210,175,500	530,692,300	7,075,558,400
1912—December	18,314,300	243,954,300	554,370,000	6,912,625,800
1914.				
1914—January	19,056,000	19,056,000	688,105,100	688,105,100
1913—January	19,093,300	19,093,300	648,912,700	648,912,700
1914—February	18,074,100	37,130,100	583,451,600	1,271,556,700
1913—February	16,761,100	35,854,400	563,606,400	1,212,519,100
1914—March	19,824,300	56,954,400	590,375,000	1,861,931,700
1913—March	17,212,600	53,067,000	560,905,000	1,773,424,100

The Price of Cotton in Germany as Affected by the War.—The United States Department of State is in receipt (November 3) of a cablegram from the American embassy at Berlin stating that the supply of cotton is about sold out in Bremen, which is the principal cotton market of Germany. Small quantities of good middling are being quoted at 85 pfennigs per half kilo (18.352 cents per avoirdupois pound). Two weeks ago the figure was 72 pfennigs (15.546 cents per pound), and four weeks ago 68 pfennigs (14.682 cents per pound). A price of 57 pfennigs per half kilo (12.307 cents per pound) is offered for new-crop fibre, but quotations will naturally be influenced by the quantity arriving. At Hamburg spot cotton is quoted at 90 pfennigs (19.432 cents per pound) and 85 pfennigs (18.352 cents per pound) offered for later delivery, with a drop in price likely should new cotton arrive in quantity.

In the interior of Germany—at Stuttgart and Munich—the price is 1 mark per half kilo (21.591 cents per pound); at Magdeburg, 72 pfennigs (15.546 cents per pound); at Coburg, 60 to 65 pfennigs (12.955 to 14.034 cents per pound) for cotton coming by way of Genoa or Swedish ports; at Cologne, 78 pfennigs (16.841 cents per pound) delivered at Cologne; at Dresden, 75 pfennigs (16.193 cents per pound), this being the quotation on October 17. In Leipzig prices range from 66 to 107 pfennigs per half kilo (from 14.25 to 23.102 cents per pound), free Leipzig, according to quality.

For comparison it may be stated that on approximately the same date (November 2), the average price of spot middling cotton in the twelve principal active markets of the United States was 7.02 cents per pound, while in Liverpool the price for middling spot was 4.80 pence per pound.

FOURTH COTTON GINNING REPORT OF THE SEASON.

On Monday, November 9, the Bureau of the Census issued its fourth report of the season on cotton ginned from the American crop of 1914-1915. The figures cover the period from the beginning of the season up to November 1. The following table gives the returns by States, with comparisons for last year and for the large crop year, 1911:

COTTON GINNED FOR SEASON TO NOVEMBER 1.

States.	1911, Bales.	1913, Bales.	1914, Bales.
Alabama	1,083,737	1,015,788	1,068,596
Arkansas	444,401	431,522	574,982
Florida	56,070	47,315	56,645
Georgia	1,908,764	1,605,506	1,763,240
Louisiana	232,245	222,464	297,910
Mississippi	584,199	568,005	668,756
North Carolina	597,940	384,260	428,362
Oklahoma	554,933	536,303	658,211
South Carolina	1,022,614	846,468	910,403
Tennessee	211,128	174,379	172,718
Texas	3,211,572	2,950,444	3,170,025
All others	58,302	46,942	58,847
United States	9,970,965	8,830,396	9,828,695

The amount of cotton ginned from October 18 to November 1, inclusive, was 2,207,114 bales, as compared with 2,212,284 bales ginned in the same period in the season of 1911-1912, or practically the same. Included in the figures for this year were 22,976 round bales (taken as half-bales), as compared with 61,577 last year, 54,539 in 1912, and 68,313 in 1911. Sea Island cotton included

THE COFFEE MARKET

NEW YORK COFFEE EXCHANGE.

The following was the closing bid price for each active delivery on July 30, 1914, in cents and hundredths of a cent per pound, net weight:

	Thurs.
July	....
August	6.56
September	6.70
October	6.80
November	6.90
December	7.00
January	7.06
February	7.12
March	7.19
April	7.25
May	7.30
Spot	6⅜

amounted to 43,331 bales, compared with 42,084 bales last year, 28,887 bales in 1912, and 56,563 bales in 1911.

The average quantity of cotton ginned prior to November 1 in the last seven years was 8,050,715 bales, or 63.5 per cent of the average of the seven crops.

NEW YORK COTTON EXCHANGE TO HAVE A CLEARING ASSOCIATION

AFTER the closing of the New York Cotton Exchange on July 31, by reason of the demoralization of business caused by the European War, the members of the Exchange found that not only had they to provide measures of relief and insurance against further harm in connection with the great mass of outstanding commitments left hanging in the air, so to speak, but that there were also important changes and readjustments which should be made before the Exchange resumed operations. As is well known, one of these changes was that of the form of contract employed between members, in order that the provisions of the new United States Cotton Futures Act (Lever Act) might be met,—it being desirable that when this Act goes into effect on February 18, 1915, the trading on the Exchange should already be in essential conformity with the terms of the statute. The work of making this change has been substantially completed, and would have been actually completed, if definitive rulings on numerous points had been made by the Secretary of Agriculture and the Secretary of the Treasury. Even so, it is believed that the form of contract put into effect for all new business, when the Exchange opens (probably on Monday, November 16), will require only the slightest changes when the Government decisions have been arrived at.

A second important change, whose desirability was brought home to members by the events of the last days before the closing of the Exchange, is in respect of the clearing of contractual obligations between members. Heretofore, neither of the American cotton futures exchanges nor the Liverpool Cotton Association has had a Clearing House for members' contracts, in the proper sense of that term. The two important exchanges on the Continent of Europe, Havre and Bremen, have had clearing houses, or liquidation bureaux (*caisses de liquidation*); but the method of organization and operation of these institutions has seemed somewhat foreign to the commercial habits of English and American cotton merchants, who have been solicitous of preserving their direct contractual relations, one with another, and have been averse to having a third party, the clearing house, intervene. The nature of a clearing house for contracts for future delivery is necessarily widely different from that of a stock exchange or bourse clearing house, inasmuch as those purchases and sales of securities which are cleared are for immediate delivery, and the clearing is not essentially different from that of a bank clearing house. Where, however, there is no immediate delivery, but the trading is in contracts for future delivery, so that the consummation of the contracts is spread over many months in the future, the clearing arrangements must be such as to preserve the identity and validity of these contracts until their maturity. Hence, a clearing house for future contracts requires much more complicated machinery than a stock exchange clearing house, and implies an entirely different legal status. The only adequate method to pursue in the contract clearing house is to have the clearing house itself, through substitution, become a party to all contracts entered into between members of the exchange. On the other hand, great advantages to all members are derived from such an arrangement, particularly in the matter of the insurance of solvency which comes from the ability of the clearing house to deal singly and directly with any member inclined to over-extension of his operations.

The members of the New York Cotton Exchange, at a meeting held on Wednesday of this week, agreed to a tentative plan for a Clearing House Association and requested the Board of Managers of the Exchange to proceed at once to the reduction of the plan to workable shape in detail, and to its speedy adoption. The matter is of such importance, not only to the members of the Exchange, but also to all those who deal with them,—i. e. customers, bankers, etc. —that the tentative plan, as approved at Wednesday's meeting, is here given in full.

* * *

TENTATIVE PLAN FOR NEW YORK COTTON EXCHANGE CLEARING ASSOCIATION.

1. **Name:** The name of the Association to be the New York Cotton Exchange Clearing Association.

2. **Object:** The object of the Association shall be to facilitate the clearing of contracts for future delivery of cotton between the members of the New York Cotton Exchange and the furnish protection to the individuals and firms which carry such contracts.

3. **Form of Corporation and Capitalization:** A corporation of 200 or more shares at $10.00 par value for each share, one share to be owned by any member of the New York Cotton Exchange desiring to clear contracts through the Association and agreeing to abide by all of its rules and regulations.

4. **Management:** The management to rest in five directors elected by the shareholders, two to serve one year, two to serve two years, and one to serve three years, and at the expiration of the various terms successors to be elected for a period of three years. Any vacancy caused by resignation, death or otherwise, to be filled by the remaining directors for the unexpired term.

In order that the control of the Association shall continue to rest in the hands of only those members who clear contracts, each shareholder to assign his share in blank to the directors of the Association, and to agree in writing that the directors shall sell his share at par at such time as he may:

(a) Discontinue clearing and withdraw his guarantee;

(b) Form a partnership with another shareholder or shareholders, in which case one of the shareholder members of the firm shall be designated as the member of the Association, and the remaining share or shares shall be disposed of through the directors;

(c) Discontinue for any reason his membership in the Exchange.

5. **Membership:** Membership in the Association shall be open to any member of the New York Cotton Exchange who is in good standing, or to any firm one of whose general partners is a member in good standing of the New York Cotton Exchange, who or which shall have a business office within one-half mile from the New York Cotton Exchange building, and shall deposit with the Association a certified check for $15,000 in New York Funds; and shall buy from the directors one share of stock at $10.00 par value per share, provided he or they agree to comply with all the rules of the Association.

6. **Guaranty Fund:** A deposit of $15,000 from members shall be made and kept in New York City depositories approved by the Directors and shall constitute a fund to secure prompt payment of claims arising by reason of the failure of any Clearing Association member, pending the determination and collection of such failed member's indebtedness, and for the general purposes of the Association.

7. **Method of Clearance:** All contracts for future delivery of cotton made between members of the Association and recognized by the New York Cotton Exchange shall be cleared through the Asso-

ciation, which shall become a party to such contracts by assuming the position of buyer to each seller and seller to each buyer, always, however, retaining the integrity of the original contract and the ultimate responsibility of the original contracting parties until the final completion and fulfilment of the contract. Members shall make daily reports to the Association in accordance with rules prescribed by the Association, and shall accompany such reports with such check or draft as may be necessary to mark outstanding contracts to the last closing bid prices, and with check for original margin as hereinafter prescribed.

8. Fees: Fees shall be charged to members on the basis of 10 cents for each contract cleared. This rate shall be subject to change by the Directors.

9. Surplus: The earnings of the Association shall be used to defray its expenses, and any balance remaining after such expenses have been paid shall be placed in a Surplus Fund.

10. Original Margins: (a) Each member shall maintain a deposit as original margin upon his net interest with the Association (either bought or sold, as may appear each day) in amount not less than is prescribed in the following schedule:

Upon a net interest of 50,000 bales or less.....	$3.00 per bale
Upon a net interest in excess of 50,000 bales, but not over 100,000 bales, upon such excess.....	4.00 per bale
On all contracts in excess of 100,000 bales.....	5.00 per bale

When, in the opinion of the Directors, additional margin is deemed desirable, they shall, upon twenty-four hours' previous notice, declare that all members shall keep with the Association an original margin of not less than $5.00 per bale on their total net interest with the Association. When once declared, this $5.00 marginal basis shall remain in force until withdraw by the Directors.

(b) In addition to the margin required above on the net position of each member with the Association, an original margin of 50 cents per bale on each month will be required on all straddles between months.

When the Directors consider that any increase in a member's commitments with the Association might be hazardous or against the best interest of the Exchange, the Directors may, after examination, fix a maximum beyond which such member shall not be allowed to extend his open contracts with the Association; or it may require an additional margin of not over $10.00 per bale on all excess over said maximum, as it may deem wise,—subject to the right of appeal to a proper committee within twenty-four hours.

Original margins, as provided above, shall be deposited in any of the banks or trust companies approved by the Directors. Checks for such margins shall be made payable to the selected depository and shall be attaced to the Clearing Sheet. The Association shall then deliver such checks to the respective depositories and shall receive and hold until released, margin certificates payable to the order of the Association or the depositor, as the Superintendent of the New York Cotton Exchange may direct. Receipts for such margins shall be given to the depositor by the Association.

Margins which are no longer required shall be released by the Association.

11. Variation Margins: The Directors may, in their discretion, require additional deposits with the Association, to meet variations in the market at any time during the day, under such regulations as they may establish.

12. Defaults: Any member who fails to meet his obligations to the Association, or whose suspension has been announced from the rostrum, shall be considered in default, and the management of the Association shall cause all open contracts of such member with the Association to be promptly closed on the floor of the Exchange. If such member in default is unable to meet immediately any deficit to the Association resulting from the closing of his contracts as above, advice of such inability shall be immediately communicated in writing to the Superintendent of the Exchange. Any loss to the Association resulting from the closing of a member's contracts, as above, shall be paid, as far as possible, out of the available surplus of the Association, and any additional loss shall be assessed against the members of the Association as follows: Fifty per cent thereof shall be assesed pro rata against each member of the Association; the remaining 50 per cent shall be assessed against members of the Association in the proportion that the net amount of their contracts originally made with the failed member, not fulfilled or settled in months not yet matured, bear to the total amount of contracts liquidated at a loss; but, only members shall be assessed whose net contract interest is on the opposite side of the market from that interest liquidated at a loss for the account of the failed member. If it has been necessary to assess members as above provided, the Directors shall impose an additional clearance fee, to be levied on all clearances and to be credited to a special surplus account. From this special surplus account shall be paid: (1) amounts contributed pro rata by members of the Association, and (2) the amounts contributed by members on the basis of their original net contract interest. As soon as this total amount has been raised, the additional clearance charge shall be discontinued.

13. Transferable Notices: Whenever a member desires to deliver a transferable notice against a contract to which the Association is a party, he shall obtain from the Association the name of the member to whom such notice shall be delivered.

THE INVESTMENTS OF LIFE ASSURANCE COMPANIES

(Continued from Page 628.)

These may be summarized as follows: (1) The towns in both countries, but especially in America, where the population of the average city doubles itself in from twenty to thirty years. (2) The higher standard of living: this is reflected in the greater consumption of gas and electric light per head, the former of which was at one time in great danger of being superseded by the latter; but the coming of the incandescent burner and the more general use of gas for cooking purposes have, of course, brought about quite a different state of affairs. Further, there is the greater tendency than previously to ride instead of walk. (3) The great improvements in the machinery of production and distribution, particularly as regards electricity, and this has probably more than counterbalanced the increased cost of labor and material. Indeed, it is very largely owing to the extension of electricity for commercial purposes that these corporations have made such rapid progress. The supply of cheap power in certain countries such as Scandinavia and America is practically inexhaustible, and this can be transformed into electric energy at remarkably low rates. To illustrate this I will refer to an article in the "Economist" which appeared a short time ago, in which the writer gives the estimated theoretical power of the streams in the United States as 230,000,000 horsepower, and the amount actually in use as only 6,000,000 horsepower. Further, the quantity really available is about 37,000,000 horsepower, enough to "operate every mill, drive every spindle, propel every train and boat, and light every city, town and village in that country."

Public Utility companies enjoy a more secure position than the majority of industrial companies, since they supply the people with what are practically necessities of modern life, viz., water, gas, electric light and power, telephone service, and means of trans-

port, and these are required and must be supplied every day, whether the times be good or bad. In illustration of this point, it is a fact that the volume of business done by this type of company is very nearly the same in periods of great trade activity and flourishing conditions generally as it is in times of severe depression. The stability of earnings naturally makes the bonds and prior charge stocks an attractive form of investment, and particularly so with those of the United States and Canada, where the interest yields obtained are appreciably higher than those of British corporations. Operations are nearly always carried on under franchises granted by the local authorities, the terms of which it is most important to examine. It is desirable that these should be free from irksome restrictions and be either perpetual or run for a long period. It is not necessarily essential that the term of the franchise should exceed that of the bond under consideration (although this is an advantage), as the franchise can usually be extended on a reasonable basis, and there is a law in the United States, I believe, in this connection, which prohibits the confiscation of property. Gas and electric light companies are almost invariably in competition with each other in this country, but abroad the same company frequently supplies both commodities, a factor which makes for stability of earning power. In America, Public Utility companies are frequently placed under special State enactments—California, for example, being subject to the Railroad Commission of that State.

A few figures taken from the "Commercial and Financial Chronicle" may help to show the enormous growth which has taken place in the earnings of electric tramways and street railways in the United States. About 300 of such companies obtained an increase in 1911, as compared with 1910, of $27,000,000, representing over 6 per cent of the total, and this was at a time when the ordinary railroads showed a decrease in earnings of about the same amount. Again, the United States Census Bureau collected statistics covering the period 1902-1907 (excluding gas companies, for which the figures have had to be estimated), and from these it would appear that the total capital thus invested approximated to $10,000,000,000 or about £2,000,000,000 sterling. The relative importance of this is obvious when it is remembered that the figures for steam railroads are estimated at less than $20,000,000,000, or about £4,000,000,000 sterling.

Now, dealing with the figures of the three years, 1910, 1911 and 1912, nearly $700,000,000 of new capital was invested in the bonds of public utility companies, and in addition about $100,000,000 was raised by the means of the issue of stock.

Incidentally, I may mention that a few years ago Poor's Manual, a book very similar to our own Stock Exchange Official Intelligence, included within its scope particulars of public utility companies doing business within the United States. In 1911, however, it was found necessary to issue a separate volume for these and industrial securities, while this year a further expansion took place and a book of over 2,000 pages is now devoted to setting forth the essential facts of public utility companies alone.

There is no doubt that the market for this type of bond is rapidly growing, particularly in this country, where, until a short time ago, comparatively little attention had been given to such a remunerative class of investment. From 5 to 5½ per cent can now be obtained with reasonably good security, but considerable discrimination and judgment in picking out the best bonds is required. In addition to examining the franchises, as already pointed out, the capitalization must be thoroughly investigated, and this should bear a satisfactory relation to the physical value of the property. Enterprises which have not arrived at a mature condition—that is, are still in the construction state—should be left severely alone.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Fire Losses for October.—The fire losses of the United States and Canada for the month of October, as compiled from the records of "The Journal of Commerce," show a total of $14,004,700, a considerable reduction from the 1913 figures. The following table gives a comparison of the losses by months this year with those of the same months in 1913 and 1912, together with the monthly record for the balance of those years:

	1912.	1913.	1914.
January	$35,653,150	$20,193,250	$23,204,700
February	28,601,650	22,084,600	21,744,200
March	16,650,850	17,511,000	25,512,750
April	16,349,400	16,738,250	17,700,800
May	21,013,950	17,225,850	15,507,800
June	16,103,450	24,942,700	29,348,000
July	15,219,100	20,660,900	17,539,800
August	14,158,800	21,180,700	11,765,650
September	13,779,300	17,919,300	14,383,050
October	13,651,650	14,932,750	14,004,700
Total ten months	$191,163,300	$193,389,300	$190,711,450
November	16,172,300	15,207,600	.....
December	17,967,000	16,126,450	.....
Total for year	$225,320,900	$224,723,350	.....

* * *

The Rôle of Congenital Diseases in Infant Mortality.—Under the above title Dr. Jacob Sobel, of the New York City Bureau of Child Hygiene, gives some most interesting facts and conclusions drawn therefrom in a recent number of the Monthly Bulletin of the New York City Department of Health. We quote as follows:

"Sanitarians the world over have come to realize that any further appreciable reduction in infant mortality must come through concerted effort directed against deaths from the congenital diseases, which are increasing annually, and which claim about three-quarters of the thirty-seven per cent of children that die during the first month, and nearly one-third of all children who die during the first year. In this city during the past ten years, the number of deaths under one year of age from diarrhoeal, respiratory and contagious diseases, and all other causes except congenital diseases, has declined. The number of deaths from congenital diseases has increased from 4,740 in 1903 to 5,495 in 1913, while the death rate from these diseases during 1911, 1912 and 1913, has been 39.2, 40.4 and 40.7, respectively, or in other words, practically stationary. In fact, of all the disease groups causing infant deaths, congenital diseases at present occupies the non-enviable first place, superseding diarrhoeal diseases which for many years was the leader. It has been estimated that of all deaths due to congenital diseases in New York City—prematurity, congenital debility, convulsions, malformations, injuries at birth—about thirty per cent die on the first day of life, and about fifty per cent during the first week, while in the registration area of the United States eighty per cent of all deaths due to these diseases occur during the first month of life; furthermore, statistics show that of all children dying during the first month of life in the registration area of the United States, almost two-thirds die during the first week, and about two-fifths on the first day. It is clear that such deaths bear no relation to hygienic or dietetic errors, and that this mortality must be attributed to conditions arising before, at, or directly after birth. This being the case, the need for prenatal instruction, that is for advising and guiding expectant mothers in all matters bearing upon their own health and that of their offspring, is apparent, and there is no doubt at all that this work must eventually be taken up by municipalities, if it

is hoped to effect any further considerable reduction in the infant mortality rate.

"The New York Milk Committee early recognized the importance and possibilities of this problem, and in 1911 took up prenatal guidance as part of its infant mortality work. The work was continued through 1912 and 1913, a special corps of trained nurses and physicians devoting their attention to it. Naturally, the Department of Health afforded every assistance to this committee through its Infants' Milk Stations, the nurses of which enrolled all expectant mothers with whom they came in contact at the stations or in the homes. In this way, and by receiving tentative reports from the committee, the Department of Health was able to keep informed concerning the progress of the new work. It was realized that despite the pronounced reduction in the city's infant mortality rate during the past ten years (152 in 1903 to 101.9 in 1913), this reduction had been largely among babies over one month of age, whereas the death rate of children under one month had varied but slightly.

"This is well shown by the following analysis of infant mortality in the City of New York, 1906-1913 (the figures are rates per 1,000 births):

	Death Rate, Children Over 1 Month, Under 1 Year.	Death Rate, Children Under 1 Month.
Average 1906-1910	95.0	40.8
Year 1911	72.4	39.2
Year 1912	67.1	38.2
Year 1913	64.2	37.7

"Analyzing the cause of death and comparing the five-year period of 1908-1912, inclusive, with the year 1913, we find the infant death rate, in New York City, based upon 1,000 births, as follows:

Diseases.	1908-1912 (Average).	1913.	Decrease Per Cent.
All causes	120.0	101.9	15.0
Congenital	41.3	40.7	1.5
Respiratory	25.8	23.5	8.9
Diarrhoeal	33.4	22.5	32.6

"This demonstrates how all methods heretofore adopted for the control of infant mortality have left uninfluenced the deaths from congenital diseases; it indicates that any future infant mortality reduction must come about mainly through the control of this group of diseases."

* * *

Cotton Fires in the Southern States.—The fatality which appears to make increasing fire losses regularly coincident with business depression, large stocks, slow sales and low prices in any department of commerce, seems to be making itself felt in the way of an uncommonly large number of cotton fires in the South. The October fire loss statistics of the New York "Journal of Commerce" enumerate the following conflagrations:

Sudler, Texas, cotton gin	$10,000
Waco, Texas, cotton warehouse	80,000
Moultrie, Ga., cotton warehouse and contents	200,000
Florence, Ala., cotton warehouse	14,000
Nacogdoches, Texas cotton oil mill	15,000
Austin, Texas, cotton shed and gin	12,000
Beleress, N. C., cotton gin and others	40,000

Upon this experience, the "Journal of Commerce" comments as follows: "The frequency of cotton losses in the South has been commented upon by underwriters, and it would seem that there must be some new hazard that needs investigation. One special agent has advanced the theory that the present process of ginning cotton has probably introduced features which cause sparks to ignite the loose cotton, which, being hastily baled, conceals for the time the smoldering fire. Tightly packed cotton may be on fire for days, it is said, before the flames break out. If this be true, the subject should be investigated by the rating association of the South."

It is, of course, always possible the "new hazards" may arise in connection with any commodity or property which is insured against fire; and the mere suspicion of such "new hazards" warrants careful investigation of the matter. It may, however, safely be predicted that such an investigation in the present case would show that present methods of ginning cotton are far less hazardous, from a fire point of view, than any heretofore known. The rapid introduction of all-steel gins, installed in gin-houses of concrete and all-steel and iron construction, has materially diminished the gin-hazard; and the warehousing of cotton in the South is as a rule much more careful, in respect of exposure to fire, than was the case a few years ago. Hence, if an investigation were had of the unusually high proportion of cotton fires this season, it seems improbable that it would result in the disclosure of a "new hazard" in these directions. On the contrary, it might show that the "new hazard" is simply the old friend (or enemy) of fire underwriters,—i. e. "moral hazard."

INSURANCE NEWS IN THE WEST

The Illinois Insurance Federation.—The Illinois Insurance Federation completed its organization at a meeting held in Chicago on Tuesday evening. The preliminary organization work has been going on for several weeks and the Federation starts with about 1,000 members, of whom over 750 already have paid their dues. Harve J. Badgerow, of Chicago, who volunteered to act as secretary during the organization period and in that capacity contributed much to the good start made, was elected president. The officer on whom the most work will fall will be the secretary, who is to be on salary and exercise managerial authority. He is to be chosen by the executive committee and appointed by the president. Upon him will devolve the work of organizing the insurance men in each of the fifty-one senatorial districts of Illinois and appointing a chairman for each district. It is the intention of the officers to organize the State on lines similar to those of the political parties, so that the entire insurance strength of the State can be called upon when necessary. As many insured as possible will be secured as members also.

At the meeting on Tuesday one of the members stated that it had been reported to him that there is already drafted at Springfield a bill intended to put Illinois on the State fund monopoly plan as regards insurance of workmen's compensation. Superintendent Potts has been talking of the effort he will make to have a law enacted providing for compulsory State fire insurance. Hence the feeling prevails that the insurance people would better be looking closely after their interests.

* * *

Proposed Extension of Chicago Fire Limits.—The proposed ordinance to extend the fire limits of Chicago was under consideration by a subcommittee of a city council committee again this week. This question has been up for months. The ordinance has strong forces behind it, including architects, underwriters and others. The lumber interests have been strong enough, however, to prevent action up to this time. Underwriters have recognized for years that Chicago is subject to an immense conflagration hazard in the residence district. This is the chief excuse of any value for the continued holding up of dwelling rates in the city and county

to a point so much above the rates prevailing in other parts of the State.

* * *

The Organization of the Universal Fire of Chicago.—Cook County field men are reported as wrought up over the organization of the Universal Fire of Chicago. This is really quite unnecessary, as the danger they scent is afar off; but it gives them something to worry about. Gerald A. Rolfes is organizing the company. The plan is to have a million of capital and an equal amount of surplus. That is considerable money to raise in times like these. Mr. Rolfes is said to have had some experience as a promoter and he is very well spoken of. Associated with him in the venture are about half a dozen class 2 Chicago agents. He insists that the company will be strictly orthodox and will join either the Western Union or the Western Insurance Bureau when it is ready for business; but some of the field men in the county have the idea that it is being organized as a protest against the expense reduction programme of the established companies, as a result of which class 2 agents have suffered some shrinkage of income. To those who figure on the length of time likely to elapse before such a pretentious proposition is actually put over, this fear of trouble is amusing.

It is announced that the cost of promotion is to be held down to 20 per cent. In other words, after the stockholders had paid in the $2,000,000 proposed, the company would have $1,600,000 of assets. What some people cannot figure out is, why anybody should want to pay $200 for this stock when he can buy stock of established companies, with a plant, business, reputation and fully as large a surplus in proportion to capital for less than $200. Those who cannot figure this out are the ones that cannot see why the Cook County field men should be worrying.

* * *

Kansas Fire Rates to Be Restored.—The old rates that were effective in Kansas before the reductions ordered by Superintendent Barnes at the time the rating law became effective will be restored on December 1. The Supreme Court ordered their restoration by a decree entered last week, but the companies agreed with Superintendent Lewis that it would require about three weeks to get out necessary instructions and make preparations.

* * *

Postponement of Potts Anti-Trust Suit.—The suits started by Superintendent Potts, of Illinois, against the fire insurance companies, both those to stop the operation of annexes and those under the anti-trust law, have gone over by agreement until December. It is understood that any court action on the companies' Federal injunction suit to prevent interference by Judge Potts with the business of companies operating annexes, will also go over till next month, although depositions will be taken in the latter case in Chicago next week.

* * *

New Illinois Insurance Superintendent Possible.—Considerable doubt is felt in some quarters in Chicago whether Rufus M. Potts will continue as Superintendent of Insurance of Illinois much after the first of the year. He was appointed to the office after the last Legislature adjourned and has therefore never been confirmed. The Senate in the recently elected Legislatiure is almost evenly divided politically. It is believed to be by no means certain that it will confirm his nomination. It will be remembered that there was a warm contest for the position when Mr. Potts was appointed, but nothing that his competitors or enemies could do seemed to move Governor Dunne in the least. This gave rise to the belief that his appointment had been agreed to before others entered the field and that the Governor could not go back on the agreement. While Mr. Potts has had the approval of many local agents in the State for his fight on fire insurance annexes, he has incurred the ill will of many of them by his anti-trust suits. Neither is his attitude on licensing inter-insurance exchanges pleasing to representatives of the stock casualty companies. Of course, the fire insurance companies do not like his attitude towards them generally. Hence, with an almost evenly divided Senate and two factions in the Democratic side, there is ground for doubt whether enough opposition to him will not develop to prevent his confirmation.

* * *

Election Results in the West.—The new administration in Oklahoma will go into office under a platform pledge to enact a workmen's compensation law. The Democratic platform does not specify the nature of the law to be passed, but the State Labor Commissioner-elect, it is stated, will work for a State fund bill along lines desired by the State Federation of Labor.

In Kansas it is possible that there will be no State fund legislation. The Labor Commissioner was one of the active advocates of this plan and he will go out of office, the Governor who appointed him having been defeated for re-election.

Chicago, November 13, 1914. LA SALLE.

ITEMS OF INSURANCE NEWS.

Two important decisions as to the extra-territorial effect of State workmen's compensation acts were handed down during the week. The first was delivered by Justice Swayze in the New Jersey Supreme Court on November 9, in the suit of the widow and posthumous child of John A. Rogge, Jr., against the American Radiator Company. Rogge was killed while acting as a traveling salesman for the company. The company claimed that the contract of service was made in New York, and that therefore the New Jersey act did not apply. Justice Swayze held that, if the contention were good, New Jersey would be deprived of its right to regulate its own industries. The company was ordered to pay the widow $10 a week for 300 weeks.

The second decision was rendered by the Connecticut compensation commission in the case of F. P. Welton, a director and treasurer of the Waterbury Rolling Mill Company, who was injured while on a visit to Canada in the service of the company. The Globe Indemnity Company put in an objection on the ground that the accident, occurring in Canada, did not come under the compensation law. Welton, however, was awarded $10 a week for eight and a half weeks with his doctors' expenses.

A financial report has been issued covering the operations of the California State Insurance Fund for the nine months January 1 to September 30, 1914. The report shows moneys received, (including a State appropriation of $100,000, premiums written and interest) amounting to $567,017. The fund paid out and has outstanding liabilities and unearned premiums amounting to $342,936. There were 2,478 accident cases handled, and medical payments amounted to $52,523. Estimated cost of outstanding compensation and statutory medical payments is put at $110,456, in which the statutory reserve of 72 per cent of earned premiums less losses and loss expenses paid for outstanding payments is not included. This item would bring the amount up to $167,456. The total surplus, made up of the State appropriation of $100,000 and the accumulated surplus, is $224,020.

In a letter accompanying the report, Mr. C. W. Fellows, manager of the Fund, writes that "On January 1, 1915, barring any unusually serious and unexpected calamity, we will be prepared to allow to policyholders a return premium of from 5 to 25 per cent of premiums earned, the amount of return depending on experience in the various hazard groups. The total return will equal, however, 15 per cent of the total premiums earned. This return will not affect minimum premiums.

"We are able thus to advise employers because of our low operating cost, the California insurance laws requiring the setting aside of claim reserves equaling 72 per cent of all earned premiums, less losses and less expenses paid. This reserve must be maintained for five years and, as our experience does not show the possibility of losses and loss expenses equaling that percentage, we can then taken down the difference between the reserve and the actual value of claims. This may then indicate a further return premium to 1914 policyholders after a fair catastrophe surplus is set aside. * * * Aside from the surplus accumulation and the policy provision regarding return of premium, our Inspection Department has made careful inspection of plants insured. To many of these plants the merit classification is now being applied, the merit inspection thus far made resulting in rate reductions of from 1 to 40 per cent, or a net average reduction of 10.08 per cent."

During the three-year period ending September 30, there were 43,321

industrial accidents reported to the Industrial Insurance Commission of the State of Washington, according to the "Insurance Post," of Chicago. This is an average of 1,200 per month for the three years. The accidents reported the first year were 11,896; the second year showed a very marked increase, 16,336 industrial accidents being reported; while the third year there was a decrease of over 1,000, the accidents totaling 15,089. This decrease is attributed by the Industrial Insurance Commission to the safety campaign being conducted among the State's industrial plants, but decreased industrial activity probably was an important factor in the reduction. The decrease in the number of accidents is particularly noticeable during the nine months of the present calendar year, when only 11,196 accidents were reported as compared with 12,723 for the corresponding nine months of 1913, a decrease of 12 per cent. Each month of this year has shown less accidents than the corresponding month of 1913. Since the first of this year the industrial insurance department, in co-operation with the State Labor Department, has been actively engaged in a "safety first" campaign in an effort to reduce the increasing accident rate shown by the second year under the law. Shop safety committees of employes have been organized and are working actively toward accident prevention in most of the large industrial plants of the State.

At its recent annual convention, the Michigan Federation of Labor adopted resolutions calling for a number of changes in the workmen's compensation law of that State. The changes advocated were that victims of occupational diseases be allowed compensation the same as victims of industrial accidents; that payments to injured employes commence eight days after disablement instead of fifteen days afterwards, as at present; that insurance adjusters before they be permitted to work in that State pass an examination before the industrial commission; that general contractors be made responsible in case the employe of a sub-contractor is injured, and that the Attorney General's department be required to represent injured employes, in the event that their cases may be appealed from the industrial accident commission to the Supreme Court.

Complete returns are not available even yet showing the results of the election on November 3. Partial results were given in these columns last week, and it is now possible to say with some assurance that the State insurance workmen's compensation act in Montana has been defeated. Returns received up to Thursday of this week indicated that the referendum on the workmen's compensation law in Nebraska was going in favor of the law. Seventy-six counties out of nlnety have been heard from giving the compensation law a majority of 1,500. It is believed that when the votes in the remaining fourteen counties are counted the majority will be increased. Thirty-eight counties out of ninety gave 41,604 votes for the law and 41,607 against it.

It is reported that the work of the New York State Fire Marshal's office for the remainder of the year has been stopped because of the wording of the bill appropriating money to maintain the bureau. The bill provided that after October 1 any unexpended balance of the appropriation must be used only to pay salaries of the officers.

Attorney General Parsons held that the Fire Marshal must abide by the wording of the statute and all of the inspectors of the bureau have stopped work. There remains $50,000 of the original appropriation and only about $9,000 will be required for salaries until January 1.

The wording of the appropriation bill was the result of an agreement between the Assembly and Senate at the extra session of the Legislature, when the Republicans wished to abolish the office. Now it appears that Governor-elect Whitman is determined to abolish the office entirely as soon as he takes his place in Albany, believing that the position is entirely useless and is merely a charge upon the State.

Press notices and dispatches as collated by the Bonding Department of The Fidelity and Casualty Company of New York, indicate, for the month of September, 1914, the following defalcations:

Banks and trust companies	$241,333.62
Beneficial associations	31,970.18
Public service	14,717,51
General business	208,272.64
Insurance companies	65,465.00
Transportation companies	3,834.87
Miscellaneous	31,525.43
Total	$597,119.25

The Texas Commissioner of Insurance and Banking has issued a ruling under which insurance companies doing business in Texas are allowed to carry five bales of cotton as admitted assets. A number of companies have purchased cotton in furtherance of the much discussed "buy-a-bale" movement. It will be remembered that the New York Insurance Department issued a contrary ruling some time ago.

A. R. MARSH, Editor
GUY EMERSON, Associate Editor
W. B. MARSH, Business Manager

ON Monday of this week actual operation of the Federal Reserve Banks of the United States was inaugurated. The member banks at once began paying into the Reserve Banks of the twelve districts the approximately $243,000,000 of reserves which they are estimated to be required by the Federal Reserve Act to carry with the latter, and some part of the $84,000,000 which may be carried either in the member banks' own vaults or with the Reserve Banks. The member banks had already, on November 2, paid in to the Reserve Banks one per cent of their capital and surplus, as the first contribution called for by the Federal Reserve Board towards their subscriptions to the capital stock of the Reserve Banks, and 2 per cent more is required to be paid in immediately, making a total of three per cent of capital and surplus as the compulsory contribution of the member banks towards the capital proper of the Reserve Banks. On the basis of the March 4, 1914, consolidated statement of the National banks of the United States (and these alone are as yet member banks), this three per cent of capital and surplus would amount to not far from $53,500,000. An additional three per cent may be required by the Federal Reserve Board to be contributed for this purpose, should the needs of the business or some exigency make this additional capital desirable for the Reserve Banks. As the matter stands to-day, however, the amounts compulsorily paid into the Reserve Banks by the member banks will be approximately as follows: (1) Contributions of member banks to capitalization of Reserve Banks, $53,500,000; (2) reserves required to be carried with the Reserve Banks, $243,000,000,—or a total of not far from $300,000,000. Reserves optionally carried with the Reserve Banks may be from $20,000,000 to $30,000,000 more. In other words, the twelve Reserve Banks are beginning their career with resources in hand of nearly $325,000,000, to which may quickly be added some $53,500,000 more (additional contributions to capitalization), in case the Federal Reserve Board should so determine. Naturally, all growth in the aggregate capital and surplus of the National banks of the country will immediately be reflected in larger resources of the Reserve Banks; and, more important still, the admission of State banks and trust companies to the Federal Reserve System, should a general movement of this kind develop, would add rapidly and largely to those resources. There is, moreover, still another way in which the funds of the Reserve Banks may be considerably increased, i. e. through deposits of member banks, over and above the reserves required of them, maintained with the Reserve Banks for the facilitation of the free collection of checks and other credit items drawn either upon Reserve Banks or upon other member banks, as provided by the Federal Reserve Act. It is as yet altogether a matter of speculation both how rapidly this system of domestic exchanges will be developed and how large the aggregate of deposits of member banks with Reserve Banks, to take care of it, will prove to be.

Under the new law, it is a function of the Federal Reserve Board to "review and determine,"—i. e., to establish,—from time to time the rates of discount (or rediscount) to be charged by the Reserve Banks of the several Reserve Districts. On Saturday last the Federal Reserve Board announced its first set of rates of rediscount, for use in the twelve Districts until further notice. These rates were as follows:

	Paper Maturing within 30 days. Per cent.	beyond 30 days. Per cent.	All Maturities. Per cent.
New York and Philadelphia...	5½	6	..
Boston, Cleveland, Richmond, Chicago and St. Louis.....	...	..	6
Atlanta, Minneapolis, Kansas City, Dallas and San Francisco	6	6½	..

At this writing there has appeared no publication of the rediscount rates actually adopted by the directors of each of the Reserve Banks, although it was speedily reported from Dallas that officials of the Reserve Bank there intended to make the rate for all maturities not higher than 6 per cent and perhaps as low as 5 per cent. Whether this intention has been carried out is not yet known through any published statement; and similar action on the part of other Reserve Banks, if such has been taken, is likewise unknown. Perhaps a suggestion of cross-purposes between the Federal Reserve Board and the Dallas Reserve Bank at least, made itself apparent in the reported determination of the latter thus to adopt a rate materially lower than that established for the Dallas District by the Board. According to the press despatches, the Dallas officials regard the rate established by the Federal Reserve Board merely as a *maximum* rate, with the discretion left to them to adopt such lower rate as the local conditions may in their opinion justify. This view, however, is scarcely in accord with the policy disclosed by the statement of Governor Hamlin, of the Federal Reserve Board, made simultaneously with the announcement of the rates for the several districts, that "it was felt [by the Board] that the adoption of rates of rediscount which would adequately safeguard the resources of the various institutions will be the wisest policy at the beginning, particularly in view of the considerations already set

forth in the Board's Circular No. 13." In other words, it is apparently the purpose of the Board to keep for itself the decisive voice as to the rediscount rate which each of the Reserve Banks shall charge, and through this means to regulate the flow of capital and credit from one section of the country to another. The Dallas officials, on the other hand, would seem to be bent upon making their rediscount rate, within a maximum prescribed by the Federal Reserve Board, fit what they conceive to be the financial and commercial interests of their district, without much regard to the effect of their rate upon the ebb and flow of money between their district and other districts. Obviously, this is a matter of vital importance to the whole future of the Federal Reserve system, as that has been worked out in the statute. We have no means of knowing whether the present indicated disagreement between the Federal Reserve Board and the Dallas Reserve Bank has been accommodated without real friction; but it is certain that the same difficulty is going to present itself again and again, and that it is more than likely to give rise to feeling from time to time on the part of the Reserve Bank officials and the commercial community of this or that reserve district. It is, of course, clear that the way of drawing money from districts where it is abundant and easy to those where it is relatively scarce and in active demand is to make the rediscount rate in the former low and in the latter high. But the obverse of this is that borrowers look only to the rate which they are themselves called upon to pay and have slight interest in considerations reaching beyond themselves. Hence it may be assumed that borrowers in districts for which the Federal Reserve Board fixes relatively high rediscount rates will look enviously and rebelliously from their own to those other districts where borrowers are getting money at the relatively lower rates. Their feeling will be reflected by the local Reserve Bank officials; and it will be no small problem to prevent intersectional jealousy from running riot. It is not meant by this to imply that the problem is an insoluble one, provided always that the Federal Reserve Board is allowed to deal with it judiciously, yet firmly. If, however, the Secretary of the Treasury, a political officer, undertakes to participate actively in the management of the Board, it may be taken as a foregone conclusion that serious complications will develop at this point.

Although the Reserve Banks have been in operation less than a full week, it has become apparent that still another perplexity is making itself felt. The Banks now have at their command the great sum of over $300,000,000 mentioned above, and naturally their officials are desirous of undertaking some of the actual business for which the Banks are intended. But reports from Washington on Thursday indicated very considerable disappointment at the small amount of paper which is being offered by member banks to the Reserve Banks for rediscount. The conclusion of the Federal Reserve Board is reported to be that the discount rates fixed preliminarily for the different districts are too high and must be reduced. The truth is that such rediscounts as have as yet been sought, have all the appearance of being purely complimentary in character and not indicative of a normal business use of the rediscount facilities by member banks. No actual figures of the amount of paper turned in for rediscount have been published,—indeed, it is too early to expect such figures. But everything points not only to an entire absence of pressing demand for rediscounts, but even to an almost complete absence of any real demand at all. Naturally, this is disquieting, even if unnecessarily so, to the officials of the Reserve Banks and to the Federal Reserve Board. They would like to be able to announce quickly that they are in the full flow of business, unquestionably filling an imperative need hitherto incapable of being met.

The hard fact, we suspect, has now to be faced that the period of enthusiasm is past and that the Reserve Banks must go about getting business exactly as other banks do, i. e. by "buying it," as the phrase is. We mean by this that they must induce the member banks to come to them in substantially the same manner as the member banks induce persons to become their customers. This would not be true, of course, if we were in panic times, with a fierce demand for short-time money and with the member banks so pressed to give accommodation and so uneasy about their own situation that they would turn eagerly in any direction in which relief was promised. Under such circumstances there would be no problem in the getting of paper for rediscount at almost any rate. At the present moment, however, there is no pressure anywhere in the country for money for short-time use; on the contrary, there is really a plethora of such money. Capital for fixed investment is hard to get, to be sure; but the volume of ordinary trade is relatively small, the prices of commodities have declined severely, pay-roll requirements are unhappily much below normal and consequently the banks generally are amply supplied with resources of their own for taking care of the ordinary business turnover. If they rediscount their prime short-time commercial paper they are simply giving away profits which they have in hand and which they need without diminution for the repair of the inevitable losses of the period of trouble through which we have been passing.

It is hard to see, then, how there can be a speedy flow of commercial paper in quantity for rediscount with the Reserve Banks. Many persons have had a vague notion that an immediately consequence of the opening of these banks would be the retirement of the outstanding Aldrich-Vreeland emergency currency and the rediscounting of the collateral against such currency with the Reserve Banks. The latest report of the Comptroller of the Currency upon the amount of the emergency currency in circulation, issued on November 14, showed that all told $377,912,190 had been taken out, of which $58,228,540 had been retired, leaving outstanding on the date of the report the amount of $319,683,650. If all this could be rapidly transferred to the Reserve Banks by means of rediscounts of the collateral, those banks would have almost from the start a very respectable volume of business on their books. But, unhappily, it is known that only an exceedingly small part of the collateral which has been accepted by the Treasury Department under the Aldrich-Vreeland Act is of a character to be rediscounted, under the Federal Reserve Act and under the regulations governing discountable paper which have recently been published by the Federal Reserve Board. The retirement of the Aldrich-Vreeland currency is going to be a very slow and laborious process, in which the Reserve Banks can help but little. Indeed, if real use is made of the so-called Cotton Pool Fund of $125,000,000, whose completion has been announced this week by Secretary McAdoo, we shall speedily have more, and not less, emergency currency in circulation and must look forward to a longer, rather than shorter,

period before we can get rid of this ready remedy for panics (and credit strains generally), and can look to the normal operation of the Federal Reserve System for the efficient regulation of our credit and currency.

Finally, it must be stated that the rigidity of the definitions of rediscountable paper promulgated by the Federal Reserve Board are likely to restrict very greatly the amount of that paper which member banks could offer for rediscount, even if it were for their profit so to do. By these definitions a truly enormous part of the business of the country is removed entirely from the field of rediscount. By way of illustration, what a vast amount even of short-time paper is rendered undiscountable by the provision that the note of a buyer of a tool or implement for his own use is not commercial paper, within the provisions of the law. A dealer in plows or mowing machines can, of course, give notes to the manufacturer which may be rediscounted; but if a farmer who buys a plow or mowing machine gives his three-months' note for it, the note cannot get beyond the original bank which discounts it for the dealer. As the definition runs: "'Agricultural, industrial or commercial purposes' cannot, therefore, be held to include investments in land, plant, machinery, permanent improvements, or transactions of a similar nature." Even in the commerce in commodities the restrictions of the definitions must severely reduce the amount of rediscountable paper. Thus: "The purchase of commodities for purposes which are merely speculative and not connected with an intimate process of manufacturing or distribution would constitute a 'mere' investment, and bills covering such investments are accordingly not eligible for rediscount." So a cotton merchant who believes that cotton is now cheap and will six months from now be higher and who would like to buy a stock of cotton to be held in warehouses until the higher price is realized cannot give notes, however ample his financial responsibility, which the lending bank or banks, however great the emergency or however near maturity the notes might be, could rediscount with a Reserve Bank. It is impossible to estimate how far-reaching this restriction will prove to be; but it is certain that a vast volume of commercial transactions will be affected by it. And with these heavy handicaps the Reserve Banks must somehow get business enough to justify their existence, in normal or even in dull times. Like other banks, they must "buy" this business,—i. e. make it profitable for the member banks that are their customers to enter into it. The problem is a large and complicated one. Mere adjustments of the rates of rediscount will not solve it.

Arthur Richmond Marsh

HARMONIZING PUBLIC AND PRIVATE INTEREST IN THE SOLUTION OF OUR PUBLIC UTILITY AND CONSERVATION PROBLEMS.

By Andrew J. Frame*
President, the Waukesha National Bank, Waukesha, Wis.

BEFORE discussing the subject of my paper, permit me to say that I refrain from criticism or comment as to the causes of the present depression in security values, but shall confine myself to constructive suggestions, with the hope of helping to substitute stability and confidence where instability and distrustful pessimism seem now to prevail. Further, for fear my motives may be misconstrued, I will say that I am not a promoter and have no interest in watered stocks or bonds of any nature. My whole purpose is to broaden and stabilize progress.

The American people are now wrestling with the great question of how to deal justly with and equitably settle the vexed and complex public utilities problem; and how at the same time to conserve our natural resources in the interest, not of the classes, but of the masses as a whole.

True progress is brought about, not through special privilege, nor through unbridled radicalism, nor under a socialistic régime. On the other hand, I am fully convinced that all history proves the truth of the declaration of that great statesman, Thomas Jefferson, to-wit: "Agriculture, manufactures, commerce and navigation,—the four pillars of our prosperity,—are most thriving when left most free to individual enterprise."

Individual initiative; the ownership of one's own home, "sweet home"; the right to enjoy the fruits of one's own labors,—these lift even the lowest man to the right of kinship, energise his activities, and thus insure the greatest possible progress to any nation. The result of individual freedom in the United States is the most shining example of progress the world ever knew.

State Socialism, born, in most cases, of philanthropic intent, is destructive to human progress, because the knowledge that the State will care for us blights the energies of the few who are born with broad powers of initiative. The masses grow indifferent if the State will care for them. To abolish poverty is, alas, beyond the power of man. For proof, read that Book of Books, the Bible, "The poor ye have always with you"; read the parable of the ten talents; read the three thousand proverbs of Solomon. Refutation seems impossible.

The temporary pyrotechnic displays of progress through inordinate expenditures under Socialistic theories, blind many who do not study history broadly. These flights of economic debauchery result generally in inordinate taxation and staggering public debts, as well as blighted human energy.

The best authorities agree that the differences between private and public ownership and management of any utility or enterprise approximates 20 per cent in favor of individualism. This 20 per cent alone spells human progress, as against public decay. Government ownership is a pure monopoly and destroys individual initiative and opportunity, and thus hampers progress. Public property under constant political changes of control is in a large measure considered public plunder, but under individual ownership, the watchful eyes of the owner compel better management and greater progress. I, therefore, firmly believe that our greatest progress lies in individual ownership and management of public utilities, railroads, etc., but subject to governmental supervision. Let us never forget, on the other hand, that such supervision must permit of reasonable profits, because profit enlarges and loss blights all progress. And labor, quite as much as capital, is interested in the maintenance of progress. Doubtless on such a middle ground lie our greatest progress and our purest advantage. The great bulk of the masses desire justice; therefore, let us reason together a little.

It may appear to be a broad claim, but I profoundly believe, after mature deliberation—coupled not with theory alone, but with actual experimental proof—that the solution I am about to suggest deals equitably with capital and the people alike. All honest men and all true reformers crave such a result.

A few years before Chicago granted the present Electric Railway Ordinance, I gave an address at a bankers' club meeting in Chicago, outlining those ordinances practically as they were later granted. I have reason to believe that the publication of that ad-

*An address delivered before the convention of the Investment Bankers' Association of America, at Philadelphia, Pa., November 13, 1914.

dress had something to do with shaping those ordinances. The result has proved eminently fair, both to the many owners of the securities of the Chicago street railways, as well as to the people of Chicago, in a just division of the profits.

Permit a brief outline of a plan based upon this Chicago railways plan, as a suggested solution of the general question, for adoption generally throughout the United States. I offer it in the hope and firm conviction that, if adopted, it will solve the knotty problems equitably. It will also substitute optimism in place of halting pessimism and general satisfaction will reign. The following covers, in practical outline, what I have in mind:

Public Utilities.

First. They should be under the control of the United States Corporation Bureau or the Interstate Commerce Commission for interstate enterprises; and under State Commissioners for State enterprises.

Second. In any public utility corporation hereafter organized, the issues of stocks and bonds allowed by the commissioners having jurisdiction should be limited to the actual values of all moneys or properties at fair values turned into the corporation; also cost of incorporation and interest on money or property advanced up to the day of opening the corporation's business. To this should be added a percentage of stock to cover reasonable risk. This might be graded down to not over 10 per cent in the case of corporations promising quick returns. In no case should the amount allowed by the Commissioners have the taint of "watered stocks." Bonds should be limited to not over 75 per cent of total costs. All securities in excess of this 75 per cent should be stock issues, which would cover good faith of promoters and owners.

Third. Non-competitive charters should be granted for not less than twenty years, with rates of service likely to pay to investors an annual net profit of 6 to 8 per cent according to the risk involved. The low limit of 6 per cent set by the United States Supreme Court in the New York City Gas Case, is not a fair criterion, because this is clearly a first class risk. That rate, to cover increased risks in more hazardous undertakings, in cities of the second, third and fourth class, must be increased to tempt capital.

In arriving at the profits, deduct:

(a) For salaries and labor bills.

(b) In order that the innocent holders' investments in stocks and bonds be not jeopardized, compel the corporation, by adequate depreciation charges to maintain the up-keep of the property to its normal condition out of earnings; and also make reasonable reservations to cover accidents and extraordinary risks to which the enterprise may be subject. In short, create a surplus.

(c) Pay the interest on the bonds and other indebtedness; also pay dividends of 6 to 8 per cent on the outstanding stocks, as may be agreed upon when charters are granted, keeping always in mind that the rate of dividend paid should cover the variable risks involved. Doubtless, in some ventures even 8 per cent may be too low to tempt capital.

To encourage capital to develop promptly our public utilities and natural resources for the benefit of present, as well as future generations, make such dividends cumulative, as many new enterprises do not pay in their incipiency.

(d) After all the above are provided for, should any net profits remain, divide them equally between the city, State or Nation entitled to the same and the corporation stockholders.

Fourth. For any permanent improvements or enlargements of present utilities or those hereafter incorporated, additional stocks or bonds should be allowed to be issued only on the approval of the Commissioners, as indicated under the second head.

Fifth. In our search for justice, to the end that present innocent holders of stocks in existing corporations—whose stocks may not be fully paid up—be not wronged by legal enactment, allow present outstanding stocks to remain, the same to be equitably adjusted by the Commissioners whenever the corporation asks for an increase of stock, all of which, it granted, must comply with the new corporation rules. Under this process in a few years practically all wrongs would be righted without doing violence to innocent investors.

Sixth. Extensions of charters should be granted every twenty years, and rates readjusted for service, basing the new rates upon the average annual profits for the past twenty-year period. Wherever profits are large, this readjustment will reduce rates in the interest of the people as a whole and still maintain justice to all.

The average for the twenty-year period is equitable, because every intelligent economist knows the maxim that waves of prosperity follow those of adversity; therefore, net profits and consequently stock values are always fluctuating. Stability of profits and stock values are practically an unknown quantity. To illustrate: The Chicago "Tribune," in 1904, gave a compilation of 120 railroad and industrial stocks, showing fluctuations as follows:

November 1, 1902, market values totaled 8,000 millions of dollars;
November 1, 1903, market values totaled 6,000 millions of dollars;
November 1, 1904, market values totaled 7,500 millions of dollars;

showing a loss of 2,000 millions of dollars between 1902 and 1903, the year of our depression, with its reduced profits. On the other hand, from 1903 to 1904 these same stocks increased in value 1,500 millions of dollars, because of a return of confidence and prosperity, bringing increased profits.

Again, from January 1, 1907, to January 1, 1908, a total of 141 stocks showed a loss of 3,240 millions of dollars, or about one-third their aggregate par value. This was practically recovered in 1908-1909 from the same causes as in 1903-1904.

But in 1910, the year when Nature was most generous in her gifts to the farmer and stocks ought to have risen, 100 of the great corporate stocks showed a loss of 950 millions of dollars, and general business was in a halting mood, doubtless caused by distrust.

Since 1910 Nature has been wondrously kind in her gifts to us, yet savings and other banks, trust and insurance companies—also millions of private investors in legitimate securities—have suffered losses in the vast declines of stock and bond values, far in excess of those of panic periods. These facts have staggered the confidence of investors generally to the extent that capital hesitates, and therefore the wheels of commerce have slowed down.

These facts, together with the daily newspaper quotations, indicating not one stock in a hundred quoted at par, show conclusively to any intelligent mind that to keep stock, or even bond values at par, whether fully paid or not, is purely mythical. The great natural laws of supply and demand; also the rise and fall of confidence, which breeds depression or prosperity; together with the genius of successful business management, or lack of it, causing increased or decreased profits,—these are what practically govern the rise and fall in values, not of stocks and bonds alone, but of all property. Attempts to regulate prices by law exploded as a ridiculous theory even in Diocletian's reign. This Emperor, about 301 A. D., issued an edict stipulating that prices on some 800 articles of necessity, including prices of labor, must not exceed certain limits. Infractions of the law made the participants subject to the death penalty. The law was soon repealed, because the application of it proved that the laws of supply and demand were stronger than statutory enactments.

As the high cost of living is a "live issue" these days, and is

continually brought into the discussion of this very subject, permit me a moment's digression to illuminate this subject by quoting a few extracts from "The Common People of Ancient Rome," by Professor Frank Frost Abbott, of Princeton University.

Here is a table, compiled by Professor Abbott, of Diocletian's maximum prices, 301 A. D., as compared to ours in 1906:

Articles of Food.

	301 A. D.	1906.
Wheat, per bushel	33.6 cents	$1.19
Rye, per bushel	45.0 cents	.79
Barley, per bushel	74.5 cents	.55
Fresh pork, per pound	7.3 cents	14-16 cents
Beef, per pound	4.9 cents	9-18 cents
Mutton, per pound	4.9 cents	13-16 cents
Ham, per pound	12 cents	16-25 cents
Fresh fish, per pound	7.3 cents	12-15 cents
Butter, per pound	6.9 cents	26-32 cents
Cheese, per pound	7.3 cents	17-20 cents
Eggs, per dozen	5.1 cents	25-30 cents
Milk (sheep's) per quart	6 cents	(Cow's) 6-8 cents

Wages Per Day.

	301 A. D.	1906.
Unskilled workmen	15 cents	$1.20 to $2.25
Mason and bricklayer	29 cents	3.70 to 6.50
Carpenter	29 cents	2.50 to 4.00
Painter	43 cents	2.75 to 4.00

Professor Abbott says: "For the urban workman, then, in the fourth century, conditions of life must have been almost intolerable, etc." From this we may fairly exclaim that we thank God we live under the Stars and Stripes in this twentieth century of history. And if we are not workmen, but engaged in the professions, we have all the more reason for such thankfulness. For here are the wages of professional men in Diocletian's time:

Professional Wages.

Elementary teacher, per pupil, per month	21.6 cents
Teacher in arithmetic, per pupil, per month	32.6 cents
Teacher in writing, per pupil, per month	21.6 cents
Teacher in Greek, Latin, Geometry, do	37 cents
Lawyer, for presenting a case	$1.09
Lawyer, for finishing a case	4.35

Probably the teachers and professors of to-day might rebel at Diocletian's edict, but the people would shout for joy over the lawyer's fat fees. Jarndyce vs. Jarndyce would not long survive under such limitations. I will not quote further, however, except to say that freight transportation in 301 A. D., by wagon or camel, approximated in cost fifteen times our average railway rates of to-day.

A comparison of our wonderful general prosperity with the conditions of the early centuries, would seem to indicate that our wails of woe are rather far-fetched. In this enlightened age, we must also heed the warnings of that old Kaffir proverb, that: "He who will not profit by the experiences of the past, gets knowledge when trouble overtakes him." Let us not be carried away by the sophistical preachments of many well intentioned but superficial argufiers. "Truth crushed to earth will rise again." The wrongdoer can be punished, but prices, either of products or of securities, cannot be kept from fluctuations.

But it is time to return to the subject under discussion. The City of Chicago, under such a plan as that described for handling its street railways,—i. e. division of net profits in excess of fixed charges on stipulated total valuations of its street railways, has received over ten millions of dollars in the past seven years as its share of profits on a straight five-cent fare.

This, of course, is not a criterion of what to expect from all public utilities, because large profits come only in great cities of the first class, moderate profits in cities of the second class, and very small profits or net losses from operations in small cities of the third and the fourth class. Excessive corporation profits —except in rare cases of superior management—are a popular fallacy. As conclusive evidence of this fact, the report of the Commissioner of Internal Revenue, for the year ending June 30, 1913, shows that the net profits of 305,336 corporations in the United States were but 3.9 per cent on the par value of their securities. After paying interest on the bonded debts, the stock dividends approximated but 3 per cent. We must not forget that thousands of corporations paid no dividends whatever. In cases where no dividends were declared, evidently labor received its reward and capital none. The Statistical Abstract of the United States indicates the average dividends paid to stockholders of all railroads in the past twenty-five years to have been only 2½ per cent. Over 60 per cent of the total mileage went into receivers' hands and was sold under foreclosure of mortgage. It would seem—if wrongs have been done, right them, but do not punish the millions of innocent stockholders. Those cases are cited to show the equity of the plan of dividing with the municipality or State, after capital development receives its just reward as an encouragement to progress. Capital halts under distrust. Confidence of reasonable protection ensures progress. We are in a halting mood. Clarify the situation and progress is assured. Progress gives full employment to labor and abolishes the public soup house.

Sound Conservation of Natural Resources.

Seventh. Apply the solution just outlined, not alone to public utilities, but with equal force to undeveloped water powers, coal mines, etc., belonging to the State or Nation. In cases of public utilities, non-competitive, time charters seem necessary; but in the case of conservation of natural resources, with the necessity for improvements of a permanent charter, only absolute ownership with a share of net profits to the State and corporations, as indicated, will command and ensure quick development.

Leasing of them prevents borrowing to develop and certainly would materially retard progress. Leasing would be like landlordism in Great Britain. Ownership upbuilds. Leasing retards development.

To illustrate our wonderful possibilities, the developed water powers of the United States are now estimated at 7,500,000 horsepower. The steam, gas and others, say, at 6,500,000 more. The possibility of further water power development is estimated by the great expert engineers at 50,000,000 to 150,000,000 horsepower. Unharnessed water power is annually running to waste and all other powers are consuming forever our natural coal supplies by at least 100 millions of tons annually, as well as other fuel resources.

Eminent authorities claim that, if we should develop from our water powers now running to waste, even ten millions of horsepower above present development, the saving of coal would approximate 25 per cent of our total annual output. The value of this saving can fairly be estimated at 25 per cent of our National Debt of one thousand millions of dollars. Would not such immense coal saving be true conservation? Is it worth while to save $250,000,000, annually now going to waste?

Under such an increased development, the people would save annually vast sums in reduced cost to them of water power as compared to steam power, and the promoters would receive but a fair return upon their invested capital. If profits exceeded the stipu-

lated limitations, those who have risked their capital would receive but half of the excess, and the city, State or Nation the other half. If profits seemed excessive in particular cases, the horsepower rates could be reduced in the interest of the people as a whole.

Further, the tax income to each locality would be materially increased because of the building of the plants, including the vast developments which naturally follow in the wake of such cheapened power. We must not forget, however, that all water powers do not make millions for their owners. We can name several large developments that are in the bankruptcy court, by reason of great floods and other unfortunate conditions. Risk can never be eliminated from any enterprise; therefore, is it not the part of wisdom to encourage all possible development of water power resources on lines as indicated, to the end that the present, as well as future generations, may thus conserve our natural resources? Also, to the end that the dense smoke and begrimed, cinder laden atmosphere, engendered by the use of coal and other combustibles in making power may, as far as possible, be supplanted by electricity generated by water power, which brings more sunshine, better health and happiness. If so, why hamper present development? We need it now; and future generations under this plan are fully protected. May we quickly open the floodgates of opportunity to individual initiative, and thus will a more abundant progress await all our combined interests.

To sum up: Under the plan proposed herein, doubtless capital would be encouraged. Quick development would not be palsied. Stock and bond issues would be more stable and innocent holders' rights protected. Manipulation would be reduced to a minimum. Capital and the people's interests would be yoked together in one common interest. Eternal wrangling would largely cease. General confidence, that great bulwark of all progress, would be uppermost. In the just division of profits, equity would reign supreme. Is this not a righteous solution of these complex problems?

THE PRODUCTION, THE CONSUMPTION AND THE PRICE OF THE MINOR METALS IN THE LAST TEN YEARS

By Édouard Payen

Translated from "L'Economiste Français"

IN a previous article* appearing in these pages the course of the production, consumption and prices of copper and lead were dealt with. This article will deal with zinc, tin, aluminum and nickel from the same point of view. These metals, occupying as they do a considerable place in the industrial field, are well worth examining as to their position on the eve of a conflict which involves most of the great industrial countries of the world and, consequently, almost all those which were the chief consumers of the metals in question.

ZINC.

The world's production of zinc made considerable progress in certain years of the last decade. Although last year the increase was only 20,000 tons, or 2.5 per cent, it reached 75,800 tons in 1912, or 8.4 per cent, as compared with the preceding year and 85,000 tons, or 10.5 per cent, in 1910. The production suffered a set-back in only one of the last ten years, 1908, and, since 1909, an amount of zinc markedly greater than in 1907 has been produced. The countries which participated in the increase of the past year were: the United States, Germany, Holland, Great Britain, Austria, Italy and Norway. The American production amounted to 165,850 tons in 1904 and 320,283 tons in 1913, as compared with 314,512 tons in 1912. The decline in the world's production pointed out in 1908 was due to the United States, where the output fell off from 226,838 tons, in 1907, to 189,941 tons in 1908, but recovered to a figure of 240,446 tons in 1909. In 1907, the United States wrested from Germany first rank among the zinc producing nations with 226,838 tons, as compared with a German production of 208,707 tons. This position was lost again in 1908, with the moderate production which has been indicated, but was regained in 1909 with 240,446 tons, as compared with a German production of 220,080 tons, and the United States now seems definitely fixed in first place. The German production increased from 191,060 tons in 1904 to 271,064 tons in 1912 and 283,113 tons in 1913. This total production was divided almost entirely between Rhenish Westphalia, with a share of 92,852 tons in 1913, against 65,388 tons in 1904, and Silesia (170,119 tons in 1913, against 125,672 tons in 1904). Holland has witnessed an increase in output from 13,099 tons in 1904 to 24,323 tons in 1913, which compares with 23,932 tons in 1912. The production of Great Britain jumped from 46,216 tons in 1904 to 59,146 tons in 1913, as compared with 57,231 tons in 1912. The larger figure of the decade was 66,956 tons, in 1911. The Austro-Italian output shows notable development. It has increased from 9,248 tons in 1904 to 21,707 tons in 1913, compared with 19,604 tons in 1912 and 16,876 tons in 1911. The Norwegian production, which was 6,680 tons in 1904, reached 8,128 tons in 1912 and 9,287 tons in 1913.

The countries in which the zinc production fell off in 1913 are: Belgium which, after having increased its output from 139,982 tons in 1904 to 200,198 tons in 1912, fell off to 197,703 tons in 1913; France and Spain whose production advanced from 49,082 tons in 1904 to 72,161 tons in 1912, and declined again to 71,023 tons in 1913. The Russian output shows no progress, the highest figure of the decade being for 1904 (10,606 tons) and the lowest that for 1913 (7,610 tons), which compare with 8,763 tons in 1912 and 9,936 tons in 1911.

The two largest zinc producers of the world are also the two largest zinc consumers. In 1904, the United States and Germany were about equal, the former absorbing 157,100 tons and the latter 151,600 tons; but the consumption of the United States has developed much more rapidly and the figures for 1913 show a consumption for the United States of 313,000 tons and for Germany of 232,600 tons. The balance in favor of the United States, which was in 1904 only 5,500 tons, is now 81,300, which shows clearly the progressive activity of the United States from the industrial point of view.† The consumption of Great Britain, which was 129,100 tons in 1904, reached 185,200 tons in 1912 and 194,600 tons in 1913; that of France has increased from 67,200 tons in 1904 to 82,000 tons in 1912 and 81,000 in 1913; that of Belgium from 52,000 tons in 1904 to 77,200 tons in 1912 and 76,400 tons in 1913; that of Austria-Hungary from 25,300 tons in 1904 to 46,800 tons in 1912 and 40,400 tons in 1913; that of Russia from 23,500 tons in 1904 to 27,900 tons in 1912 and 33,300 tons in 1913; and that of Italy from 5,100 tons in 1904 to 10,900 tons in 1913, having more than doubled in a decade.

In 1912 the average annual price of zinc was the highest in many years. It is necessary to go back to 1873 to find an average price anywhere near analogous, it being in that year £26 3s. 6½d. sterling per ton of 1,016 kilograms [2235.2 pounds]. For a period of forty-six years (that is, since 1868), the average annual price has twenty-two times been below £20 sterling,—namely, in 1870 and 1871 (a little above £18 sterling); from 1877 to 1889 inclusive

*See THE MARKET WORLD AND CHRONICLE, issue of September 5, 1914.

†For the production and consumption of zinc in the United States, see article by M. Pierre Leroy-Beaulieu, "L'Économiste Français," February 7, 1914.

(in this period came the lowest average price in forty-three years, that of £13 19s. 11d. in 1885); and from 1893 to 1897 and in 1901 and 1902, the prices quoted in the last two years being £17 0s. 7d. and £18 19s. 11d., respectively. A few days before the actual crisis at the end of July, 1914, zinc was quoted at £21 5s. 8d.

In the following table are given the general figures for the last ten years:‡

THE PRODUCTION, CONSUMPTION AND AVERAGE PRICE OF RAW ZINC DURING THE LAST TEN YEARS.

	1904.	1905.	1906.	1907.	1908.
World's production (in tons of 2,200 pounds)	625,400	658,700	702,000	738,400	722,100
Consumption	629,300	663,800	705,200	743,200	730,500
Average annual price at London pounds sterling)	£22-11-10	£25-7-7	£27-1-5	£23-16-9	£20-3-6
Value of the production (in thousands of marks)	284,000	336,000	382,000	353,600	297,200
	1909.	1910.	1911.	1912.	1913.
World's production (in tons of 2,200 pounds)	783,200	816,600	902,100	977,900	997,900
Consumption	798,900	827,000	911,400	996,900	1,012,700
Average annual price at London (pounds sterling)	£23-3-0	£23-0-0	£25-3-2	£26-3-4	£22-14-3
Value of the production (in thousands of marks)	348,800	377,700	456,400	514,000	455,700

TIN.

Tin is a metal the production of which is not very ample and the price of which rules very high if compared with that of the three metals previously discussed. The production of the entire world, in 1913, was only 128,900 tons, against 103,100 tons in 1904. The mines of the Detroit region in 1913 produced 65,640 tons of 1,000 kilograms [2,200 pounds], 63,466 tons of which were absorbed in Europe and America, and 2,174 tons in the British Indies and in China. Great Britain gets its tin from its own ores (about 5,300 tons in 1913), and from foreign ores which comes from Bolivia. These latter ores furnished 16,700 tons of 1,000 kilograms in 1913, against 13,600 tons in 1912 and 7,450 tons in 1904. England's total production in 1913 was, thus, about 22,000 tons, as compared with 11,500 tons in 1904. Germany also refines the ore, mostly from Bolivia, and its output has increased from 5,000 tons in 1904 to about 11,000 tons since 1911. The sales of "Banka" tin, in Holland, amounted to 11,735 tons in 1904 and 15,173 tons in 1913, compared with 16,111 in 1912 (the last is the maximum figure of the decade, while the minimum figure was that for 1906, 9,450 tons). The sales of "Billiton" tin, in Holland and Java, are considerably less important, being about 2,200 tons annually. Australia produced 5,300 tons in 1904, and 4,870 tons in 1913, as compared with 5,130 tons in 1912; the largest output of the decade was in 1906 (7,400 tons). China exported, in 1912, 8,782 tons of tin. It is estimated that the figure for 1913 was less sizeable and may, perhaps, not have exceeded 6,000 tons.

The United States, which does not appear in the table of the producers of tin, is the largest consumer of this metal, which is indispensable to the great industrial nations. The consumption of it in the United States has increased from 37,400 tons in 1904 to 51,700 tons in 1912, falling to 45,000 tons in 1913. The other countries which, along with the United States, have witnessed a decline in consumption during 1913 are: Germany, with 19,300 tons, against 20,200 tons in 1912 and 16,400 tons in 1904; and Austria-Hungary, with 3,200 tons, against 3,800 tons in 1912 and 3,400 tons in 1904. England has a greater consumption of tin than Germany, although ordinarily it is exceeded by the latter country in the consumption of metals, particularly in zinc, copper and lead. This pre-eminence on the part of Great Britain is explained, in part, by the fact that that country is a large manufacturer of tinned sheet iron. The English consumption has risen from 18,600 tons of 1,000 kilograms in 1904, to 21,000 tons in 1912 and 24,400 tons in 1913. The French consumption, which has always stayed above 7,000 tons annually (except in 1907, when it fell to 6,700 tons), reached 8,300 tons in 1913, as compared with 7,500 tons in 1912. The Belgian consumption increased from 1,500 tons in 1912 to 2,300 tons in 1913.

‡This table, as all figures cited in this article, are taken from the statistics of the "Metallgesellschaft."

As for the metals previously treated with, there is given below a summary table as regards tin for the last ten years:

PRODUCTION, CONSUMPTION AND AVERAGE PRICE OF RAW TIN DURING THE LAST TEN YEARS.

	1904.	1905.	1906.	1907.	1908.
World's production (tons of 2,200 pounds)	103,100	102,400	104,400	102,400	113,400
Consumption	103,200	104,600	107,600	104,600	101,900
Average annual price (pounds sterling)	£126-14-8	£143-1-8	£180-12-11	£172-12-9	£133-2-6
Value of the production (thousands of marks)	262,800	294,600	379,300	355,500	303,500
	1909.	1910.	1911.	1912.	1913.

Average annual price (pounds sterling)	£134-15-6	£155-6-2	£192-7-1	£209-8-5	£201-13-7
Value of the production (in thousands of marks)	306,500	358,500	454,800	525,100	522,700

As for the prices for tin, they have shown wide variations. Following a period of very high prices, there was, in the second half of 1913 and the first half of 1914, a considerable decline.§ In the last few days of July, 1914,—that is to say just before the opening of hostilities,—tin was quoted at £132 sterling, as compared with £182 1s. 4d. and £202 1s. 2d. at the same season in 1913 and 1912, respectively.

Some idea of fluctuations of the average monthly price of tin may be had from the following table, which gives the range of prices during the first and the last two years of the past decade:

THE AVERAGE MONTHLY PRICE OF TIN IN 1903, 1912 AND 1913.
(In Pounds Sterling per ton of 2235.2 pounds.)

	1903.			1912.			1913.

ALUMINUM.

Aluminum furnishes an example of what progress in industrial technique and the influence of new industries can do. In 1904, the production of this metal amounted still to only about 9,300 tons annually. But, in 1913, the production had reached 68,200 tons. Below are given some of the steps by which this magnificent result was reached:

THE PRODUCTION OF ALUMINUM, 1904-1913.
(In Tons of 2235.2 Pounds.)

	1904.	1905.	1906.	1907.	1908.
United States, Canada*	3,900	4,500	6,000	8,000	6,000
Germany, Austria-Hungary, Switzerland	3,000	3,000	3,500	4,000	4,000

Average price (marks)	1.35	1.45	1.20	1.50	1.70

*These figures are estimates, the manufacturers not making known the total of their production.

The growth of the production of aluminum in France is particularly noticeable in this table. Although, in 1909, that country could boast an output of only 6,000 tons, or less than half of the United States production of 13,200 tons in the same year, its output is now 18,000 tons, as compared with 22,500 for the United States. The advance in its production has thus been remarkably rapid. This is due to the richness of France in white coal and bauxite, the prime materials in aluminum. The demand for this metal is constantly growing and its usages multiplying. The automobile and electrical industries use much of it, and kitchen utensils are more and more being made from it. As regards its price, it is interesting to recall that, in 1886, aluminum was still being sold at 100 marks [1 mark equals 23.8 cents] per kilogram [2.2 pounds], after being quoted at 240 marks in 1857, 300 marks in 1856 and 1,000 marks in 1855.

NICKEL.

The growth of nickel, although considerable, cannot be compared with that of aluminum. The world's production has increased from 12,000 tons in 1904 to 28,500 tons in 1912 and 30,000 tons in 1913. The United States and Canada furnish about half of this output; then come Germany and England, with an almost equal production of about 5,000 tons each, and France with a little over 2,000 tons.

Nickel is extracted from an ore of which New Caledonia provides the greater part,—93,190 tons in 1913, as compared with 72,315 tons in 1912 and 120,060 tons in 1911, the highest figure of the decade being 125,300 tons in 1905. The production of this ore in Canada has made some progress, increasing from 4,800 tons in 1904 to 20,300 tons in 1912 and 22,500 tons in 1913.

Thus ends the consideration of the metals which the English class under the head of "the minor metals." A comparison of the consuming countries with the countries whence these metals, or the raw materials which are used in the making of them, are drawn, makes it at once apparent that Germany will find herself put to it, due to the fact that the sea is closed to her, to provide herself with some of these metals. This is one of the first facts which becomes evident in the present posture of affairs. On the other hand, the figures that have been given covering the last ten years show that, as regards all these metals, development has taken place and that for some the advance has been considerable, as for example in aluminum. The present world-wide crisis will mark, without a doubt, a time of retrogression in this respect; but with the return of peace, the consumption of these various metals will expand with great activity, for their use is closely interwoven with the advance of modern industry and war is a tremendous destroyer of articles in the manufacture of which these metals are freely used. To consider, as one example, only [illegible] a number of which are used in military operations, there appears a large outlet, in the near future, for [illegible] the work of restoration which will be [illegible].

§See, on this subject, article on tin in "L'Economiste Français," June 20, 1914.

INDUSTRY, COMMERCE AND FINANCE

The Foreign Trade of the United States in October.—Continued improvement in the trade position of the United States is indicated in the statement issued by the Department of Commerce covering foreign trade in October. The export balance for the month was $57,305,074, or nearly as great as the total export balance for the previous nine months of 1914. However, the country's export balance for the first ten months of this year, as compared to the ten months' figures for 1913, fails to show relative improvement, because the export balance for October, 1913, amounted to the record sum of nearly $140,000,000.

Imports for October, 1914, showed a falling off of over $2,000,000 from the import value in September, 1914, but were actually more than $5,000,000 in excess of the imports during October a year ago. For the first ten months of 1914 the imports show an increase over the corresponding period in 1913 of over $78,000,000. The actual import value for October, 1914, was $137,978,778.

Exports for the month reached the value of $195,283,852. This is an increase of $39,000,000 over the value for the previous month, but is more than $76,000,000 below the total in October, 1913. This falling off from last year's figures is due entirely to the decline in cotton exports which showed a value of $86,955,154 below that for the month of October, 1913. If cotton shipments had equaled the 1913 value, the October, 1914, exports would have shown a gain of $10,000,000 over the figure for October, 1913.

The following table shows the 1914 imports and exports by months, with the excess of imports or exports in each month, and also the figures for the first ten months of 1914 and 1913:

FOREIGN TRADE OF THE UNITED STATES BY MONTHS, 1914.

	Imports.	Exports.	Excess.
October	$137,978,778	$195,283,852	Exp. $57,305,074
September	139,204,267	156,188,790	Exp. 16,984,423
August	129,399,496	110,337,545	Imp. 19,051,951
July	160,178,133	154,082,225	Imp. 6,095,908
June	157,772,973	157,119,451	Imp. 653,522
May	164,281,515	161,732,619	Imp. 2,548,896
April	173,762,114	162,552,570	Imp. 11,209,544
March	182,555,304	187,499,234	Exp. 4,943,930
February	149,937,011	173,808,468	Exp. 23,871,457
January	154,469,263	203,799,517	Exp. 49,330,254
Total 10 months, 1914	$1,548,429,652	$1,662,685,841	Exp.$114,256,189
Total 10 months, 1913	1,460,334,373	2,005,282,622	Exp. 544,948,249

Gold imports for October, 1914, amounted to $5,934,866, an increase of approximately $500,000 over the figure for October, 1913. The gold imports in September of this year reached the value of $2,761,590.

Exports of gold during October amounted to $50,341,972, as against $21,867,392 in September, 1914, and $483,780 during the same month a year ago. The excess of exports over imports for the month amounted to $44,407,106, as compared to an export excess of $19,105,802 last month.

For the ten months, imports of gold amounted to $45,876,812, as compared with $51,590,693 for the first ten months of 1913. Exports amounted to $207,998,753, as compared with $74,563,059 for the corresponding period last year. The gold export balance for 1914, therefore, stood at $162,121,941 at the beginning of the present month. For the first ten months of 1913, the gold export balance was $22,972,466, and for that year, $8,568,597.

* * *

Railway Revenues and Expenses in the United States in August. According to figures issued by the Bureau of Railway Economics, for railways operating 227,184 miles of line, or almost 90 per cent of all steam railway mileage in the United States, operating revenues for the month of August, 1914, amounted to

$266,928,165. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail and auxiliary operations. Compared with August, 1913, these operating revenues show a decrease of $12,496,358. Total operating revenues per mile averaged $1,175 in August, 1914, and $1,244 in August, 1913, a decrease of $69, or 5.6 per cent.

Operating expenses, which include the cost of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $179,163,880. This was $12,989,650 less than for August, 1913. These operating expenses per mile of line averaged $789 in August, 1914, and $856 in August, 1913, a decrease of $67 per mile, or 7.8 per cent.

Net operating revenue, that is, total operating revenues of rail and auxiliary operations less operating expenses, amounted to $87,764,285, which was $493,292 more than for August, 1913, but that this increase is due to increase in mileage is shown by the fact that net operating revenue per mile decreased. Net operating revenue per mile of line average $386 in August, 1914, and $388 in August, 1913, a decrease of $2 per mile, or 0.6 per cent.

Taxes for the month of August amounted to $11,288,351, or $50 per mile, an increase of 0.7 per cent over August, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less taxes, averaged $336 per mile of line, and in August, 1913, $339, thus decreasing $3, or 0.8 per cent. Operating income for each mile of line for each day in August averaged $10.85 and in August, 1913, $10.95. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

The operating ratio for August, that is, the per cent of total operating revenues absorbed in operating expenses, was 67.1 per cent, which is comparable with 68.2 per cent in August, 1913, and 64.0 per cent in August, 1912. The operating ratio in the Eastern district for August was 67.3 per cent, as compared with 70.0 per cent for August, 1913; was 74.2 per cent in the Southern district as compared with 74.2 per cent in 1913; was 64.5 per cent in the Western district, as compared with 65.5 per cent in 1913.

When the returns for the eight months of the calendar year 1914 are compared with those of the corresponding months of 1913, they show a decrease in total operating revenues per mile of 6.2 per cent, a decrease in operating expenses per mile of 4.8 per cent, and a decrease in net operating revenue per mile of 9.8 per cent. This net operating revenue per mile decreased 15.0 per cent in the East, as compared with the corresponding period of the previous year, decreased 3.6 per cent in the South, and decreased 6.6 per cent in the West.

* * *

The United States Rice Production for the Season, 1913-1914.—Secretary J. R. Leguenec, statistician of the Rice Millers' Association, has issued his annual report on the United States rice crop covering the period from August 1, 1913, to July 31, 1914, in detail. The total production of rough rice in 1913 was 6,249,892 sacks, on an acreage estimated by the Association at 689,908 acres. Of the crop it is estimated that seed was reserved for this acreage at 90 pounds to the acre, which left a milling supply of domestic rice of 5,904,938 sacks.

The carryover in the hands of mills on July 31, 1914, was 46,752 bags of rough and 297,910 pockets of clean, a total of clean and rough of 344,662.

The total distribution of edible domestic rice, not including brewers', was 6,322,014 pockets. The distribution of domestic brewers' was 758,641 pockets, making a total distribution of domestic, including brewers', of 7,080,655 pockets.

The consumption of edible rice includes 6,323,014 pockets of domestic, 1,013,030 pockets of imports of cleaned rice and 324,176 pockets of uncleaned, making a total supply for distribution of 7,659,220 pockets of edible rice, not including brewers'. Of this, 184,547 pockets were exported and 1,340,749 shipped to Porto Rico, leaving a total for consumption in the United States of 6,133,524 pockets, domestic and foreign, not including brewers' rice.

Brewers' rice produced in the United States amounted to 758,641 pockets and the imports of brewers' amounted to 1,359,291 pockets. The total American rice supply, foreign and domestic, including edible rice and brewers' rice, was therefore as follows: Total supply edible rice, 7,659,220 pockets; domestic brewers', 758,641 pockets; imported brewers', 1,359,291 pockets; total, 9,775,152 pockets.

Mr. Leguenec states that the per capita consumption in the United States is 6.81 pounds, while the per capita consumption in Porto Rico is 120 pounds.

* * *

The World's Production of Crude Petroleum.—The predominance of the United States in the world's production of petroleum has been steadily increased since 1905. At the present moment when an unusual demand has arisen in Europe it is particularly opportune to review the sources of petroleum supply. The London "Statist" has gathered, with considerable difficulty, it is asserted, statistics as to petroleum production, which are published in the issue of that paper of October 24, 1914. The "Statist" prints two tables; the first showing the output of the United States and Russia from the time of the discovery of petroleum in Pennsylvania in 1860 up to 1899 when the Russian output had almost equaled that of the United States. This joint output amounted to more than 90 per cent of the world's supply in the latter year. This table is given below:

CRUDE PETROLEUM PRODUCTION.

(Barrels of 42 Gallons.)

	U. S. A.	Russia.		U. S. A.	Russia.
1860.....	500,000	.....	1890.....	45,823,000	25,548,000
1870.....	5,260,000	.....	1891.....	54,292,000	30,785,000
1881.....	27,661,000	4,262,000	1892.....	50,514,000	31,857,000
1882.....	30,350,000	5,357,000	1893.....	48,431,000	37,929,000
1883.....	23,449,000	6,404,000	1894.....	49,344,000	33,024,000
1884.....	24,218,000	9,619,000	1895.....	52,892,000	40,309,000
1885.....	21,859,000	12,404,000	1896.....	60,960,000	41,262,000
1886.....	28,065,000	16,024,000	1897.....	60,475,000	45,119,000
1887.....	28,283,000	17,643,000	1898.....	55,364,000	51,952,000
1888.....	27,612,000	20,524,000	1899.....	57,071,000	56,143,000
1889.....	35,163,000	21,904,000			

"In the nineties a variety of new fields of production were discovered," the "Statist" continues, "but not until the beginning of the subsequent decade was the output of new fields of any distinct importance. The new producers in Europe were Rumania and the Eastern Provinces of Galicia in Austria, and outside Europe the Far East—Dutch Indies and British India—entered the producing stage. The search for oil was stimulated by the discoveries made in new regions, and other fields have subsequently been found to exist. Prominent among them Mexico, where the growth in the last three years has been phenomenally rapid and large. Sporadic discoveries have been made all over the world, and in reference to them attention may be called to the great possibilities that are presented in respect of Persia, where the British Government has secured an interest over a large area; and Egypt also presents potentialities. For years past Canada has been a producer on a small scale, but reported fresh discoveries may have importance."

The article concludes with a mention of the discovery of new fields in the United States. It is pointed out that the bulk of production was for a long time confined to the fields where oil was first discovered—Pennsylvania, New York, West Virginia and Ohio.

In the late nineties discoveries were made in California, so that 3,324,000 barrels were produced in that State in 1900 and 90,751,000 barrels in 1913. Texas followed in 1901, and by 1905 had established a maximum output of 28,000,000 barrels. Greatest of all was Oklahoma whose output was 10,000 barrels in 1901 and over 62,000,000 in 1913.

The second table given by the "Statist" shows the world's production of crude petroleum for 1901, and from 1905 to 1913. The quantities are expressed in terms of barrels of 42 gallons. It is stated that "as quantities are sometimes expressed in tons of 2,240 pounds or metric tons of 2,204 pounds, for purposes of uniformity, specific gravity ignored, the ton of either description may be taken as 7⅓ barrels." It may be added that the figures in the table covering the United States correspond with those given in the Statistical Abstract of the United States, published by the Department of Commerce. The table follows:

WORLD'S PRODUCTION OF CRUDE PETROLEUM.
(In Barrels, 42 Gallons.)

	U. S. A.	Russia.	Mexico.	Roumania.	(Borneo, Java, Sumatra).
1901	69,389,000	85,168,000	.....	1,678,000	4,013,000
1905	134,717,000	54,960,000	.....	4,421,000	7,850,000
1906	126,494,000	58,897,000	.....	6,378,000	8,180,000
1907	166,095,000	61,850,000	1,000,000	8,118,000	9,982,000
1908	178,527,000	62,186,000	3,481,000	8,252,000	10,283,000
1909	183,171,000	65,970,000	2,488,000	9,327,000	11,042,000
1910	209,556,000	70,336,000	3,332,000	9,723,000	11,030,000
1911	220,449,000	66,183,000	14,051,000	11,102,000	12,173,000
1912	222,113,000	67,826,000	19,404,000	13,251,000	11,146,000
1913	247,148,000	69,483,000	26,488,000	13,823,000	11,205,000

	Galicia.	British India.	All Other.	World's Total.
1901	3,251,000	1,431,000	2,000,000	166,930,000
1905	5,765,000	4,137,000	3,000,000	214,850,000
1906	5,468,000	4,016,000	3,479,000	212,912,000
1907	8,456,000	4,344,000	4,402,000	264,247,000

1909	14,933,000	6,676,000	4,717,000	298,324,000
1910	12,673,000	6,138,000	4,681,000	327,469,000
1911	10,485,000	6,451,000	4,615,000	345,509,000
1912	8,653,000	7,340,000	5,866,000	355,599,000
1913	7,993,000	8,066,000	6,600,000	390,806,000

* * *

Proposed Agricultural Mortgage Bank for Costa Rica.—In July last the President of the Republic of Costa Rica addressed a special message to the House of Deputies recommending the establishment of an Agricultural Mortgage Bank. The message was accompanied by a proposed bill which provided, among other things, the following: That the business of the bank shall consist in the issue of mortgage bonds, the collections of sums due the bank, the payment of interest to the holders of mortgage bonds, and the liquidation at par, out of the amortization fund, of mortgage bonds when they fall due. The bonds are to be issued in denominations of 50, 100, 200, 500, and 1,000 colones (colon equals $0.465) or the equivalents in foreign money. These bonds are to be issued in the names of their owners or to bearer, as may be desired, and are transferable and negotiable. Bonds issued in the names of the holders are transferable by indorsement. Mortgage bonds issued on property are payable to the bank only in such sums and for such period of years as may be specified in the contract. The interest shall not exceed 10 per cent per annum, the amortization fund shall not be less than 1 per cent, and the fund for the expense of administration shall not exceed one-half of 1 per cent per annum. The bank is prohibited from issuing bonds except for the amount of the mortgages made in its favor. Each mortgage bond shall be recorded in a special register. The value of the mortgaged property shall be ascertained by one or more experts appointed by the bank. The proposed bank shall be called "National Agricultural Mortgage Bank," and its headquarters shall be in San Jose, but it has authority to establish branches and agencies in other points of Costa Rica or abroad, if it should deem advisable. The initial capital of the bank shall not be less than 8,000,000 colones, which may be increased to 50,000,000 colones if business transactions should so require. The duration of the bank shall be for a period of thirty years, during which time it shall have the exclusive privilege of issuing mortgage bonds. The bank may have two sections—one commercial, which shall be subject to the regular banking laws of the country, and the other the mortgage section. The maximum rate of interest to be charged by the commercial section shall not exceed 10 per cent per annum; that of the mortgage section 8 per cent for loans of over three years and 9 per cent for shorter-term loans. The bank may also issue bank notes. The proceeds of the mortgage bonds sold abroad shall be invested in Costa Rica in new issues of mortgage bonds. The capital, shares, bonds, and other property of the bank are exempt from federal taxation. The President of the Republic is authorized to expend up to 50,000 colones in payment of the expenses required to be incurred in the establishment of the bank, and is also authorized to issue rules and regulations for the government of the bank.

* * *

Increase of Government Appropriations.—The following table compiled by the "New York Sun" is of present interest. It sets forth the amounts appropriated by Congress for the support of the Government for the years 1913-14 and 1914-15, as compiled from the chronological history of appropriation bills, second session of the Sixty-third Congress, prepared by the clerks to the Committees on Appropriations of the House and Senate; cents being disregarded:

Title.	Law 1914-15.	Law 1913-14.
Agriculture	$19,865,832	$17,986,945
Army	101,019,212	94,266,145
Diplomatic	4,309,856	3,730,642
District of Columbia	12,172,539	11,383,739
Fortification	5,627,700	5,218,250
Indian	9,771,902	9,486,819
Legislative	37,630,229	35,172,434
Military Academy	997,899	1,099,302
Navy	144,868,716	140,800,643
Pension	169,150,000	180,300,000
Post office	313,364,667	285,376,271
River and habor	.....	41,073,094
Sundry civil	110,070,227	116,795,327
Totals	$928,848,783	$901,616,520
Deficiencies	23,363,587	28,074,912
Totals	$952,212,370	$929,691,433
Miscellaneous	6,000,000	388,597
Annual totals	$958,212,370	$930,080,030
Permanent	131,196,407	127,525,664
Grand totals	$1,089,408,777	$1,057,605,694

No river and harbor bill has been passed for this year, and therefore this appropriation for both years is excluded from the grand totals for purposes of comparison. The pension appropriation, for obvious reasons, is decreased by $11,000,000; the Military Academy bill is $100,000 less than was allowed for last year; the sundry civil bill is down by $6,725,000. But generally there are increases.

A comparison of total appropriations, excluding the river and harbor appropriations, for a series of years shows the following record:

Year.	Amount.	Year.	Amount.
1911	$978,521,087	1914	$1,057,605,694
1912	995,799,462	1915	1,089,408,777
1913	988,353,340		

INSURANCE

Articles on the Theory, Practice and Experience of Insurance.
Notes on Insurance, American and Foreign.
Items of Insurance News.

MARINE underwriters and the cotton trade are both following with intense interest the latest developments in connection with the shipment of cotton from the United States to Germany. The American cotton producer likewise is not indifferent, nor are our bankers, North and South. It is known that Germany is in desperate need of cotton and that whatever cotton can be got to that country can be sold at a price approximately three times as high as that now current in the Southern markets, while normally the German price should be only two or three per cent higher than the American price. From a commercial point of view, then, a veritable fortune can be made from even a very moderate shipment of cotton to Germany, if only it can surely be got into that country. On the other hand, every bale of cotton that can be sold in Germany diminishes by so much the price-depressing burden of our vast surplus of cotton. All motives, therefore, exist for procuring the shipment of cotton to Germany; and, curiously enough, the obstacles to such shipment have all along appeared to be unsubstantial, despite the reality of their effect. Cotton is not contraband or conditional contraband of war under the terms of the Convention of London; moreover, the English Government has included cotton in neither of the lists of contraband issued by it, and besides, has virtually assured our own Government that there is no intention to seize cotton in transit to Germany and Austria or to interfere with its shipment thither in American or other neutral bottoms. And yet, with the exception of the single cargo of the "Aurora" in mid-September, not one ship-load of cotton, so far as is known, has reached a German port from the United States since the outbreak of the war.

The trouble has, of course, been chiefly the impossibility of obtaining marine insurance upon ships and cargoes. Some difficulty there was at the start by reason of the fact that practically all of the cargo boats in the cotton trade belonged to one or another of the warring nations and became immediately unavailable for this reason. But as time has gone on, and particularly as more and more ships have been admitted to American registry, this problem has ceased to be insoluble. Ships in abundance can now be found of suitable ownership to enable them to take cargoes of cotton to Bremen, the cotton port *par excellence* of Germany. But notwithstanding this fact it has seemed until within the past few days that direct shipments could not be compassed. Without marine insurance nothing could be done and the requisite marine insurance was unobtainable. It must be remembered that this insurance, under the existing conditions, has to be of two kinds,—the insurance of the marine risk proper and the insurance of the war risk. Furthermore, the insurance of a cargo against these two risks is one thing and the insurance of the ship herself is another. For it is a principle of the marine underwriting of hulls that the owners must be co-insurers to the extent of 20 per cent at least. Again, insurance is practically unobtainable in war time against the loss to the ship owners occasioned by the detention of the ship in a belligerent port, pending the determination of the contraband or non-contraband character of her cargo. Clearly, then, while the shipper of a cargo of cotton to Bremen might obtain both marine and war-risk insurance of the full value of his cotton, the ship owner must himself assume the risk of losing at least twenty per cent of the entire value of the ship, should she strike a mine, and of the loss and expense incident to the detention of the ship in a belligerent port, should she be taken into such a port for the determination of the character of her cargo.

The real difficulty in the way of the direct shipment of cotton to German ports has been the impossibility of obtaining insurance against these risks of the ship, rather than lack of insurance for the cotton itself. It is true that both the great British marine insurance companies and London Lloyds have, under Government compulsion, declined to insure any ship or its cargo against the risk of seizure or detention by the war vessels of the Allies, no matter what guaranty might be given of the non-contraband character of the cargo. The Continental marine insurance companies are virtually writing no business at all of any kind. But there are some American companies and there is also the War Risk Bureau of the United States Treasury. From these a moderate volume of insurance of cargoes in American or other neutral bottoms has undoubtedly been obtainable, even for voyages to Bremen or Hamburg direct. There has, however, remained the immutable law of marine insurance with respect to the ships themselves, that they must not be insured for more than 80 per cent of their value, nor against the completely incalculable losses and expenses of detention in belligerent ports. Here has been the stumbling block.

During the past week there have been signs that the urgency of the cotton situation in Germany, combined with the eagerness of the United States to find an outlet for some of the surplus cotton in the South, has led to such readjustments that direct shipments of cotton to Bremen will shortly be under way. On Thursday, it was announced in Washington that the War Risk Bureau of the Treasury Department is now willing to accept war risk insurance on ships and cargoes of cotton bound for Bremen. It is reported also that a way has been found to get over the difficulty of the required 20 per cent co-insurance on the hulls and of the risk of loss and expense to the ship owners through detention at belligerent ports. The method here is the comparatively simple one of making the freight rate on the cotton or the *per diem* of the charter party high enough to cover these risks, in addition to yielding the normal return for the use of the ship. It is estimated that a freight rate of about $2.50 per 100 pounds (compared with a normal rate varying from 45 cents to 60 cents) from South Atlantic and Gulf ports to Bremen provides the ship owner with the necessary insurance against the risks which he cannot have underwritten. The practical working out of this may be illustrated somewhat as follows: The value of a ship with a capacity of 8,000 bales of cotton is approximately $400,000. At a normal freight rate of 50 cents per hundred pounds, or $2.50 per bale, such a boat would earn, gross, from Galveston or New Orleans to Bremen the sum of $20,000. But the owner must himself carry 20 per cent, or $80,000, of the insurance of the ship's hull. At a freight rate of $2.50 per 100 pounds, or $12.50 per bale, the total freight is $100,000. Hence, if the owner receives this freight rate, his boat may be destroyed by a mine in the North Sea, and still he will have received enough in freight money to pay his share of the loss on the ship and his normal return for a voyage of the ship to Bremen. The boat, however, may escape destruction from mines; and for this chance of an enormous profit the owner is willing to assume the risk of detention at a belligerent port. Some such basis of calculation, it is understood, is being used in connection with the direct shipment of cotton to Germany. In other cases, the same result is obtained by a high *per diem* charge for the charter party, leaving the risk of detention to be borne by the shipper. On these general terms it seems probable that considerable direct shipments of cotton to Germany may be made.

THE PLANS FOR THE EIGHTH ANNUAL INTERNATIONAL CONGRESS OF ACTUARIES

WITH England, France, Germany and Russia, the four greatest powers in all Europe, embroiled in the most terrific struggle of history, what the probabilities are for the holding of the various international gatherings planned for the year 1915, is a matter problematical to a degree. It is not as an introduction, merely, to a Congress, the meeting of which is to a high degree uncertain, that there is given below the programme arranged for the Eighth International Congress of Actuaries, scheduled to be held at St. Petersburg (Petrograd) from May 23 to June 5, 1915 (May 18-31, old style). The programme is of interest from this point of view, but its real value at the present time is that it indicates clearly what insurance problems, according to the world's best actuarial minds, are most in need of discussion. In a department of the world's business structure as tremendous and as important from the economic point of view as insurance, in which hundreds of thousands of men are daily advancing as many arguments, theories and practices, it is well to give the widest publicity to those things which tend to concentrate the effort and the brain power of the multitude of those interested in insurance, along fundamentally sound and effective lines. Through practically all the countries of the globe, it is too much to expect that there may be attained that perfect co-ordination and co-operation of endeavor which would bring the business of insurance to its point of highest efficiency and accuracy in the shortest space of time. It may be possible, however, gradually to correlate and to focus the efforts of the more forward-looking of those who stand out as leaders, with an obvious result of obtaining a greater driving force and of reducing the amount of waste motion. With this idea in mind, then, the programme is here submitted.

The programme is divided into subjects to be discussed by the Congress, and subjects not to be discussed, as follows:

(1) Subjects to be discussed by the Congress:

FIRST QUESTION.

The determination of probabilities and other quantities connected with social assurance. The consideration of a universal system of notation.

The programme of the Sixth Congress at Vienna included a comparison between the methods of calculations referring to social (collective) assurance and those of private (individual) assurance. It would be desirable to complete this comparison by a general survey of probabilities which are connected with national assurance and on which the present values of all assurance payments are based; also it would be of great value for this branch of actuarial calculation to establish a general system of notation on the principles already fixed for ordinary life assurance. The necessity of a general system of probabilities arises out of the fact that the conditions of social assurance are very complicated, and the events which are to be taken into consideration in calculation of probabilities are liable to variations of a more complex character than is the case in individual assurance. Besides probabilities of death and of survival for a certain combination of lives (e.g., the family of a workman), we have to take into consideration the occurrence of disablement of some of the members of the family (through illness, in some cases, disability caused by accident and by old age), the chances of recovering ability, those of death happening during the time of disability; moreover, we must introduce probabilities connected with the composition of the family, as the chance of marriage, of having a family of a certain number, with a given distribution of ages, etc. Those probabilities depend upon the particular weight given to certain sequences of events in national assurance and this fact to a great extent complicates their calculation.

Therefore, in spite of the extensive literature existing on this question, the principles of calculating probabilities for social assurance have not yet been fully established. Owing to the great number of combinations and to the variety of events in social assurance, a general system of notation would facilitate the study of the literature of this subject. All considerations which render a universal system of notation for ordinary life assurance desirable, are of still greater importance in this new branch of actuarial calculation, and its adoption would greatly lighten the work. Having this in view, it is proposed to put before the next Congress the following subjects:

1. A general survey of probabilities and other quantities connected with social insurance (e. g., commutation columns, present annuity values, single premiums for assurance, etc.)

2. A scheme of a general system of notation for the probabilities and for all auxiliary quantities connected with social assurance.

SECOND QUESTION.

The scope and limits of the compulsory clauses in assurance contracts.

Modern legislation (the German and Swiss laws) regulating assurance contracts exactly determines which of the clauses in the assurance contract cannot be altered by mutual agreement of the parties. The introduction of such clauses was intended to give the best protection to the policyholders. This question, however, still remains without any definite solution because of the conflicting interests of the parties to the contract and also, to some extent, on account of doubts of a general character. It would therefore be of great interest to review this question, particularly in connection with the practical application of the modern law of assurance contracts in order to determine:

1. To what extent the existing compulsory clauses tend to further or to impede the development of life assurance?

2. Which of those clauses appear to be a real protection to the policyholders, and which are of no practical use?

3. Besides this the question arises: What should be the objects of these clauses, taking into account the interests of both parties to the contract and, also, the development of the business of assurance from an economical point of view?

THIRD QUESTION.

The practical value of select tables.

The dependence of mortality upon the duration of assurance is a question of high practical importance. The problem of the measurement of the changes in mortality among assured lives cannot be solved satisfactory without taking into account the duration of assurance. Select tables give us the possibility of foreseeing more exactly the course of mortality in the future. In daily practice, however, select tables complicate the formulae. Hence arises the question: To what extent would the complication in the working be justified by a corresponding increase of precision?

FOURTH QUESTION.

The calculation of mathematical reserves on office premiums.

Actuarial science was originally developed in connection with whole life assurances subject to uniform annual premiums. In such cases the risk of the insurer does not remain constant throughout the whole term of the assurance, but gradually increases so that part of the premium must be reserved to meet the increased risk in the future. The theory of reserves necessary for this purpose has become one of the principal parts of actuarial science. Nevertheless, this theory soon met and still meets with opposition on the

part of those who found that it restrained them from the free disposal of surplus. New theories as to reserve of premiums were proposed, and though not always based on sound theoretical principles have proved to be of value for practical purposes. It would be desirable and in accordance with the requirements of modern science to revise the theory of reserves and to re-examine its principles, basing the theory not on net premiums, but on office premiums taken quite independently instead of being calculated by loading the net premiums.

FIFTH QUESTION.

The mortality among persons who have been disabled by accident.

The question of the mortality amongst injured persons steadily increases in importance with the spread of compulsory accident assurance, especially as the capitalization system of covering the payments made as compensation to the insured person is becoming more prevalent. Nevertheless, in spite of the thirty years' existence of this branch of social assurance, the mortality statistics amongst injured persons up to the present time remain in a rather rudimentary state. Usually such mortality investigations are carried on without distinguishing even these two main categories, i. e., disability by accident and disability by sickness. It would be desirable to have a general review of all the statistical data published on this question, together with more full and recent information, and further to consider the best means of studying the mortality and the rate of recovery amongst injured persons as a function of the age and duration of disability. In particular it would be important to institute a suitable classification of injured persons according to the degree of disability, occupation, kind of injury, etc.

SIXTH QUESTION.

The reserve of premiums from the legal, technical and economical points of view. The rights of the policyholders to the reserves against their policies.

Though from the standpoint of the actuary the character of the reserve appears to be more or less clearly defined, it is not so from the legal point of view. The principal divergence of these two points of view may be expressed in the following questions:

1. Does the accumulation of the reserves involve any kind of liability for the assurance company to the individual policyholders, or may it be looked upon merely as a reserve fund of the company, to which the policyholders have no rights whatever, and

2. If these reserves constitute any liabilities for the company, then of what kind?

It would be desirable thoroughly to elucidate the above question, not only in accordance with the existing laws, but also taking into account the economical and actuarial character of the reserves for insurance business. There arises further the question of the legal character of the reserves in the case of the winding up of an assurance company. Here it is very important to know: (1) What kind of liabilities arise in connection with the reserves; and (2) how far should extend, in respect to these reserves, the rights of preferential satisfaction of policyholders, as against other creditors of the assurance company in liquidation.

(2) Subjects not to be discussed by the Congress:

SEVENTH QUESTION.

The possibility of the application of the theory of stability of statistical series, of frequency curves and of the theory of correlation to actuarial calculations.

(a) The theory of stability of statistical series.

Actuarial calculations are based on average values of different probabilities calculated from observations previously made. Such averages are not always, however, in a definite way characteristic of the phenomena; not every average quantity can be called a typical one. The criterion for the character of the averages obtained from a given material is given by the theory of stability of statistical series or the theory of dispersion. The systematic basis of the theory was laid down a long time ago. The first indications were given by the French actuary Dormoy in the year 1874, and with the year 1876 there began to appear a series of papers by the German statistician Lexis; and lately the theory of dispersion has been widely developed by the followers of Professor Lexis. The methods of this study may be found in some of the best-known textbooks. It would be desirable to examine, in the papers submitted to the Congress, to what extent this theory is applicable to actuarial calculations.

(b) Frequency curves.

The method of the arithmetical mean applied to the statistical description of a given body of facts gives definite results only in those cases in which the frequency curves approximate to the Gaussian curve of error. But in the majority of cases statistics show quite a different form of distribution. This fact has been especially pointed out by Karl Pearson, who has built up a general theory of frequency curves. Actuarial statistics show a great many different complex frequency distributions, for instance, frequency curves of deaths among assured lives, frequency curves of the exposed to risk arranged according to age, etc. It would therefore be desirable to consider the applicability of Karl Pearson's theory to actuarial calculations.

(c) The theory of correlation.

In statistical investigations it is frequently necessary to ascertain the relations between the constituents of different groups. Karl Pearson proposed a method for the determination of these relations, known as the method of correlation. The practice of life assurance offers a large field for the application of this theory. For example: the determination of the correlation between the ages at death of blood relations appears to be of great value for the correct assessment of risks in life assurance. Also very important from the point of view of the theory of correlation seem to be investigations of this kind in the domain of hereditary diseases. As regards the rating of fire insurance risks, much valuable information may be obtained by considering the correlation between the fires and the character of the risks. It would be interesting to know to what extent these new statistical methods may be applied to actuarial questions.

EIGHTH QUESTION.

Comparison between the mortality among the general population of a country and the mortality among assured lives.

At the last Congress in Amsterdam, the Italian actuary, Toja, proposed to bring before the next Congress the question of a comparison between the mortality among the general population of a country and the mortality among assured persons. The comparison of the mortality of the different periods of one and the same class of persons was made at the New York Congress (especially the comparison of mortality among the general population at the beginning and the end of the nineteenth century), and at the last Congress, the comparison of mortality among persons assured at different periods was made. Now it is proposed to compare the mortality among persons belonging to one definite period, but taken under different conditions of observation: the whole population on the one side and the joint experience of mortality of assurance companies, on the other. It is generally recognized that these two categories present some important divergencies: the medical and natural selection on one side, and on the other the differences of the general conditions of life of the whole population and of the classes which furnish the largest percentage of policyholders, are the principal factors in determining the above stated divergencies. At different periods in different countries, however, and by differ-

ent forms of assurance (as the whole life, endowment, ordinary and industrial assurance) the mortality often varies in a very dissimilar manner, so that the question offers abundant material for investigation. It would be of particularly great interest to compare the mortality among assured and non-assured lives of like social groups (for example, according to occupation). Apart from the results obtained it would be interesting to note the methods applied to this investigation, by which this comparison may be effected in the most convincing manner.

NINTH QUESTION.

The evolution of assurance law.

The development of the business of assurance depends not only upon the demand for assurance on the part of the population and upon the initiative of private persons and organizations, but also upon the legislation and administration, regulating the course of operation of assurance undertakings. These have not always proved successful in improving the business of assurance. Therefore the study of assurance law ought to be included in the programme of actuarial Congresses. The assurance clauses are not always promulgated by means of corresponding legislative acts, but very often as is the case in France, originate in the development of the law by means of degrees and other administrative measures. These additions to the law, inasmuch as they bear a general character, are of importance for the full comprehension of this question, and may have their part in the study of the assurance laws. As generally assumed the law of assurance can be divided into two parts, namely, the laws regulating the operation of assurance undertakings, that is the law of the supervision of assurance (the German V. A. G.), and the laws which regulate the relations between the policyholders and assurance companies, known as the laws of assurance contracts (the German V. V. G.) In the first place, it would be desirable to have a summary of the different laws in operation in every country up to the time of the Congress at Vienna, stating the time when they were enacted and put in force, with exact reference to the publication where they first appeared. Further, as regards the laws enacted since the Congress at Vienna it would be useful to give the substance of the same, and the reasons which led to their enactment. It would be in like manner desirable to have in the papers put before the Congress a brief account of the different administrative promulgations qualifying or developing the laws of assurance, and information concerning the legislative and administrative acts regulating the operations of the different pension funds; concerning the rates and taxes which assurance companies are charged with; the organization of mutual and proprietary assurance companies in countries where there are no special laws relating to assurance.

TENTH QUESTION.

New tendencies in the region of the ordinary and industrial life insurance.

The last years have brought with them a great deal of changes in the region of life and industrial insurance. It seems to be convenient and interesting to give a review of such changes, particularly for the industrial of the last five years, pointing out chiefly the following subjects: The rise of new organizations, their junction, and the formation of unions; new forms of insurance and new clauses of policies. In the cases when simultaneously with private life insurance companies public institutions are making ordinary or life industrial insurance, it would be desirable to have the description of the organization of such public insurance.

ELEVENTH QUESTION.

Moratorium.

In the event of heavy and widespread calamities such as are occasioned by war or by earthquake, the victims are sometimes authorized by their Government to postpone the dates of settlement of their financial obligations. It would be of interest to examine this question with a view to seeing in what way and to what extent the principles of this so-called doctrine of moratorium could be adopted and put into practice. This would involve a study of the history of the doctrine and of the advantages and benefits which could be derived by its application. It would also be necessary to define its scope and limitations in order that, after making due allowances for exceptional cases and circumstances, the proper interests both of creditors and of debtors could be protected. A point of special interest to the association would be the position and circumstances which might arise in such an event in connection with an obligation to pay a capital sum in cases where such a payment is due and is the chief condition of a contract, as, for example, in the case of a contract of insurance. Would it not be reasonable and equitable to allow the assurer some compensating benefit in return for the facility granted to the assured of postponing the date of payment of his premium and, if so, what form should such a compensation take? Is it not advisable that these questions should be considered, and certain principles defined and accepted, and that a basis of settlement should be agreed upon and made binding on all parties either by process of law or by mutual and general agreement? Is it not preferable to deal with these problems during times of peace when calm and disinterested judgment can be brought to bear on the subject? Lastly, is it desirable to prepare the various technical calculations which would be required as a guide or a basis for such a settlement? The object of the foregoing suggestions is merely to put forward for consideration this important question, which is capable of being dealt with and investigated either wholly or in part. Further, essays dealing with questions incidental to the main subject and having a bearing thereon would be acceptable.

MORTALITY AND REMARRIAGE TABLES FOR VALUING COMPENSATION TO WIDOWS AND OTHER DEPENDENTS

By Miles M. Dawson, Consulting Actuary

THE Workmen's Compensation Act of New York which went into effect on July 1, 1914, provided, as do most European acts, for pension to widow during widowhood, with two years' allowance upon remarriage; for a further pension to her for support of children under eighteen, with 50 per cent increase in case of her death; for pension to children, if no widow, until eighteen; for pension to others, if dependent, such as parents, or grandparents for life, or brothers, sisters or grandchildren until eighteen; all of this with a limit of two-thirds wages.

The New York Act also provides that the Commission may permit, or require, the present value of such to be paid into the State Fund, which thereupon becomes solely liable, the insurance company or employer being thereby completely released from such liability.

This rendered it necessary for the State Workmen's Compensation Commission to adopt a mortality table, a remarriage table and a rate of interest, to be used in computing such present values. This was also reasonably called for in order to set up paper reserves in the State Insurance Fund. Accordingly, on June 30, 1914, upon the recommendation of its actuaries and of myself, as consultant, the Commission adopted the following standards:

Mortality. The Danish State Insurance Fund (Statsanstalten) Survivorship Annuitants Table.

Remarriage. The Dutch State Insurance Fund (Rejksverzekeringsbank) Remarriage Table.

Interest. Three and one-half per cent per annum.

The Danish Survivorship Mortality Table was first introduced

by Mr. Christian Jensen, then of my staff, in Transactions A. S. A. Vol. X, p. 253; and an extension of it to minor annuitants in Transactions A. S. A. Vol. XI, p. 451.

Its availability was indicated by the fact that the compensation to be valued is a survivorship annuity, this being the only important table of that character. It was emphasized also by the further fact that this table was successfully graduated so as to follow Makeham's first law throughout, which greatly facilitates all the calculations, by permitting the use of equivalent equal ages, whether remarriage is involved or not, and also if minors, adults or both are involved.

The Dutch Remarriage Table is based upon the ten years' published experience of the Rejksverzekeringsbank of Amsterdam which administers the awarding and payment of all the compensation in Holland.

Its general applicability was tested, also, by comparison with certain British remarriage tables, some deduced from certain classes only and one from population experience.

This table was successfully regraduated under my direction by Mr. Edouard Olifiers, A. A. S., A. I. A., of my office staff, so as to be available for equivalent equal age calculations, combined with mortality as per the Danish Survivorship Table.

The resultant table giving the rates of remarriage and of death and the numbers out of a given radix remarrying at each age, the numbers dying unmarried at each age and the numbers surviving to the next age unmarried, is as follows:

Age.	Number Entering Unmarried. $l_x m+s$	Number Remarrying. m_x	Number Dying Unmarried. d_x	Remarriage Rate Per Annum. r_x	Death Rate Per Annum. q_x
20	88663	9467	473	.10678	.00533
21	78723	8192	423	.10407	.00537
22	70108	7088	378	.10110	.00539
23	62642	6133	338	.09790	.00540
24	56171	5303	306	.09446	.00544

65	10617	10611	6	947.85	13539.

The way in which these tables may be used is this:

They have been graduated by what is known as "Makeham's 1st Law," i. e. so that for calculating any joint-life annuity, lives of equal ages may be substituted—in the case of annuities terminated by death only, equal ages found by adding together c^x for each age (x), dividing by the number of lives and looking up an age corresponding (most nearly) with that value of c^x; and if terminable at the death or remarriage of the widow or the death of any one of several (m) others, by the formula:

$$c^w = \frac{c^{x+m} + c^y + c^y + - - - c^{y_m}}{m+c^n}$$

in which w is the desired equal age.

If the annuity is terminable at death only, the value may be computed by the Survivorship Annuitants' Table at the equivalent equal ages.

If the annuity is terminable at the death or remarriage of x or the death of y, y_2, y_3 - - - - or y_m, then two annuities are calculated at the equivalent equal ages, one by the Survivorship Annuitants' Table, which we will designate $a_{x\ y,\ y_2\ - - - -\ y_m}$ and another by the column $l_x^{(2)}$—called "the second series"—in the Combined Remarriage and Mortality Table; which we will designate as $a^{(2)}{}_{x\ y,\ y_2\ - - - -\ y_m}$. These two annuities are then added together in the following proportions:

$$a''_{x\,y,\,y_2\,\ldots\,y_m} = \frac{l_x^{(1)}}{l_{x^{m+s}}} a_{x\,y,\,y\,\ldots\,y_m} \frac{l_x^{(2)}}{l_{x^{m+s}}} a^{(2)}{}_{x\,y\,y_2\,\ldots\,y_m}$$

in which $l_x^{(1)}$, $l_x^{(2)}$ and $l_{x^{m+s}}$ are the values in the Combined Mortality and Remarriage Table, corresponding to the age x.

The great utility of these tables is in rendering complex problems of this nature readily soluble. These problems involve contingent or survivorship annuities. Such by a familiar actuarial process can be converted into a series of joint life annuities, which in turn can be readily computed at equal ages by these formulas.

FIRE INSURANCE IN GREAT BRITAIN, 1913-1914

A RECENT issue of "The Finance and Insurance Chonicle," of London, contains a survey of British fire insurance in the fiscal year 1913-1914. In attempting a comparison between these returns and the latest returns available for the United States, a number of perplexities at once present themselves, as, for instance, the lack of synchronism between the figures due to the fact that the English statistics are those of the running year, 1913-1914, and those for the United States are for the calendar year ended December 31, 1913. Then, again, the conditions under which fire underwriting is carried on in the two countries, are, of course, so different that any study of losses, expenses, commissions paid, and business written, etc., cannot possibly be an accurate guide to the comparative success or failure of the respective underwriters. It is interesting and valuable, however, to put some of the returns from the two countries side by side as a matter of contrast, perhaps, rather than comparison.

It appears, then, that net premiums written were, in 1913, $321,803,374 for 227 American stock and mutual companies (including United States branches of foreign companies), or an average of $1,417,737 per company. This compares with net premiums written by seventy British companies reporting in 1913-1914 of $147,092,992, or an average of $2,101,328 per company. Net losses paid by American companies for the year were $167,744,202, being an average of $748,212 per company, as compared with net losses of British companies of $74,805,810, an average per company of $1,068,654. Thus the average loss ratio of American companies was 52.77 per cent, as against a ratio of 51.56 per cent for British companies. Total commissions and expenses, less dividends and losses on ledger assets, were for American companies, $148,077,115, making a ratio of expenses to premiums of 46.01 per cent. The same figure for the British companies was $52,921,944, being a ratio of expenses to premiums of 36.47 per cent. It is interesting to note that for the American companies the ratio of commissions to premiums was 22.83 per cent, 23.18 per cent of premiums being absorbed by other expenses such as salaries, taxes, etc., while for the British companies the ratio of commissions to premiums was 15.92 per cent, 20.55 per cent being absorbed by other expenses.

After this brief outline of the fire insurance situation in the two countries, it is of interest to examine the complete figures for Great Britain. We give below the survey of the British fire insurance year, 1913-1914, as published in "The Finance and Insurance Chronicle.."

* * *

Readers will find in another part of the current issue of the "Finance and Insurance Chronicle" our customary annual tabulated returns of fire insurance business transacted by British offices, both tariff and non-tariff, during the past year.* In view of the changes which have taken place since our last table was published, exceptional interest attaches to the present statistics, which, we have reason to know, are looked for annually by those who follow the course of events in the insurance world in both hemispheres. So far as conflagrations themselves are concerned, the year proved to be more or less of a humdrum character, and as nothing of an exceptional nature transpired to upset the calculations of underwriters, their experience has been, upon the whole, of a satisfactory nature. The changes referred to have resulted in the disappearance from our list of the tariff offices of the "King" and the "Liverpool Victoria," and from the non-tariff section of the "Anglo-Scottish," the "National General," the "Northern Equitable," and the "Property." It will be seen, however, that their places have been taken by a larger number of other offices, thereby increasing the total number dealt with. Our last return for 1912-1913 embraced sixty-five offices (thirty-nine tariff and twenty-six non-tariff). The Chart now published comprises seventy, of which forty-three are tariff and twenty-seven non-tariff. So that while half-a-dozen were eliminated from the previous table, eleven fresh companies have been substituted and the usefulness of the table proportionately enhanced. The vast volume of business to which these figures are an index once more affords abundant testimony to the firm hold which fire insurance has upon the body politic of this realm and of its ever-increasing popularity. Once more our Chart sets forth that the aggregate premium income has reached a figure never before recorded and is indicative of the zeal and energy still displayed by all engaged in this competitive sphere of perennial activities. It will be found that while the thirty-seven out of the thirty-nine tariff offices retained in the current list were credited in the previous year with having received net premiums amounting to £27,305,838, they had since increased their total to £28,091,137, while the aggregate of the forty-three companies totals the equally impressive sum of £28,653,883. During the same period the net premiums of the twenty-two non-tariff offices still appearing in the list increased their total net premium revenue from £954,526 to £1,150,305, the additional five concerns aggregating £70,296, and making the total for the twenty-seven non-tariff companies £1,200,601.

As shown by the table given below, the net result of the year's trading was a surplus of £3,573,053, which is equivalent to 11.97 per cent of the premiums received during that period, a decline on the year of .53 per cent, following a sharp rise for the previous period of 3.06 per cent. There was at the same time a considerable decline in the sum disbursed in dividends, bonuses to assured, superannuation, amounts transferred to other accounts, etc., the total this time being £3,423,521, compared with the preceding figure of £3,938,038. As £1,496,383 had been received as interest, etc. (last year £1,451,072), nearly the whole of this sum had been added to the accumulated funds.

While the loss ratio on the whole indicated a slight upward tendency, there was again a substantial increase in the aggregate expenses of management of the thirty-nine identical tariff offices, which show an increase from £5,612,570 to £5,753,485, those of the twenty-two non-tariff companies being approximately the same. The net losses of the whole seventy companies amounted to £15,392,142, or 51.56 per cent of the premium revenue, as compared with the previous ratio of 50.87 of sixty-five offices. Last year's tariff offices loss ratio worked out at 51.38 per cent of their year's premium income, while the non-tariff offices corresponding figure is 55.57 per cent, the previous year's figures being 53.64 per cent and 53.93 per cent, respectively. The ratio of the commission and expenses of management for the seventy offices show 36.47 per

*Since the tabulation by companies is, perhaps, of less interest to American than to English readers, there are printed here merely the totals for all companies in sum.

cent as compared with 36.62 per cent for the previous sixty-five offices. The losses and expenses together represent 88.03 per cent of the premiums for the year, as against 87.49 per cent in the preceding year.

The following table will enable an approximate comparison to be made of the year under review with the records of the past decade:

Year.	Net Premiums.	Losses.		Commission Expenses.		Surplus (—) Deficit.	
	£	£	%	£	%	£	%
1903-04.....	22,015,784	10,857,022	49.31	7,667,493	34.82	3,490,269	15.87
1904-05.....	23,049,409	13,657,438	59.32	7,879,572	34.21	1,512,399	6.47
1905-06.....	23,165,397	10,815,935	46.69	8,111,767	35.01	4,020,695	18.30
1906-07.....	23,840,339	21,195,256	88.91	8,226,071	34.50	5,580,988—	23.41
1907-08.....	25,245,612	12,259,799	48.55	8,794,745	34.83	4,196,068	16.62
1908-09.....	25,053,445	13,285,065	53.03	8,928,783	35.64	2,836,597	11.34
1909-10.....	26,320,936	12,720,762	48.32	9,488,753	36.05	4,101,421	15.63
1910-11.....	27,346,227	12,940,338	47.32	9,910,827	36.24	4,495,062	16.44
1911-12.....	28,008,776	15,106,240	53.93	10,260,235	36.63	2,642,301	9.44
1912-13.....	28,520,225	14,507,303	50.87	10,446,344	36.63	3,566,578	12.50
1913-14.....	29,854,484	15,392,142	51.56	10,889,289	36.47	3,573,053	11.97

With regard to the surplus, it will be observed that, although the percentage was somewhat below that of last year, it was very much better than that for 1911-12. With the highest point of 18.30 reached in 1905-6 and the lowest of 9.44 in the year before last, the period under notice gives the happy mean of 13.45 per cent.

The total revenue for the year of the seventy offices appearing in our Chart, inclusive of interest earnings, was £31,350,867, as compared with £29,971,297 of the previously tabulated sixty-five companies. The total amount of reserves at the end of the year was £57,415,355. Including the paid-up capital the funds available for the security of policyholders was the colossal total of £70,-605,662, showing a much larger ratio to premium reserve of liability than ever before.

The subjoined table enables the reader to make a comparison of the latter series of figures with corresponding items in the two preceding years:

	Year 1913-14 (70 C'panies).	Year 1912-13 (65 C'panies).	Year 1911-12 (67 C'panies).
Funds at beginning of the year, excluding capital	£51,968,971	£39,159,820	£38,542,743
Net premiums received	29,854,484	28,520,225	28,008,776
Interest, etc., less income tax, debts, etc.	1,496,383	1,451,072	1,653,147
Net losses	£15,392,142	£14,507,303	£15,106,240
Commission	4,755,100	4,499,538	4,485,388
Expenses	6,134,189	5,946,806	5,775,147
Dividends or bonuses to policy-holders, etc.	3,423,521	3,938,035	2,768,420
Funds at the end of the year, excluding capital	57,190,524	41,785,584	40,032,114
Standard of safe reserve	£14,859,118	£14,250,834	£14,004,284

Capital paid up.....	13,190,307	11,826,406	11,598,950

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Proposed Mutualization of the Metropolitan Life Insurance Company.—Following the lead of its great competitor, the Prudential, the officers and directors of the Metropolitan Life Insurance Company, under date of November 18, have issued a circular letter presenting to the policyholders insured for one thousand dollars or more and whose insurance has been in force at least a year a plan for the mutualization of the company. The company is a stock company operating under a special charter. Most of the policies are non-participating. The capital of the company is two millions of dollars, divided into eighty thousand shares of twenty-five dollars each, and the dividends to the shareholders are limited to seven per cent per annum. The charter of the company provides that the net surplus derived from the business of the industrial department shall be added to the capital stock as additional security to the policyholders.

The laws of New York make provision for the mutualization of stock insurance companies under a plan for the acquisition by the company of its capital stock which shall be approved first by a majority of the directors; second, by a majority of the capital stock at a meeting of the stockholders called for the purpose; third, by a majority vote at a meeting called for the purpose of policyholders each insured in at least one thousand dollars and whose insurance shall then be in force and shall have been in force for at least one year prior to such meeting, and, fourth, by the Superintendent of Insurance.

The plan presented has been unanimously approved by the directors. It is to be submitted to the stockholders at a meeting to be held on December 4, 1914. The meeting of policyholders to vote upon the plan is called for December 28, 1914. The holders of practically all the capital stock have expressed their approval of the plan.

The plan provides for the acquisition of the capital stock at the price of seventy-five dollars per share. Its adoption will call for the return to the stockholders of two millions of dollars, the share capital, from the assets of the company, and four millions of dollars from its surplus. The total surplus at the end of September, 1914, was estimated at over forty millions of dollars. The details of the plan, as submitted, are as follows:

* * *

PLAN

For the acquisition of the shares of the capital stock of the Metropolitan Life Insurance Company, pursuant to Section 95 of the Insurance Law of the State of New York, to the end that the company may become a mutual life insurance corporation.

I.

The company to pay the sum of $75 for each share of the outstanding eighty thousand shares of its capital stock in cash.

Such payment to be made on the 5th day of January, in the year 1915, provided that at that time this plan has been approved—(1) by a vote of the stockholders of the company representing a majority of the capital stock at a meeting of stockholders called for the purpose; (2) by a majority vote at a meeting called for the purpose in the manner hereinafter provided in this plan of the policyholders of the company each insured in at least one thousand dollars, and whose insurance shall then be in force and shall have been in force for at least one year prior to such meeting; and (3) by the Superintendent of Insurance in writing; and if it has not been so approved on or before the 5th day of January, 1915, then such payment is to be made within ten days after the last of such approvals shall have been given.

Such payment to be made by the deposit of the sum of six millions of dollars with the New York Trust Company at its office, No. 24 Broad Street, in the City of New York, for and on behalf of the owners of the shares of the capital stock of the company at the time of such deposit. On the surrender and delivery by a stockholder to said Trust Company of his shares properly endorsed in blank he is to receive from the Trust Company out of the sum so deposited the sum of seventy-five dollars for each share so surrendered.

As shares of the capital stock of the company are surrendered and deliverd to the New York Trust Company under this plan and payment therefor is made it is to deliver the same to the Metropolitan Life Insurance Company.

II.

The sum of six millions of dollars to be appropriated out of the

surplus of the Metropolitan Life Insurance Company for the acquisition by it of all of its capital stock as herein provided.

III.

This plan to be submitted to the stockholders of the company at a special meeting called for that purpose, to be held on the 4th day of December, 1914, at eleven o'clock in the forenoon at the offices of the company, No. 1 Madison Avenue, New York City. Fourteen days' notice in writing of the time of such meeting to be given by mail to each registered stockholder at his address as the same appears on the books of the company at the date of the mailing of such notice, which notice is to be accompanied by a copy of this plan. Each stockholder to be entitled to one vote for each share of stock owned by him, and to vote in person or by proxy. The result of the votes cast at such meeting to be certified by the secretary of the company to the Superintendent of Insurance.

IV.

This plan to be submitted at a meeting called for the purpose of policyholders of the company, each insured in at least one thousand dollars, and whose insurance shall then be in force and shall have been in force for at least one year prior to such meeting; to be held at the offices of the company, No. 1 Madison Avenue, in the City of New York, on the 28th day of December, 1914, at eleven o'clock in the forenoon. Notice in writing of the meeting to be given to each of such policyholders appearing as such on the books of the company on the 26th day of November, 1914, by mailing the same to him at his address shown by the said books at that date on or before the 27th day of November, 1914, which notice shall be accompanied by a copy of this plan. Each of such policyholders to have one vote, and to vote either in person or by proxy. Two forms of proxy to be sent to each of such policyholders with the notice of the meeting, one headed "Proxy for the plan," and designating John H. Hallock and John W. Herbert, as the attorneys and agents of the policyholder to vote for him in his name, place and stead in favor of the plan; the other headed "Proxy against the plan," and designating Edgar A. Treadwell and Edwin A. Stevens as the attorneys and agents of the policyholder to vote for him in his name, place and stead against the plan. A proxy to be effective must be filed with the secretary of the company at least five days before the meeting to afford an opportunity for tabulation and verification in advance of the meeting. The votes cast at said meeting to be canvassed by three inspectors to be appointed by the Superintendent of Insurance, who shall certify the result in duplicate to the company and the Superintendent of Insurance.

V.

This plan to be submitted to the Superintendent of Insurance of the State of New York for his approval in writing.

VI.

Upon the deposit by the Metropolitan Life Insurance Company with the New York Trust Company of the sum of six millions of dollars, as hereinbefore provided, for the acquisition by the company of all of its capital stock, and after written notice of the approval of said plan shall have been mailed to all the stockholders and policyholders who were entitled to vote on said plan at their respective addresses as then shown by the books of the company, the said corporation is to become a mutual life insurance corporation under the provisions of its charter applicable to it as such or as said charter shall be amended for that purpose pursuant to the provisions of the Insurance Law of the State of New York. Thereupon the procedure provided by Section 52 of the Insurance Law to be followed to conform the charter to the status of the company as a mutual life insurance corporation or to adopt in whole or in part a new charter in conformity with said section.

The Grain Dust Explosion Hazard.—In co-operation with the Bureau of Mines of the Department of the Interior, the Bureau of Chemistry of the Department of Agriculture, at Washington, is now making a study of the explosibility of grain and other forms of carbonaceous dusts, except coal dust, which is being investigated by the former Bureau. The study was begun largely as the result of an explosion in a feed-grinding plant at Buffalo, N. Y., in 1913. In this accident thirty-three men were killed, and more than seventy injured. Such explosions are, unfortunately, too common, but it is probable that when no loss of life occurs nothing is heard of a great number of minor occurrences. In the past year scientists have carefully investigated and studied sixteen which have taken place since 1905. Of these four took place in cereal mills, three in grain elevators, two in feed mills, three in starch factories, one in a glucose factory, and three in flour mills. At least eighty men were killed in these explosions, and 122 injured. The total property loss exceeded $2,000,000. Since 1911, four similar explosions are known to have occurred in Europe, two in dextrin works, one in a provender mill grinding peas, beans and wheat, and one in a linseed mill. Fifty persons were killed and 119 injured in these disasters. Such figures as these are quite sufficient to demonstrate that coal dust is not the only dangerous form of carbonaceous dust. The object of the scientific study now in progress is to discover some way of preventing the frequent accidents in grain mills, elevators and industrial plants throughout the country.

Insurance in Japan in 1913.—From a report on insurance in Japan in 1913, by Mr. E. F. Crowe, commercial attaché to the British Embassy at Tokio, recently printed in the "Eastern Underwriters," New York, we take the following:

"The year 1913 showed, on the whole, very unfavorable results for all fire insurance companies operating in this field—Japanese and British offices alike—owing to the ever-increasing scramble for business and to the rates of premium being forced down to a very low level; in fact, rates now current for nearly all classes of risks are considered by most fire underwriters to be on a non-paying basis. But in Japan, where fire insurance is only a development of the last twenty years, the principles of insurance are but very imperfectly understood by the bulk of the nation, and it will take many years yet before fire insurance becomes at all general and the necessity for insurance cover full realized; it is consequently difficult at times for companies operating in this country to work together. Losses during the year have been exceptionally heavy—about double those of an ordinary average year—caused principally by the many serious conflagrations throughout the country, the most notable among which was the fire in February in the Kanda district of Tokio, when 2,598 houses were reported as destroyed, involving the insurance companies in a loss of £300,000. Although the usual annual figures published by the Department of Agriculture and Commerce are not yet available for the year 1913, it is estimated that the total losses paid for the whole of Japan by both Japanese and British companies will approximate £800,000 for the year against an estimated premium income of £1,000,000; in addition, expenses averaging 30 per cent for the Japanese offices will have to be provided for out of this premium income account. From this it will be seen that 1913 has been a disappointing year for those interested in fire insurance in this country.

"Owing to the favorable results obtained by the older established Japanese companies in the years 1910-11, a small boom took place in insurance business in 1912, and many new small Japanese

FINANCIAL AND COMMERCIAL REVIEW

QUITE a flush of optimism spread over finance and business in the first half of the week now ended, although the tones of sentiment were of a more sober hue as the week drew to a close. So many things had happened lately which were of encouraging import, so much had been done to readjust conditions to the circumstances of the war and restore banking and business machinery and increase facilities for accommodating strain that Wall Street grew almost buoyant. Reports that leading stocks and a considerable number of bonds were selling at or above the closing level of prices on July 30, stimulated efforts to start the experiment of a partial reopening of the Stock Exchange for dealings in investment issues strictly. The fact that current quotations are ex-foreign transactions and have not been subjected to the tests of an open and unrestricted market suggested caution, but by Thursday morning the Wall Street community was quite convinced that within a few days general dealings on the Stock Exchange would be resumed after a beginning had been made with the bond department, although of course under certain safeguards.

It appeared, however, that anticipation was a little too keen. By Thursday night the information was circulated that certain difficulties had arisen which stood in the way of carrying out the expansive programme of a relatively unlimited resumption of the securities market and Wall Street was left to infer that the difficulties probably denoted convincing evidence that selling orders in large quantity were only awaiting execution at a favorable opportunity to be presented by the restoration of the regular market facilities.

Too much attention should not be paid to the arguments which will tend to limit foreign liquidation; this will undoubtedly be heavy, although it will also undoubtedly be gradual. It will be very much to our advantage to recover possession of these securities to the largest possible extent, as the transfer back to us will take place at a bargain level of prices. It is proper to recognize that Europe's necessity means American opportunity. Nor is the effect of liquidating sales, foreign or domestic, on the price level of securities altogether material. The range of values must be lower for years to come in comparison with the past. This is a fact which has to be faced, but when the Stock Exchange closed values were already quoted too low for their permanent worth. There is a vast buying power in this country to absorb offerings of stocks and bonds and the capacity for absorption is a guaranty against any prolonged further decline. In any event the total of compulsory liquidation is more likely to be increased than diminished by the protracted denial of facilities for liquidation so that the matter of prices can be practically eliminated from the reckoning of the Stock Exchange problem.

There remains only the threat that foreign liquidation will deplete our gold supply excessively, and the resourcefulness of the banking world ought to be equal to framing some arrangement which will meet this particular difficulty. American bankers and business men have been displaying a great deal of ability in the last three months to get together in agreements and through concerted action take steps which have been very helpful in disposing of one critical difficulty after another. We fancy that the Federal Reserve Banks furnish to-day the medium through which the country's gold supply can be satisfactorily protected by enlisting the co-operation of the entire banking community of the country in an engagement to allow the export of gold to be regulated by the Federal Reserve Board, a body which will be recognized by any foreign banking power.

The opening of the Federal Reserve Banks on Monday was justly regarded all over the country as a large contribution to the country's equipment of facilities for coping with the present financial emergency. After the first preliminary flourish of trumpets the process of preparing the new banks to do business was conducted quietly and smoothly and indications have been afforded that our modernized financial machinery will be carefully handled to avoid mistakes. The official rates for discounting were fixed high enough to guard against any initial abuse of the increased credit capacity, but a word of warning is in order with regard to the new banking system. The Federal Reserve Board is going to be taxed to the utmost to resist pressure at Washington to make it a mere branch of the Treasury; and President Wilson, as well as Secretary McAdoo, perhaps look upon the Federal Reserve Banking System too much as an administrative sub-division.

So far as concerns the Treasury attitude it is difficult to have patience with the disposition of banking interests to comply with Treasury aggressions in the banking field instead of opposing them. Nothing can be more infallibly destructive of the banking reform which has been inaugurated than to have the Federal Reserve System become in effect a Government bank, because it is treated as such by the Treasury, and because banking opinion refuses to antagonize political authority. Our whole history is a reminder of what is certain to occur to anything resembling a Government bank in the United States, and very recent history, the history of the last few days in fact, denotes that the danger of a Government bank is not so remote.

Although the Federal Reserve Board is prohibited by the very law which creates it from doing anything of the kind, it has been induced by Mr. McAdoo to take charge of the ambitious cotton loan fund. In other words the Treasury has annexed the Federal Reserve Board and made it party to the political considerations which dictated the cotton pool project and kept Mr. McAdoo working upon it until he had achieved the superficial success of a banking subscription for the $100,000,000 of class A certificates proposed. It makes an unfortunate impression to have the Board at the very outset of its career associated with any such ill-conceived scheme and the impression is made worse by reflecting upon the Board's surrender to Treasury pressure.

With the reopening of the cotton exchanges an important part of the country's economic machinery was restored to working order. The restoration of the future market for cotton puts the country very much where it was in respect to business and financial facilities on the outbreak of the war with the sole conspicuous exception of the stock exchanges. The suspension of the stock exchanges may have to be continued more or less indefinitely, but there is cause for gratification in the reopening of the cotton exchanges. It will conduce to an easing of the banking position, to the relief of economic distress in the South and to the benefit of

the country generally and to other countries through the larger international movement of the staple which must result from the operations of the contract market.

Furthermore, accessibility to future dealings removes the last vestige of business excuse for the McAdoo cotton pool and leaves it with nothing but a political argument. Perhaps the pool will prevent any very serious agitation, at the next session of Congress, for Government valorization or Government bounties to the cotton grower, but there is an excellent prospect that the politics of the scheme will be frustrated. It is more than doubtful if the Southern banker will ever go to the trouble to start the process of loaning through the fund and it is not going to take very long for the numerous statesmen who have been demanding governmental largesse for the South to see the ineffectiveness of Treasury strategy. Incidentally it might be remarked that the essential viciousness of the cotton pool is shown in the fact that if it ever does operate it will push emergency currency into circulation when it ought to be retired.

Foreign trade figures continue to make an encouraging exhibit. The October export balance, while less than last year's for the corresponding month, was in excess of $50,000,000, and returns for the first half of November suggest that this month's balance may amount to $75,000,000. Foreign exchange reflects the progressive recovery of our export trade, although there has been no particular deviation in rates this week. The domestic money market might be quoted as on a 5 per cent basis, but the attention of business men might profitably be directed to the market which is growing up for bankers' acceptances of commercial bills. These are quoted at 4 to 4½ per cent, as compared with 5½ to 6 per cent level of ordinary commercial paper.

The principal aspect of foreign news worth remarking upon was the sombre suggestion of the fearful costs of war conveyed by British financing. Great Britain has done remarkably well to be able to float $1,750,000,000 worth of obligations on what is practically a 4 per cent basis, but there are depressing implications in the estimates of the Chancellor of the Exchequer that the war will cost Great Britain $2,250,000,000 a year for two years, if it lasts that long.

London	22⅛	22⅛	23¼	22 15-16	22⅞	22¾

COTTON

November 21, 1914.

THE week has been a notable one for the cotton trade by reason of the fact that the three great cotton exchanges of the world,—New York, New Orleans and Liverpool,—have been re-opened for unrestricted business, after a cessation of activities lasting for sixteen weeks, and that, too, during the period of the heaviest movement of the American cotton crop. There is no denying that there were grave anxieties on the part of the more experienced and thoughtful members of the exchanges, as the day approached when the markets must undergo the test of free trading in cotton for the account of the entire world. It was known, of course, not only that the supply of unsold American cotton of the new crop was far the largest in recorded history, but also that large quantities of cotton and of commitments in cotton had been perforce carried over with ruinous losses from the desperate days of the end of July and of early August which saw the entire commerce of the world disrupted at a stroke by the outbreak of the European War. So long as the Exchanges had remained closed, those unfortunately caught in the cruel predicament had found no opportunity to rid themselves completely of their crushing load. What would they do when they should have free access to open markets? And what would a multitude of holders of cotton throughout the South do, when it should be possible for them to find buyers for their cotton at some price, even though a disastrously low one? And, again, would there prove to be enough buyers,—spinners or merchants or speculators,—to absorb even a moderate amount of necessitous selling? Or would prices yield so rapidly under such selling as to send a panic terror through the minds of all holders of cotton everywhere? These were the questions which serious members of the trade were asking themselves before the exchanges opened on Monday morning last. Fortunately, the anxiety was not justified by the event; yet, all the same, it was a natural and even prudent anxiety. As it was, all the great futures markets opened quietly and naturally, and their course throughout the week has been quiet and natural. Despite the unprecedented supply of unsold cotton in the South, despite the inevitable offerings of cotton unwillingly carried over from July, despite the subtraction from the body of possible buyers of three-fourths of the cotton merchants and manufacturers of Europe, despite the industrial and financial embarrassments of the unsettled war, the price of future contracts for cotton in New York ruled on Monday a full cent per pound higher than the lowest prices touched during the crop season of 1904-1905 and only a cent per pound lower than the lowest prices touched during the season 1911-1912. It may be said that those were both seasons when record crops were produced and when low prices followed as a natural consequence of supply outstripping consumptive demand for the time being. But the present crop also bids fair to surpass all previous records and might be expected, irrespective of the war, to sell much lower than either of the last two crops Indeed, most persons in the trade would last Spring have predicted, if they could have foreseen a production this year of 16,000,000 bales or more, that the price of cotton would certainly decline at least as low as it went in 1911-1912, i. e. to a little above 8¼ cents per pound. Hence it should have ranged from somewhat below to somewhat above 7½ cents; and it is perhaps still more remarkable that the decline of the succeeding days, when little by little the "distress" cotton in the South and in the North and indeed to no small extent in England and on the Continent was reached and offered for sale, should have been limited to not much more than one-half cent per pound. At the end of the first five days of the new trading, the price of cotton in New York was still more than two cents per pound higher than the prices touched in 1897-1898 and 1898-1899; it was more than one-half cent per pound higher than the prices of December, 1904, and January, 1905; and it was but a trifle more than one cent per pound lower than the prices of December, 1911. Certainly no more illuminating illustration could possibly be given of the growth in recent years of assured economic knowledge about cotton than that under the present conditions such a level of prices could be maintained for the week succeeding a long period of intermission of old consecutive trading, made necessary by the world-wide effects of the most destructive war in history. Of course, the truth is that this result was made possible primarily by the resolution and self-sacrifice with which the members of the cotton trade, in their capacity as members of the cotton exchanges, have dealt with the problems of loss and distress, and, (it must be added), to no small extent, of impropriety, which the cataclysm of July left behind it. Courage of the highest order and the most experienced business acument have been required for the task; and these have been unstintingly contributed by the masters of the cotton trade for the benefit of all. And so the great cotton markets are open again without confusion, without lingering apprehensions of trouble to come, with the same opportunities as of old for the buyers and the sellers of cotton to meet and to enter into their customary transactions, one with the other. The price of cotton in these markets is still, in the opinion of those whose price convictions are based upon economic fact, too low to be permanent; but it cannot be said of this price that it is inordinately low in comparison with the prices of but a few years ago, when universal peace reigned and the prodigious economic progress of the world was at full stride. Naturally, the cotton producers cannot be contented with these prices below the cost of production; but at least they are faring quite as well as other producers of other commodities, in this and other countries.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	485,136	515,493	446,126	369,815
Overland to mills and Canada	43,399	48,533	48,366	41,447
So. mill takings, est., exclusive of takings from Southern ports.	100,000	100,000	105,000	80,000
Gain of stocks at interior towns	43,447	52,794	63,372	67,271
Brought into sight for week	671,982	716,820	662,864	558,353
Total Movement—				
Port receipts	5,222,795	5,228,097	5,183,033	2,389,353
Overland to mills and Canada	254,361	257,569	331,439	227,605
Southern mill takings	932,032	905,873	949,796	582,887
Stocks at interior towns in excess of Sept. 1	639,034	498,289	509,269	868,887
Brought into sight thus far this season	7,048,222	6,889,828	6,973,537	4,068,714

The total crop movement is respectively for 116 days, 114 days, 113 days and 112 days.

CENSUS BUREAU REPORT ON CONSUMPTION AND DISTRIBUTION OF COTTON IN OCTOBER.

On Saturday, November 14, the United States Census Bureau issued its monthly cotton supply report, giving the consumption, distribution and supply of cotton in the United States for October, 1914. The figures, with comparisons for October, 1913, are given in the following tables,—round bales being counted as half-bales and bales imported from foreign countries being reduced to equivalent 500-pound bales (net weight):

CONSUMPTION AND ACTIVE SPINDLES IN OCTOBER.

	Consumption		Active Spindles	
	1913, Bales.	1914, Bales.	1913, No.	1914, No.
In mills in the Cotton State.	263,235	241,071	12,080,706	12,325,054
In mills in all other States	248,688	210,770	18,774,654	18,326,892
Totals for United States	511,923	*451,841	30,855,360	30,651,946

*Includes 15,526 bales of foreign cotton.

STOCKS OF COTTON IN MILLS AND IN WAREHOUSES ON OCT. 31.

	In Manufacturers' Establishments		In Independent Warehouses	
	1913, Bales.	1914, Bales.	1913, Bales.	1914, Bales.
In the Cotton States	564,393	332,464	2,460,875	3,675,197
In all other States	458,622	380,943	48,783	104,839
Totals for United States	1,023,015	†713,407	2,509,658	‡3,780,036

†Includes 52,545 bales of foreign cotton.
‡Includes 9,384 bales of foreign cotton.

Figures for the consumption of cotton in the United States for the three months ended October 31, 1914, with comparisons for the same period in 1913, are as follows:

CONSUMPTION OF COTTON IN THE UNITED STATES FOR THREE MONTHS ENDED OCTOBER 31.

	1913, Bales.	1914, Bales.
In mills in the Cotton States	734,971	669,150
In mills in all other States	651,737	581,565
Totals for United States	1,386,708	1,250,715

Linters, not included above, were 29,101 bales consumed in October, 1914 (vs. 31,355 bales in October, 1913). Stocks of linters on October 31, 1914, were 65,262 bales in manufacturers' establish-

Cotton Situation in Austria-Hungary.—A sidelight upon the cotton supply situation in Austria-Hungary is shed by a piece of war news, recently received in New York, of the most pathetic and moving character. The New York "Evening Sun," of November 18, published a letter from Vienna, dated October 17, sent by William G. Shepherd, staff correspondent of the United Press. The theme of the letter was an appeal to Americans to make use of the parcels post to send to the Red Cross at Vienna packages of absorbent cotton for use in dressing wounds. The account given of the utter dearth of cotton in Austria and of the bitter suffering caused by the lack of it for the severely wounded illustrates poignantly the dependence of modern communities upon a supply of cotton. The following are extracts from the letter:

"For three weeks the hospitals here have been absolutely without cotton to dress the wounds of dying soldiers. The American Red Cross corps, which arrived yesterday, brought a small supply, which was immediately distributed among the hospitals and will last only a few days, even with the most careful use.

"Doctors and nurses are forced to use small bags of threads. Everybody in Vienna who can't help in any other way spends his or her spare time in unravelling small squares of cloth, cut from sheets and handkerchiefs. The short pieces of thread are sewed into bags of gauze, which are sterilized. The most delicate wounds must be dressed with this rough, harsh material.

"Americans, in the name of humanity, ought to send cotton to

Austria. No other country can help in this way. The greatest complaint in America is the oversupply of cotton. In Austria wounded men are dying in agony for lack of a few ounces of it. And soon it will be Christmastime throughout the world.

"By parcel post a vast quantity of absorbent cotton can be sent to Vienna if American citizens will take upon themselves the personal responsibility of each buying and mailing, at parcel post rates, a small box of cotton. If the package is addressed to the Red Cross, Vienna, and is marked "Watte für die Verwundete" (cotton for the wounded), it will reach the hospitals within three weeks from the time it is posted in America. It should easily reach there before Christmas.

"I have ascertained the exact situation in regard to the supply of cotton in hospitals. There is none. Even the supply of hospital gauze is giving out. Nurses are using only two-inch squares of gauze for cleaning purposes instead of the regulation gauze of handkerchief size. More gauze, it is believed, can be manufactured in Austria. But cotton for hospitals must be supplied from the outside world."

The Portuguese Government and the Cotton Situation.—According to Mr. W. L. Lowrie, United States Consul at Lisbon, in order to minimize as much as possible the crisis in the Portuguese cotton industry, the Government has issued a decree providing for its guarantee, up to the amount of 200,000 escudos (about $200,000), of the payment of notes of purchase and sale of raw cotton under certain conditions. A translation of the provisions of the decree follows:

Art. 1. The Government is authorized to guarantee by way of a surety, up to an amount of 200,000 escudos, the payment of notes of purchase and sale of raw cotton when said notes are drawn by the sellers and accepted by the buyers, manufacturers of thread and textiles.

Art. 2. The surety shall be written or given in the terms of article 305 of the Commercial Code, by the Ministro do Fomento, after hearing the commission created by decree No. 767 of August 17 last, to whom interested parties shall previously present, together with the notes, the invoices and other documents concerning the purchase and sale represented by said documents.

Art. 3. The surety shall be given only to those manufacturers who may prove, before the above-mentioned commission, that they need it to prevent the closing of the factories.

Art. 4. In order to guarantee the responsibility assumed by the Government in giving this surety, independently of the privilege granted under the terms of clause No. 1 of article 883 of the Civil Code, there shall be deposited, as a security, under the direction of the chief engineer of the technical services of the industry, in the general industrial warehouse that may be found in the area occupied by the factories, or, if there is none, in the one provided for by decree No. 865 of the 16th instant, the State retaining the privilege mentioned in article 886 of the Civil Code, one-third of the merchandise manufactured by the bailees, and while said bailees are liable to other interested parties on notes of their acceptance. The deposit, however, shall not be required when the acceptors of the notes covered by surety of the Government pay the corresponding amounts, or guarantee payment thereof before the commission referred to in article 2 by means of securities or bail of two responsible firms.

Art. 5. Any amounts that the Government may have to pay by virtue of the responsibility contracted in giving the surety shall be paid from the item referred to in decree No. 768 of August 17 last.

[The estimated number of cotton spindles in Portugal is 482,000.]

BOOK REVIEWS

Cotton Facts,—Edition of October, 1914.—The first of the 1914 editions of the invaluable statistical hand-book of cotton, "Cotton Facts," originally compiled by the late Alfred B. Shepperson, and now edited by the well-known statistician, Mr. Carl Geller, has just been issued by the Shepperson Publishing Company, New York. The new volume contains all the familiar information regarding the production, distribution, consumption and supply of cotton, whether of American or of other growths, despite the fact that the European War, through its interruption of the usual statistical information from the Continent of Europe, has imposed heavy labor upon the editor in the obtaining of complete figures for the season of 1913-1914. Moreover, new features of great interest to the cotton trade, have been introduced,—the most important perhaps being statistics of temperatures and rainfall in the Cotton Belt of the United States, for the past five years for temperatures and for the past ten years for rainfall. A convenient telegraphic code for reporting weather conditions is added. The entire volume is compact with information and is indispensable to the thinking cotton merchant or spinner.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

(Continued from Page 660.)

companies were started, but as most of these recently-established companies have been losing money steadily since their inception, the fever has subsided, and only one new Japanese fire company of any importance was established during 1913; this company commenced business in the Summer, and they have not yet published their first annual report (the Chiyoda Fire).

"During the year under review the Japanese offices again attempted to come to some arrangement among themselves for a tariff of rates on all business other than industrial establishments, but although many conferences were held, no definite conclusion was arrived at. Negotiations, however, are still proceeding.

"In 1913 one of the leading Japanese companies approached the British offices in London with a proposal for the formation of a joint association of British and Japanese insurance offices for the adoption of a uniform tariff of rates on industrial establishment throughout the Japanese Empire; the proposal was, on the whole, favorably received, and it is expected that negotiations between representatives in Japan of the Japanese and British offices will be opened in the very near future; arrangements for joint meetings are now being made, and it is hoped a working agreement satisfactory to both sides will finally be reached during the course of this year (1914). * * *

"New laws affecting foreign insurance companies became effective this year.

"As far as life insurance is concerned, these ordinances required almost the complete revolutionizing of the methods of conducting business by such companies as elected to comply with the same.

"The ordinances made retroactive that provision which called for the depositing of Japanese approved securities to the amount of 60 per cent of the total reserve liability, the balance, or 40 per cent of the reserves, being allowed to cover loans made by policyholders against the reserve value of their policies. The combined deposits and loans, however, are in no case to exceed 100 per cent of the legal reserves. The deposits required by the foreign companies are limited to Japanese Imperial Government, municipal, and provincial bonds, South Manchurian Railway bonds and the debentures of two or three semi-governmental banks. Credit for full face value is allowed on Imperial issues, 90 per cent on face values of municipal and provisional issues and 80 per cent of market value on the remaining securities above mentioned.

"All policy contracts in future are to be printed in the Japanese language, unless otherwise requested, this latter concession being granted to meet the requirements of foreigners residing in Japan. The Japanese version is the legal text of the policy, and all policy contracts are subject to the law of Japan.

"The general provisions and policy privileges embodied in the contracts for assurance, issued by the companies heretofore, remain substantially the same; only certain modifications and changes effected to suit the local conditions and requirements.

"There are four foreign companies doing business in Japan who have complied with the provisions of this new ordinance, viz., three British (two Canadian and one Hong Kong) and one American company.

"The latest available figures, furnished by the Japanese Insurance Department, show that at the end of 1911 the total amount of business credited to the foreign companies was £6,045,848,, calling for an annual premium income of £346,596, and a reserve liability of £1,227,300. The above figures, however, have been very materially augmented during the past three years.

"Since the active introduction of life assurance by the foreign companies, some twenty-four years ago, great progress has been made, although the percentage of lives assured is still very small in comparison with the assurable population. The total Japanese companies, of which there are now some thirty odd, are prosecuting the business very energetically and successfully, and are adopting every modern means of educating the masses of the people to the value of life assurance.

"From information gathered from the representatives of the foreign companies in Japan, prospects for the future seem very encouraging, although great care has to be exercised in the selection and acceptance of lives."

In this connection it is interesting to note that Mr. J. D. Whelpley, in his book, "The Trade of the World," says: "The most profitable businesses in Japan at the moment are cotton spinning, insurance, sugar refining and banking."

* * *

Insurance in Switzerland in 1912.—In the issue of this paper for October 31, there appeared a review of life insurance in Switzerland in 1912. We give below a brief outline of the other forms of insurance transacted in that country in the same year:

Fire Insurance.—The fire premiums received in 1912 and the losses paid by foreign companies in Switzerland alone were 4,196,-032 francs and 2,425,466 francs, respectively. Seven German, 11 French, 1 Italian and 2 British companies participated in this business. Swiss companies, of which there were five, reveived 9,509,953 francs in premiums on property in Switzerland and 13,-624,003 francs from risk underwritten in foreign countries in 1912. Losses on Swiss underwriting amounted to 5,627,729 francs. There were also twenty organizations called "Etablissements cantonaux." The latter are managed by the officials of the Cantons. Eighteen of these organizations insured only immovable property, receiving 9,691,502 francs in premiums and paying 5,235,174 francs in losses. The remaining two insured movable property, their premiums and losses being 747,977 francs and 262,950 francs, respectively. It is reported that in 1912 as much as 36.8 per cent of the amounts insured by these organizations was reinsured, as compared with 23.3 in 1909.

Accident Insurance.—The accident insurance premiums received in 1912 and the claims paid by foreign companies in Switzerland were, respectively, 3,258,686 francs and 2,207,698 francs. Seven German, 4 French, 1 Italian and 1 British company shared the business. The figures for Swiss companies in respect to home business were 24,192,851 francs and 15,679,440 francs, respectively. The Swiss companies also received accident gross premiums amounting to the large sum of 58,441,983 francs in respect of business abroad. Ten mutual trade societies which are not subject to the supervision of the State Insurance Department received accident premiums amounting to 1,601,283 francs.

Plate Glass Insurance.—Two Swiss, 1 French and 11 German companies who issue plate glass and other glass insurance received premiums for Swiss risks amounting to 476,296 francs and the losses totaled 208,763 francs. Foreign business added 45,313 francs to the gross premium incomes of the Swiss companies.

Insurance Against Damage by Water.—Premiums amounting to 176,471 francs were received by 3 Swiss, 1 French and 6 German companies for insurance against damage by water. The claims amounted to 38,519 francs. In addition, the Swiss companies received from risks abroad 9,475 francs in gross premiums.

Burglary and Fidelity Insurance.—Seven Swiss, 1 French, 1 British and 12 German companies received premiums amounting to

686,153 francs and the claims amounted to 296,813 francs. The Swiss companies also received as much as 1,695,197 francs from gross premiums of risks abroad.

Commercial Credit Insurance.—The Fédérale of Zurich is the only company which transacts commercial credit (debt) insurance. The premiums in 1912 amounted to 279,512 francs and the claims to 154,519 francs. The company commenced this class of business in 1909.

Live Stock Insurance.—One Swiss, 1 German and 1 French—all mutual societies—transacted live stock insurance in 1912, but the first two only insure horses, asses and mules. The three companies received in premiums 635,972 francs and the claims amounted to 482,214 francs.

Hail Insurance.—Two Swiss societies transact hail insurance. The premiums received in the year amounted to 1,393,590 francs and the claims to 654,625 francs. The results were much more satisfactory than those of the previous two years.

Transport Insurance—Twelve German, 1 Austrian, 1 British and 6 Swiss companies transacted transport insurance. The Swiss companies received in 1912 for Swiss risks 2,799,595 francs and the claims amounted to 1,859,919 francs. The gross premiums of their business abroad amounted in the year to the large sum of 21,743,-305 francs. The total premium incomes and claims of the foreign companies in respect of Swiss business were respectively 597,103 francs and 372,047 francs.

Reinsurance Companies.—Four Swiss companies transact exclusively reinsurance and co-assurance business.

INSURANCE NEWS IN THE WEST

Potts Anti-Trust Suit May Be Dismissed.—It has become pretty well understood in Chicago inner circles that all the suits between the companies and Insurance Superintendent Potts will probably be dismissed. The story goes that representations have been made to Governor Dunne which caused him to do some investigating on his own account with the result that he became convinced that the anti-trust suits and also those against the companies operating annexes were based upon insufficient grounds. Of course, if these suits were dropped the companies would drop their suit in Federal Court to enjoin the Superintendent from proceeding in the State courts against certain companies operating annexes.

* * *

The Chicago Board of Underwriters Rejects Coughlin.—The executive committee of the Chicago Board of Underwriters has rejected the application for membership of John J. Coughlin, Cook County manager of the Columbian of Indianapolis. The majority against admitting him is said to have been small. This is a very unusual proceeding and has caused much comment, mainly because of the prominence of a certain kind which the rejected applicant enjoys. Mr. Coughlin has been an alderman from the First Ward for twenty years and several more. He has gone by the name of "Bathhouse," and he and his colleague from the First, Michael Kenna ("Hinckey Dink"), are probably the most noted or notorious aldermen in the United States. Muckrakers have written them up and reformers have inveighed against them as exponents of the worst in municipal politics, but their constituents have returned them to office as regularly as elections came around.

For some years Alderman Coughlin has been an insurance broker. He was reputed to have a line of business which many offices were glad to get because they could make money on it. Men who are believed to know have stated that some of this business occasioned the alderman no trouble in its handling, as the assured gave the whole line to the agent, but instructed him to treat a certain amount of its as Coughlin's business. Early in October Managing Underwriter L. S. MacEnaney, of the Columbian, appointed Alderman Coughlin Cook County manager of the company and felt that he had made a ten-strike in getting him for representative, as it insured the company a good volume of profitable business. The possibility of the action which has just been taken was discussed, but it was not regarded as a probability.

Onlookers are divided in opinion as to the wisdom of the executive committee's action. It is readily known that one with the political reputation of the alderman would not raise the standing of the board in the opinion of many good citizens and objections to having an active city official as a member of the board are also recognized. On the other hand, it is pointed out that no objection was made to his acting as a broker, he took the agency of the Columbian in good faith, expecting to become a member of the board, and he is a man of such influence that he can make plenty of trouble for the board if he concludes that he has been unfairly treated, as he presumably has done already. The alderman has intimated that the executive committee "may change its mind."

* * *

The day after the Northwest meeting in October representatives of the various State fire prevention associations held their annual meeting. On that occasion somebody mentioned the fact that the inspection of a certain town by a party of field men had been spoken of as a junket and that citizens had complained of the amount of drinking done. The Committee on Publicity felt it wise to call the attention of all State associations to the subject and caution them that these inspections cost the companies considerable money, that much of their benefit arises from securing the good will and co-operation of the citizens and that care should be taken to avoid giving offense. It appears now that some of the associations took exception to the letter and regarded it as a reflection upon them and their members.

* * *

Movement for Uniformity in State Laws.—At the conference of Governors at Madison, Wis., last week a strong sentiment developed in favor of endeavoring to secure greater uniformity in laws of certain classes in the various States. Governor Dunne, of Illinois, read a paper on uniformity in safety and sanitation laws in which he stated that failure to enact legislation of this character grew out of fear on the part of legislators that they would drive industries from their States into others having less strict regulations. The effect of workmen's compensation laws in different States placing different burdens on employers was pointed out by another speaker as similar. Finally it was decided to appoint Governors Dunne of Illinois, Eberhart of Minnesota, and Walsh of Massachusetts to issue a call for the Governor of each State to appoint commissioners, not over three in number, to meet at some central point and endeavor to agree upon certain principles which should be followed in the drafting of workmen's compensation laws.

In a discussion of the features of various workmen's compensation laws, Governor Dunne is reported to have said that since the Massachusetts law was amended it was the best law on this subject in the country. This is significant, as Governor Dunne has been suspected of leaning towards State insurance and the Massachusetts law does not even provide for State insurance as one option.

* * *

Surety Association of Chicago Drafts New Court Rule.—The Surety Association of Chicago has had a committee at work drafting a new court rule, which it hopes to have the Chicago Bar Association recommend to the Circuit Court judges for adoption in

place of one promulgated in October. The Bar Association became disgusted at the tactics of certain surety companies, which failed to meet their obligations when they became fixed but litigated and forced obligees to unnecessary delay and expense. Especially was this objected to where companies had executed appeal bonds and when the judgments were affirmed on appeal had sought to compromise or had set up unmeritorious grounds against paying the judgments. The Bar Association therefore drafted a rule and secured its adoption by the Circuit Court judges declaring it to be the duty of surety companies to pay their obligations when they become fixed and not to force obligees to sue them, and providing that companies violating this obligation should be disqualified to act as sureties in the Circuit Court. It also provided that every surety company that desired to qualify with the court should file a petition during February of each year setting forth its authority to do business in Illinois, a list of all bonds executed by it in that court during the previous year, and any suits started or pending against it on bonds in that court. The rule also provided for a hearing on this petition, advertisement of it, giving opportunity for any interested party to object and also for summary disqualification of the surety company to do business in that court.

What the surety men particularly object to in the rule is the requirement for filing a list of all bonds executed in the court. Not only is this laborious and expensive, but it would advertise to competitors just what business a company has. They will ask the elimination of this provision. They fear that if the Cook County Circuit Court makes a requirement with such a provision it will be followed as a precedent by other courts and possibly by administrative officers and boards, resulting in a vast amount of labor which really produces no indication of the character of the company as a surety.

* * *

Latest figures on the vote of the Nebraska workmen's compensation law referendum show that the people approved the act by 6,700 majority. The Governor will issue a proclamation putting the law in effect on December 1.

Chicago, November 20, 1914. LA SALLE.

ITEMS OF INSURANCE NEWS.

It is apparent, now, that there will be no Supreme Court decisions under the New York Workmen's Compensation Act this year. Of the twenty cases of claims under the New York Workmen's Compensation Law that have been appealed from the State Workmen's Compensation Commission to the Appellate Division of the Supreme Court, Third Department, sitting in Albany, all except a minor case went over this week to the January term. The expectation was that arguments on the constitutionality of the acts of the Legislature at the close of the special session last year and in March at the regular session this year would be heard at the November term, but the preparation of briefs on the important questions could not be completed. To the commission that Governor Glynn appointed, under the terms of chapter 261 of the laws of 1914, to compile and further data relative to the duties to the convention to revise and amend the constitution is to be submitted on the subject of workmen's compensation will be the first legislative action to clarify the situation and establish the principle on constitutional lines.

According to the "Spectator," New York, "it is expected that, before the end of the year, between seventy and ninety employes will be dropped by the New York State Workmen's Compensation Commission. This is in addition to the twenty-three men discharged before election. It is stated that the action has no political significance, as the men are said to have been employed only temporarily."

It is to be hoped that when this reorganization is completed, the Commission will be able to improve its rather laggardly record of handling compensation cases from one case a minute to two cases every forty-five seconds.

The Ohio Supreme Court last week decided the four cases brought before it from Hamilton County on appeal, sustaining the provision of the workmen's compensation law that compels municipalities to pay into the State Fund and protect public employes. It was contended that the act contemplated the use of public money raised for the taxation for other than public purposes. The court is understood to take the view that to provide for public employes injured in serving the public and to provide for dependents of those killed are public duties.

The American Federation of Labor, at its convention held in Philadelphia, adopted a resolution which asked the Federation to urge the New York Legislature to amend the workmen's compensation law so that no physical examination of employes will be necessary before they are given work by an employer. The resolution charged that certain employers in New York State are requiring applicants for work to undergo a physical test in order to give them an opportunity to discriminate against union labor.

The Attorney General of Iowa has ruled that under the workmen's compensation law of that State employes cannot recover damages because of disfigurement due to accident, provided their ability to earn a living is not impaired. The Illinois law makes special provision for any serious and permanent disfigurement, and a similar provision will be sought for the Iowa law. A short time ago, the Illinois Industrial Board passed upon the merits of a case involving the disfigurement provision of the compensation law of the State. A workman was injured by a piece of tiling falling and striking him on the head, in the course of his employment. The Board held that to entitle a workman for compensation under the provision of the law in question the disfigurement must be of such a character as to affect his earning capacity, in that it makes him less aggressive and more timid, and possibly subject him to rejection when seeking employment at various kinds of work he may be fitted for. In other words, the term "disfigurement" as used in the Workmen's Compensation Act, to entitle a claimant under the law to compensation, must in reality disfigure the claimant to such an extent that it will interfere wih his securing employment.

The test suit brought by the Indiana Insurance Department against the Continental Insurance Company, claiming back taxes for a number of years, has been decided by Judge Orbison, at Indianapolis, in favor of the company. The Indiana law provides that fire insurance companies shall pay a tax of 3 per cent on premiums received, less losses paid. The companies, in making their returns, have always deducted return premiums and cancellations and premiums on policies not taken, which had been charged on the books when the policies were issued but for which no money had ever been received. Suit was begun early in 1913 against the Continental to recover the tax on these deductions, which amounted to $13,589.54. In addition, the claim was made that since Indiana companies reporting in New York were charged 2 per cent on their premiums with no deduction in losses, under the reciprocal law the same tax should be imposed by Indiana upon the New York companies, and on that basis the amount due was $43,287.46.

The court held that under the Indiana 3 per cent law on premiums less losses the company had the right to deduct all return premiums, all concellations and all premiums charged on the books of the company where the policy had never been delivered or the premium paid by the insured. The court also found that the company had fully paid the tax required under the Indiana law and owed the State nothing. The New York law of 2 per cent on gross premiums in fire department towns, with no deductions for losses, did not apply, and if it did apply, nothing would be owed, for the amount paid under the Indiana law was more than would be due under the New York law, as it applied only to protected towns in Indiana.

The Supreme Court of North Carolina has upheld the fire insurance agents in their contention that their commission is earned when the policy is issued, and that return commissions are not required in case of receivership. The decision by the North Carolina Supreme Court was given in a case arising out of the American Union receivership. The decision of the Supreme Court reviews both the law and the facts exhaustively, and holds "the commission paid to an agent for writing a policy of insurance is paid as compensation of his work in securing the business and running the agency for the company. If the company fails as this one did, as between the company and the policyholder, the latter is entitled to recover the full amount of an unearned premium, but between the local agent and the company, the former has done his work by securing and writing the policy, and the subsequent default of the company cannot entitle it to recover from the agent any part of his commission. This would entitle the company to profit by its own wrong or default."

According to a report recently issued by the United States Bureau of Mines, the fatalities among coal miners during 1913 were 425 in excess of the previous year. The total number of those who met death last year while at their employment was 2,785. The fatality rate last year was 3.82 in every 1,000 men employed, as compared with 3.27 in 1912. Commenting upon the record for the past year, the director of the bureau calls attention to the fact that while there was an increase of only about 8 per cent in coal production during 1913 over that of the previous year, there was an increase of 18 per cent in fatal accidents to the miners. While the total deaths from mine explosions were 212 greater in 1913 than during the previous year, the number of explosions in which more

than five men were killed was only seven, as compared with ten explosions in 1912.

The "Baltimore Underwriters," in a recent issue, publishes the figures for fire insurance premiums written in Baltimore during the first six months of 1913 and 1914, according to reports to the Baltimore Fire Insurance Salvage Corps. These figures show a total of $1,072,301.83 written between January 1 and July 31, 1914, as against $1,129,951.17 for the corresponding period in 1913.

Under a revision recommended by the Virginia Tax Commission in its report submitted to the Governor, life insurance companies are to pay 2¼ per cent on gross premium income, while fire insurance companies will pay the same rate as the casualty companies. Heretofore the latter have been paying a rate of over 4 per cent. Casualty and miscellaneous companies would be taxed at the rate of 2¾ per cent. Sick benefit concerns whose rate has been ½ per cent will now pay 1 per cent. It is stipulated in the plan recommended that the tax on gross premiums replace all other forms of insurance taxation and that each separate locality in which policies are written is to receive one-fourth of the amount collected for taxes in its community.

In a Consular report dealing with the improved financial position of the Italian money market during 1913 it is stated that a further step toward improving the financial situation was the nationalization of insurance. The National Institute of Insurance began operations on January 1, 1913, in accordance with the law passed two years ago, by the terms of which all classes of insurance in Italy became a State monopoly. At the beginning of the year the assets of the Insurance Institute were 30,000,000 sterling, contracts amounting to £6,400,000, and the annual premium receipts to nearly £1,200,000. Since then the business transacted has, it is said, exceeded expectations, and it is anticipated that this insurance monopoly will become a great financial force at the disposal of the Government. The amounts held have already been employed for loans for railroad construction and other enterprises.

Life insurance companies are finding the same difficulty about the valuation of securities on December 31, 1914, that American insurance companies had feared in making up their annual statements for 1914. In the United States, as need not be said, the difficulty has been temporarily solved by the adoption by the various insurance departments of June 30, 1914, as a date of valuation. In Great Britain the question is still undecided. "The Insurance Observer," of London, speaking editorially on the subject, says:

"An unusual number of important life assurance companies complete their quinquennial investigation periods on December 31 next or early in the year 1915; and there are also many offices which have adopted the principle of annual valuations. Special interest therefore attaches to the forthcoming investigations, and the decision of the Government with respect to the valuation of securities is being awaited with some anxiety. Under the provisions of the Assurance Companies Act, 1909, Stock Exchange securities have to be valued in accordance with the statutory rules then made. * * *

"It is simply impossible, indeed, to imagine that life offices whose valuations have to be made on December 31 next or shortly afterwards will be compelled to adopt the quotations ruling at the date of investigation. The real question is in what way an unanticipated difficulty can best be met. Various suggestions have been made, but none of them seems to be entirely satisfactory. Prices might be taken as on December 31, 1913, June 30, 1914, or July 31, 1914, or the average of the five years 1909-13 or 1910-14 might be adopted as the basis. Objections to either of these proposals seem possible on the ground that even justice would not be administered all round. This can scarcely be denied, seeing how various are the investments favored by different offices. An alternative course would be to suspend the obligation to make any valuation until, say, a clear twelve months or two years had elapsed from the declaration of peace. Probably this might prove the wisest course in the extraordinary circumstances that exist. It would be fair to all companies alike, and it would allow reasonable time for the recovery of values. Moreover, it would relieve those companies which now make annual valuations from the necessity to alter their present system. Under the Act a valuation has to be made not less frequently than once every five years, and directors have the right to decide whether the investigation required by law shall be made at the end of one, two, three, four or five years. Offices which valued as on December 31 last need not therefore repeat the task until December 31, 1918, and it almost goes without saying that unless the law is altered the fullest advantage might be taken of this permission."

New Edition

Containing Analysis Laws of Twenty-three States

Bradbury's Workmen's Compensation and State Insurance Law

Second Edition, rewritten, enlarged and every topic greatly amplified by Harry B. Bradbury of the New York Bar

ABOUT 2500 PAGES——TWO VOLUMES

CANVASS BINDING——PRICE $13.00, EXPRESS PREPAID

THIS new edition contains a complete and lucid analysis of the laws of twenty-two States of the Union which have passed such acts, together with complete texts of the statutes as amended.

It contains also the texts of the Federal Compensation Act, applicable to certain employees of the United States Government, as well as the complete texts of the British Act, all the statutes passed by the various Canadian Provinces and the German Insurance Code as in force on January 1, 1913. There is also appended the British National Insurance Act which has an important bearing on the compensation principle.

To this has been added matter which is more important still and more difficult to secure, consisting of several thousand decisions of the Courts of the various States of the Union and of England, Scotland, Ireland and Canada; together with rulings of various industrial commissions, accident boards and Federal and State Departments having jurisdiction of the administration of the various Workmen's Compensation Statutes.

All this wealth of material is logically and scientifically arranged so as to be easily accessible and a carefully prepared and an exhaustive index and complete table of cases make it possible to turn to any particular subject with the least possible difficulty.

That describes the happy relation existing between the Fidelity and its Field Men, and explains why both are forging ahead. Maybe you could reach a higher success in that atmosphere. Write to—

The Fidelity Mutual Life Insurance Company

WALTER LE MAR TALBOT, President. OF PHILADELPHIA

Desirable openings in good territory for the right men

January 1st, 1914

Atlantic Mutual Insurance Company

ATLANTIC BUILDING

51 Wall Street, New York

INSURES AGAINST MARINE AND INLAND TRANSPORTATION RISK AND WILL ISSUE POLICIES MAKING LOSS PAYABLE IN EUROPE AND ORIENTAL COUNTRIES.

Chartered by the State of New York in 1842, was preceded by a Stock Company of a similar name. The latter Company was liquidated and part of its Capital, to the extent of $100,000, was used, with consent of the stockholders, by the Atlantic Mutual Insurance Company and repaid with a bonus and interest at the expiration of two years.

During its existence the Company has insured property to the value of	$27,219,045,826.00	
Received Premiums thereon to the extent of		$282,298,429.80
Paid Losses during that period	$141,567,550.30	
Issued Certificates of Profits to dealers	$89,740,400.00	
Of which there have been redeemed	$82,497,340.00	
Leaving outstanding at present time	$7,243,060.00	
Interest paid on Certificates amounts to	$22,585,640.25	
On December 31, 1913, the Assets of the Company amounted to		$13,259,024.16

The profits of the Company revert to the assured and are divided annually upon the premiums terminated during the year, thereby reducing the cost of insurance.

For such dividends, certificates are issued subject to dividends of interest until ordered to be redeemed, in accordance with the charter.

Things and actions are what they are, and the consequences of them will be what they will be; why then should we desire to be deceived?—Bishop Butler's Sermons at the Rolls.

AMONG the stamp tax provisions of the new so-called War Revenue Tax Act [Public—No. 217—63d Congress], which go into effect on Tuesday next (December 1, 1914), are the following having reference to insurance:

"Insurance: Each policy of insurance or other instrument, by whatever name the same shall be called, by which insurance shall be made or renewed upon property of any description (including rents or profits), whether against peril by sea or on inland waters, or by fire or lightning, or other peril, made by any person, association, or corporation, upon the amount of premium charged, one-half of 1 per cent on each dollar or fractional part thereof: *Provided*, That purely co-operative or mutual fire insurance companies or associations carried on by the members thereof solely for the protection of their own property and not for profit shall be exempted from the tax herein provided: *And provided further*, That policies of reinsurance shall be exempt from the tax herein imposed by this paragraph.

"Each policy of insurance, or bond or obligation of the nature of indemnity for loss, damage, or liability issued, or executed, or renewed by any person, association, company, or corporation, transacting the business of fidelity, employer's liability, plate glass, steam boiler, burglary, elevator, automatic sprinkler, or other branch of insurance (except life, personal accident and health insurance, and insurance described and taxed or exempted in the preceding paragraph and excepting also workmen's compensation insurance carried on by the members thereof solely for their own protection and not for profit), and each bond undertaking or recognizance, conditioned for the performance of the duties of any office or position, or for the doing or not doing of anything therein specified, or other obligation of the nature of indemnity, and each contract or obligation guaranteeing the validity or legality of bonds or other obligations issued by any State, county, municipal, or other public body or organization, or guaranteeing titles to real estate or mercantile credits executed or guaranteed by any liability, fidelity, guarantee, or surety company upon the amount of premium charged, one-half of 1 cent on each dollar or fractional part thereof: *Provided*, That policies of reinsurance shall be exempt from the tax herein imposed by this paragraph."

Very few persons outside the insurance business,—or in it, for that matter,—have more than the vaguest notion of the extent of the pecuniary burden which is imposed, either upon the business of insurance itself or else upon persons requiring insurance,—by the above provisions of the emergency revenue act. Even Congress itself, supposing that it made use of the best information available, can have had only a most inexact idea of the aggregate amount of the insurance premiums which will be subjected to the tax of one-half of one per cent, or of the sum which will be yielded by the tax. There are no statistics in existence, so far as we know, from which can be derived the precise amount of premiums,—net of reinsurance premiums and excepting premiums of co-operative or mutual fire insurance associations and of mutual workmen's compensation insurance associations,—which are annually collected by the persons and corporations writing in the United States the various forms of insurance enumerated. It happens that the annual reports furnished to the various State insurance departments by legally recognized ("admitted") insurance companies or underwriters' associations do not supply the required information, except approximately and by deduction, even for the reporting companies and associations, while a very large aggregate of insurance is written in the United States by non-reporting insurers, whether "surplus line" foreign companies or Lloyds, London. As a rough approximation it may be stated that the tax will probably be collected upon at least $500,000,000 of insurance premiums during the thirteen months (December 1, 1914, to December 31, 1915) for which this Revenue Act is to be in force, according to its terms. Hence, the total sum contributed by insurance during that period may be expected to be something like $2,500,000. In other words, the economic losses of the country,—for insurance is only a transmuted form of economic loss,—during the next thirteen months are to be increased by the sum mentioned. This remark may perhaps be regarded as collateral; but it is well upon every occasion to insist that any and all taxation of insurance as such, rather than of the mere profits of the business of insurance, is indefensible upon economic grounds.

By far the largest part of the tax of $2,500,000 thus imposed upon insurance will be collected from fire insurance. The country's fire waste, about which there is so great a hue and cry in these days, will be swelled *pro tanto*. Again it is impossible to give with exactitude the amount of the burden, though an approximation may be arrived at. Before undertaking to obtain this, however, it is worth while to point out that the burden will be very unequally distributed in respect of the insurable property in the country. Thus, all persons fortunate enough to have taken out three-

year policies, covering buildings or other property, within the past year and eleven months, will themselves escape the tax altogether, as will the insurance companies in connection with those policies. On the other hand, the total premiums on three year policies issued within the next thirteen months will be taxed, despite the fact that a portion (growing greater as time goes on) of the premiums really represent the cost of the insurance after the expiration of the Revenue Act. More striking still, however, is the necessary doubling up of the tax upon the materials and products of agriculture, industry and trade, as these move along their course of production, manufacture and distribution. For instance, it has been calculated that cotton passes through the hands of at least eight owners, on the average, from the time it is sold by the farmers until it is finally distributed in the form of finished goods to the consumers. The period of this passage from farmer to ultimate consumer is from eight months to a year. Each successive owner procures fresh fire insurance upon it, paying a new premium which will be taxed. Hence cotton manufactured and distributed as goods in the United States during the next thirteen months will be taxed some 4 per cent of the aggregate of the short-rate premiums paid for its insurance against fire by the cotton merchants, cotton manufacturers and dry goods merchants who handle it in its successive forms. The same will be true, though in widely varying degrees, in all other departments of production and distribution.

It has been said that a mere approximation of the total annual burden of the new tax upon fire insurance is the best that can be attained, with the aid of the available statistics. Perhaps the most complete and accurate figures for the business of the fire insurance companies proper in the United States,—these being the insurers upon whose premiums the bulk of the tax must fall,—are to be found in the "Fire Insurance Tables" of Mr. Harrison Law, of Nutley, N. J. These tables analyze the results obtained by 175 fire insurance companies,—more than are included in the reports of any one State insurance department, even that of New York. An examination of Mr. Law's figures shows that, in 1913, these 175 companies took in gross premiums to the amount of $508,842,730, of which, however, $102,071,728 was taken in by companies doing a reinsurance business alone and hence is not taxable under the new law. The deduction of this latter amount leaves the gross premiums taken in during 1913 by the direct writing companies at $406,770,980. But the direct writing companies also do a large amount of reinsurance among themselves, and they likewise receive [illegible] policyholders cancelling their insurance large sums [illegible] premiums. On such reinsurance premiums [illegible] one to the other there is no tax; but the law does provide for a refund of the tax originally paid upon such premiums [illegible] premiums are later returned or unearned. Now, Mr. Law's tables show [illegible] premiums of the 175 companies in 1913 [illegible] premiums, less the reinsurance [illegible] net premiums was $350,004,156. Consequently, the amount [illegible] statistically unknown quantity of the [illegible] premiums may be assumed to be the amount of the [illegible] of these 175 companies in 1913, [illegible] in that year. In other words, [illegible] per cent of an amount of premiums [illegible] 004,156 and $406,770,980 represents the [illegible] of the tax upon fire insurance, assuming that the 1915 figures show merely a normal gain over the 1913 figures, and in so far as the business of the 175 chief fire insurance companies comprehend the fire insurance written in the country. Whatever the premiums may be for the unregistered insurers, such as foreign "surplus line" companies and Lloyds, London, these must be added to the amount indicated. Perhaps we shall not be far astray if we put the grand total of taxable fire insurance premiums for the thirteen months during which the Revenue Act will be in force, at $400,000,000. This will mean an aggregate tax of $2,000,000, to be met by fire insurance alone. It may be added that the National Board of Fire Underwriters estimates the tax at the still higher figure of $2,500,000, particularly on the ground that there can be no refund of the tax paid upon the vast number of policies issued, but for one or another reason returned as "not taken" by the applicant for insurance. The effort in the present article, however, is to reach independently figures that may be regarded as the irreducible minimum.

No sooner had the new Revenue Act been passed than the question arose as to who should bear the burden of this tax upon insurance, the insurance companies or the insured. The natural inclination of the insurance companies at the start was to assume the tax themselves, because small additional charges are always vexatious and tend to the irritation of customers. When, however, the managers of fire insurance companies began to study the facts in relation to their business as a whole, and particularly in relation to the profit and loss account of fire insurance in the United States, they speedily perceived that the assumption of an aggregate additional expense of $2,000,000 to $2,500,000 was wholly inconsistent with the general financial situation in which they find themselves. What this situation is has been brought out in a statement issued by the National Board of Fire Underwriters, covering the experience of all but a few of the fire insurance companies for the past ten years. This statement shows that during that period the companies received net premiums of $2,675,312,651, paid losses of $1,502,-58[illegible]35, had expenses of $1,029,968,802, increased their liabilities by $159,010,051, and consequently made an underwriting loss on all the business done of $16,775,237. On the basis of these figures the Board reached the conclusion that the business of fire insurance in the United States is in no condition to undertake an additional expense of from $2,000,-000 to $2,500,000 a year, but must look to the buyers of fire insurance to pay for the stamps which the Revenue Act requires to be affixed to their policies.

This conclusion of the Board, with the accompanying recommendation to the member companies, has provoked vehement protest on the part both of insurance officials and of representatives of important buyers of fire insurance. The active and ingenious Mr. Herman L. Ekern, Insurance Commissioner of Wisconsin, has made public a proposed ruling on the subject, which he evidently hopes to have adopted in principle by his fellow insurance commissioners representing other States. This ruling is as follows:

"The Federal tax of one half per cent on stock fire insurance premiums is payable by the fire insurance companies under the Federal law.

"While insurance companies fix their rates for fire insurance in Wisconsin without regulation or control by the State, the insured cannot be required to furnish or affix the internal revenue stamp, or to pay anything which is not spe-

cified in the policy as a part of the premium, as required by Sections 1941-43.

"If the company attempts to impose this tax upon the insured, the agent cannot pay it without violating the anti-rebate law, Section 19550.

"The fact that a tax on insurance, over which the Federal Government exercises no jurisdiction or control, may be wrong in principle, does not justify the stock fire insurance companies in requiring its payment by the policyholders."

In this proposed ruling Mr. Ekern appears to rest his case upon a purely technical interpretation of the language of the Revenue Act, and not upon any asserted substantial equity in the matter. Even so, he completely neglects the record of the deliberations of the Committee on Ways and Means, which framed the law, and of the expressions of opinion in the debates upon the subject in Congress itself, which the National Board of Fire Underwriters has properly pointed to as indicative of an intention and expectation on the part of the legislature that the tax should be borne, not by the insurance companies, but by the insured.

More vehement in manner and attempting to assert a substantial inequity in the position of the fire insurance companies is a protest contained in a public letter appearing in the Chicago "Herald," of November 24, from Mr. Arthur Hawxhurst, insurance manager of the great house of Marshall Field and Company. This gentleman undertakes to criticize destructively the figures and the contentions of the National Board of Fire Underwriters, and to show that the insurance companies are not only able, but in duty bound, to meet the expense of the new tax out of their own resources. He points to the invested assets of the fire insurance companies,—some $700,000,000, as he declares,—and asserts that these assets should earn in interest alone some $40,000,000. He remarks that of these assets no less than $300,000,000 represent unearned premiums, which really belong to policyholders, being premiums paid in advance, whose use the companies enjoy. "In fact," he says, "the profits of the fire insurance business nowadays are made largely upon its debts,"—in short, are of the same character as those of the banking business. And then he falls back upon the familiar argument that Mr. Brandeis has made famous in connection with the matter of the increase of railroad rates,—i. e. that the expenses of fire insurance are too high and the efficiency is too low. Let the companies save the amount of the tax by reducing salaries, commissions and other unnecessary and unjustifiable expenditures and by "more conservatism and better judgment in underwriting; adjustment of losses and other expenses." And, finally: "If the companies cannot pay the legitimate taxes put upon their business, the same as all other business men have to bear, then let them, as members of the National Board, get together and agree to reduce their present excessive expense account by eliminating at least all those persons now receiving liberal compensations but not legitimately connected with the business of insurance nor in any way adding to its value."

There could scarcely be a better illustration of superficial and unconvincing argumentation that this. Were it not for the commanding position which Mr. Hawxhurst occupies and the widespread influence of his published opinions upon the minds of large buyers of fire insurance throughout the country, little attention need be paid to his letter of protest. But this is a time when it is important to criticize sharply all persons in a large way of business who show themselves wrong-headed. Nine-tenths of the recent political troubles of business have come from the senseless attacks of one set of business men upon another. This is the great source of the material of the popular politicians. So, in the case of Mr. Hawxhurst it is well to point out the incongruities of his allegations.

We may begin by remarking upon one or two of his assumptions. It is not true that "all other business men have to bear" the taxes imposed upon their business or their goods. Marshall Field and Company do not do it; they add the taxes to the selling prices of their goods. And they do this with all other increasing costs, such as higher interest rates, wages and salaries, and so on. It is not true, *ipso facto*, that an expense ratio of 38.5 per cent is excessive in a retail business, such as fire insurance predominantly is. If Marshall Field and Company can show as low an expense ratio as this for their great retail shop in Chicago, they are surpassing any department store experience with which we are acquainted. It is not true as a general rule that inordinate salaries are paid to officers and managers in a business of which Mr. Hawxhurst himself says: "Insurance is a technical and complicated business, having many elements of chance in it not applying to general business." We are of the opinion that a list of the salaries paid to the department managers and expert buyers of Marshall Field and Company would compare very unfavorably, from the point of view of exorbitance, with any list of salaries of fire insurance managers and officers that could be drawn up, even for the largest companies.

The quintessence of the thing, however, does not lie in these after all superficial details. Fire insurance is a highly competitive business, and its expenses (including salaries and commissions) have come to be what they are through competition, just as much as have its returns. The true point of consideration now is whether fire insurance, under existing conditions, has been found by those supporting it with their capital sufficiently remunerative to enable them to forego such part of their remuneration as will meet this new tax of $2,000,000 to $2,500,000 a year. In no country in the world is fire insurance as a whole so unremunerative as in the United States. In proportion to the risks undertaken it is scandalously underpaid. Turning again to Mr. Law's tables we find that in 1913 the 175 fire insurance companies there enumerated wrote an aggregate amount of insurance of $52,317,720,854, receiving gross premiums of $508,842,736. They had, moreover, as Mr. Hawxhurst himself has pointed out, invested assets of some $700,000,000, on which they should have earned, according to him, $40,000,000, but actually did earn barely $30,000,000. And yet the entire amount of the distributed earnings of these 175 companies,—being dividends declared by the American companies and net remittances to the home offices of the foreign companies,—was only $20,540,946. And now the companies have to face within the next year or two, as an inevitable consequence of the European War with its mountainous national loans, a depreciation of the market value of their investments, which no competent economist would estimate at less than 10 per cent and few at less than 20 per cent. This single fact is enough in itself to make it pure lunacy for the companies to try to assume the burden of the new tax.

Arthur Richmond Marsh

ECONOMIC CONDITIONS IN JAPAN AND THEIR IMPLICATIONS

IN its appeal to the imagination, the rapid rise of Japan to a position among the leading nations of the world will always have a peculiar interest. As late as the year 1850 the Empire was as completely shut off from commercial contact with Western civilization as the remote regions of Tibet. It was not until 1871 that the feudal system was entirely suppressed and the government developed in the direction of centralized authority sufficiently to enable it effectively to encourage foreign trade. In a little over forty years Japan has assumed an unquestioned industrial pre-eminence in the Far East.

However, in forming an accurate estimate of comparative economic conditions, it is necessary to avoid undue emphasis of political, as contrasted with industrial or commercial elements in national growth. It may be properly pointed out that the year 1871 also marked the entrance of Germany into the world's competitive markets. With a population only one-sixth larger than that of Japan, the foreign trade of the German Customs Union in 1913 was over nine times as great as that of Japan. Indeed, on the basis of foreign commerce alone it would be difficult to understand the important position in the affairs of the world which the Japanese have unquestionably attained. This point will be brought out more clearly by a comparative view of the value of imports and exports of Japan and of six other countries. The figures are set out in the following table:

FOREIGN TRADE OF SEVEN COUNTRIES, 1913.
(In round figures.)

	Imports.	Exports.
Japan	$303,000,000	$261,000,000
Brazil	308,000,000	363,000,000
China	360,000,000	275,000,000
Australia	380,000,000	370,000,000
Switzerland	382,000,000	262,000,000
Italy	714,000,000	462,000,000
Belgium	957,000,000	763,000,000

This table brings out forcibly enough the fact that the trade position of Japan is not, on the basis of its actual value, one of first magnitude. It emphasizes a certain lack of proportion in regarding Japanese affairs which has been especially manifest in this country of late years, and which is a very important obstacle to a proper realization of Japanese conditions or to a reasonable estimate as to their future tendency. It may fairly be said that the lack of proportion which has been referred to is not entirely unnatural. It was the United States which first succeeded in conveying, through Commodore Perry in 1853, an invitation to Japan to participate in the intercourse of Western nations. The energy with which the Japanese accepted the invitation soon won for them the nickname of "Yankees of the East." The fantastic stories which had made their way westward in the days of the Shogun, and upon which the American conception of the Empire was almost exclusively based, formed a background of tradition against which the new Japan, reorganizing itself along modern lines, stood forth in brilliant relief. In 1898 the Japanese became our neighbors, when we found ourselves in the Philippines; and they now constitute over 40 per cent of the population of Hawaii.

These facts, combined with the still unsettled difficulties regarding the admission of Japanese into California, have served to magnify the position of Japan in the popular imagination, and even to inspire, on the part of many, jingoistic utterances which tend to undermine the cordial understanding between the two countries, and consequently to prejudice the commercial intercourse which they have mutually endeavored to develop. As has been suggested, such a tendency is not hard to understand, but it is beyond question unfortunate; and an examination of economic conditions in Japan itself must lead to the conclusion that it is also unjustified by the facts. It will be of interest to review these facts briefly.

The islands of Japan, several hundred in number, have a total area of 147,700 square miles, or approximately that of the State of Montana. The area of the United Kingdom is 121,316 square miles. The population of Japan averages 354.18 per square mile, as against 376.31 per square mile in the United Kingdom. The actual population, in 1913, numbered 52,985,423, as against 45,370,530 in the United Kingdom. The largest cities, with their population according to the last census (that of 1908), are as follows: Tokyo, 2,099,181; Osaka, 1,226,590; Kyoto, 442,462; Yokohama, 394,303; Nagaya 378,231; Kobe, 378,197; Nagasaki, 176,480. Osaka bears somewhat the same relation to Western Japan as Tokyo bears to the Eastern part. Kobe is the port of Osaka, and Yokohama is close enough to Tokyo to serve as its port. Japanese railways reached a total mileage of 7,000 in 1913, as against 23,000 miles in the United Kingdom in the same year.

Japan is primarily an agricultural country. Sixty per cent of the population are principally occupied in raising food for the nation; and, of these, 70 per cent are on farms of less than 2½ acres each. The total area of Japan amounts to nearly 95,000,000 acres, of which only 14,190,215 acres, or 15 per cent, were under cultivation in 1912. Of the 78,000,000 acres in the British Isles, 46,793,747 acres, or 61 per cent, were under cultivation in the same year. In other words, Japan with a larger total area than that of the United Kingdom, has only 30 per cent as great a tillable area. It is interesting to note, however, that the value of Japan's total exports was only 11 per cent of that of the United Kingdom in 1913. To take another country for comparison, Italy with its 110,688 square miles, or 70,400,000 acres, has a tillable area of nearly 50 per cent. Japan's tillable area, therefore, is 40 per cent of that of Italy, and the value of Japan's exports is 56 per cent of that of Italy.

From the point of view of the achievement of the people it may be said that the tillable area of Japan is lower in proportion than that in any countries except Sweden and Norway. And the population per square mile in Japan is over 354.18, while that of Sweden is only 32.44, and that of Norway only 19.19.

Two-thirds of the area of Japan is covered with mountains. The rivers have short and precipitous courses,—a fact which prevents the alluvial deposits favorable to agriculture. Over all the land is spread a network of streams and brooks. The combination of this physical characteristic of the country with the mildness of the climate produces a condition ideal for the raising of rice, the principal food of the people, which is produced, according to Japanese statements, in over two thousand varieties. The strictly limited area of production, and the heavy annual requirements for food products, prevent the setting aside of fallow fields. The persistence of the national taste prevents the rotation of crops. Hence there is a heavy demand for fertilizers, which, owing to the absence of live-stock in considerable numbers, must be largely imported. It is estimated that the annual value of such importation is over $50,000,000.

Horses and cattle are rare. In the first place, pasturage is poor. In 1913, it was estimated that the country afforded only 96,544 acres of grazing ground out of a total area of 95,000,000 acres. In the second place, the small size of the farms and the extremely common terrace construction for purposes of drainage, render the use of animals for agricultural purposes inconvenient. Then, too, the tremendous population can best find its employment

in farming pursuits, and the need for labor-saving animals has hardly begun to be keenly felt. Rice is the leading crop. In 1912, the quantity produced was more than double that of all other crops combined, amounting to nearly 250,000,000 bushels. Despite this large crop, rice was imported into Japan in 1913 to the value of over $28,000,000. It is a Summer crop, sown in May and June, and harvested from August to November. In many places the rice fields are drained in the Fall, and Winter crops of wheat and barley are raised on the same ground.

The variety and extent of Japanese agriculture may be seen in the following table covering the year 1910:

CROP ACREAGE AND CROPS IN JAPAN, 1910.

	Acres.*	Bushels.		Acres.*	Bushels.
Rice	7,226,000	235,213,000	Millet	73,000	1,952,000
Barley	1,520,000	46,456,000			Tons.
Naked barley	1,656,000	33,580,000	Sweet potato	723,000	3,349,000
Wheat	1,195,000	23,910,000	Potato	152,000	589,000
Soya bean	1,137,000	18,834,000	Leaf tobacco	72,000	42,000
Italian millet	476,000	11,137,000	Tea	124,000	30,000
Buckwheat	385,000	6,370,000	Indigo	22,000	15,000
Rape seed	343,000	5,260,000	Hemp	31,000	9,000
Small red bean	331,000	4,513,000	Seed cotton	10,000	4,000

*A portion of the acreage is used for more than one crop.

The position of the agricultural population in Japan is not an easy one. Taxation is, from the American point of view, excessively heavy. Accurate figures, on a basis intelligible to Western minds, are difficult to obtain. It is estimated, however, that the farmer's annual land tax amounts to 8 per cent of the value of his field, and that this combined with other annual dues brings his total direct tax up to approximately 12.5 per cent annually upon the value of his holding. As a result of this heavy taxation the farmer and his family find it necessary to occupy their extra time in industries such as silk culture, the manufacture of straw braid, matting, fans, baskets and rope. Along the sea-coast fishing is combined with farming. In these ways the family income is often increased as much as 25 per cent. The average agricultural yield of the country is placed at nearly $650,000,000, and the return from home industries at $150,000,000.

Reference has been made to the burden of taxation under which the farmer labors. Before touching upon the industrial and the commercial conditions in Japan, it will be worth while to turn for a moment to the matter of the public debt. The change from the feudal system to the present Imperial status necessitated paying off the debts of the feudal domains which the Government took over. These outlays, together with expenses immediately necessary for relief of internal conditions, brought the public debt in 1879 up to over $125,000,000. In 1895 came war with China. In 1900 the total debt had reached over $240,000,000. Next came war with Russia. In 1904 the debt amounted to nearly $270,000,000. In 1905 it reached $484,000,000, and in 1906, nearly $925,000,000. The close of the war with Russia did not mark the end of this extraordinary increase, however. The debt has steadily mounted, until at the present time it is given as approximately $1,325,000,000. The present debt of the United States is $1,028,564,000. The comparison is unfavorable for Japan, though allowance must be made for the extensive State, county and municipal indebtedness of the United States. In Japan a large proportion of the public indebtedness of this character is included in the national debt.

These figures suggest very clearly a condition calling for considerable caution on the part of those who have charge of the fiscal affairs of Japan; and, in fact, the preparation and discussion of the annual budget are the most serious occupation of Japanese statesmen. The agricultural community, through self-sacrifice and skill, has indeed produced a high return upon the limited acreage of the Empire; but it is stated in authoritative quarters that the Japanese farmer can bear no further increases of taxation. On the contrary, it is suggested that there is a tendency observable on his part to demand a higher standard of living for himself and his family, only possible if the burdens imposed upon him are lessened. This tendency is even more strongly manifested in the industrial communities, where contact with Western civilization has been closer. The average Japanese laborer, with a family of three, is reported to subsist on $10 a month at the present time,—$2.50 going for rent, $5.25 for food, 75 cents for fuel, and $1.25 for other living expenses. Of the $5.25 spent for food, $3 goes for rice. The price of this staple is constantly rising; and with the withdrawal of farmers to meet the growing demands of the industrial communities it is probable that it will increase still further.

The present time appears to be notable for the transition which is taking place in Japan from agricultural to industrial pursuits. The chief contrast between the present import and export of goods and the foreign trade of thirty years ago lies in the growth of exports of manufactured goods, and of imports of raw materials. In 1892, for example, exports of goods manufactured and partly manufactured amounted to a value of approximately $31,000,000, and in 1911 they amounted to over $175,000,000. Imports of raw materials reached a value of less than $7,500,000 in 1892, and in 1911 amounted to more than $115,500,000. Of this latter value raw cotton accounted for approximately $100,000,000.

One of the most interesting considerations which arise in the study of Japan's industrial growth is that of the supply and cost of labor. It is popularly supposed that the abundance and low cost of Japanese labor renders Western industrial competition with Japan almost out of the question. It has less frequently been observed that this supposition holds good only in case the producing power of the labor unit in Japan is proportionately as great as that in the West. On this point Mr. J. D. Whelpley, the well-known writer on industry and trade, has made the following observation: "Many employers are already convinced that even with the wage scale as it is, Japanese labor is as well paid as that of England, Germany or the United States." Mr. Whelpley has pointed out, further, that the quality of the output which affords the bulk of the value of Japanese exports is such as to appeal chiefly to Oriental customers. This writer is of the opinion that the future of Japanese industrial and commercial growth lies in the trade with China; and in support of this view he quotes a highly suggestive passage from a recent statement of Baron Makino, formerly Minister of Agriculture and Commerce. The statement bears so strongly upon the commercial possibilities both of China and of Japan, that it may well be qouted here, in part. Baron Makino says:

"China has people, and population is what makes trade. No other country in the world offers so vast a field for trade. With the growth of education and the development of material progress possibilities of commercial enterprise in China are simply unlimited. The anxiety of the Powers to enter into more and more intimate trade and political relations with China cannot but excite intense interest in Japan; for China is our nearest neighbor, our best customer; and our commercial and political relations with that country are superior to that of any other nation. It is therefore a matter of infinite importance what course China takes in dealing with the numerous applicants for her patronage at this or any other time.

"It is true that Japan enjoys a profitable trade with many countries in the West. Our exports to America are of increasing volume and value; while the various nations of Europe welcome

what we can supply; but this Occidental trade is at its best difficult for us to handle with any satisfactory degree of achievement; for it is always more difficult to deal with highly developed commercial nations than with those less advanced in modern progress. Trade with peoples of lower social standards is always easier and more profitable. There was a time when Japan hoped to find her chief field of commercial enterprise in the West; but to-day the mind of Japan is all toward China as the commercial hope of our future, not to say anything of our geographical and racial advantages in that country.

"It is our ambition to be to the East what Great Britain is to the West. We have left no means untried in making a thorough investigation of the present conditions in China, so as to arrive at as accurate an estimate as possible of what is to be expected in the relations of that country with Japan in the future. The data obtained is vast and will require a great deal of consideration. * * * Another matter of no small importance is as to how our trade with China may best be promoted. Hitherto we have done a great deal of it through foreigners, that is, through *habau*, or middlemen; but, as every one knows, the more hands a transaction has to go through the more complicated and expensive does it become. * * * In the matter of direct trade with China, the merchants of Japan enjoy a considerable advantage, as they are more familiar with the language and customs of China than are their foreign contemporaries. * * *

"We think we know a great deal about commercial conditions in China, because we know a little more than the merchants of the West; but we really know nothing as we ought to; and I would advise all those who hope to share in trade with China to make careful and constant investigation into the conditions prevailing there. Instead of our business men staying at home and waiting for orders, let them go or send representatives into central China, and they will find a more remunerative field of demand and consumption than they ever dreamed of reclining in their offices at home. * * * Now is the time to explore China commercially; and any demand we create now for useful articles will in all likelihood become permanent. * * *

"It is not too much to say that a great part of our hope for future financial rehabilitation in Japan depends upon how we can further develop trade in China. In this matter we cannot afford to be beaten by our foreign competitors; for the very welfare of our nation depends upon it. I would have all Japanese regard it as the foundation of our national prosperity. Should we lose China as a customer it would mean the ruin of our commercial prospects."

In view of this strong statement it is not a little surprising, at first glance, to find that only 30 per cent of Japanese exports and 16 per cent of Japanese imports are accounted for in the country's annual exchange with China. The percentage of exports to the United States is 34; that to France 8, and that to Great Britain 6. Of imports, 21 per cent originate in Great Britain, 19 per cent in India, 15 per cent in the United States, and 11 per cent in Germany. It is important to note, however, that the Japanese exports of raw silk conform to this proportionate distribution. China, itself a silk raising country, is naturally not a customer of Japan in respect to this commodity. The value of Japanese exports of raw silk in 1913 was $91,142,682, or approximately 30 per cent of the entire export value for the year. Of this total the United States took the value of $57,162,420. Obviously, the Western market is the chief one for the product raised. But the market for Japanese cotton yarns and cloths lies in the Far East; and the growth of this branch of industry in Japan may be seen in the figures for the past two years. Exports of cotton yarns increased from a value of less than $27,000,000 in 1912 to a value of over $35,600,000 in 1913; while cotton cloths exported increased in value from nearly $13,000,000 in 1912 to nearly $17,000,000 in 1913. The principal imports and exports of Japan in 1913 will be seen in the following table:

CHIEF JAPANESE IMPORTS AND EXPORTS, 1913.*

	Imports. Yen.†		Exports. Yen.
Raw cotton	233,599,185	Raw silk	188,884,182
Rice	48,472,446	Cotton yarn	70,997,538
Oil cake	39,418,165	Silk manufactures	34,882,279
Sugar	36,762,302	Cotton cloths	33,557,999
Machinery	34,358,844	Copper	28,183,904
Iron bar, rods, plates	33,288,861	Coal	23,670,866
Wool	15,998,140	Refined sugar	15,831,330
Wheat	12,351,020	Straw braid	15,692,045
Soya beans	10,388,487	Matches	11,864,514
Woolen cloth	10,501,803	Silk waste	10,465,427
Woolen yarn	10,091,604	Tea	10,077,421

*Including re-imports and re-exports. †Yen equals $0.49.

On the basis of her foreign commerce in commodities the trade balance against Japan amounted to nearly $50,000,000 in 1913. Reference has been made to the heavy tax rate and the large national debt. Viewing these facts in the light of the remarks of Baron Makino, which have been quoted above, explanation is hardly required of the anti-imperialist riots in Tokyo in February, 1913; or of the fact that Japan has been driven to the expedient of borrowing money abroad to pay the interest on previously contracted loans; or of the announcement, made a month ago, that no new battleships would be laid down during the ensuing fiscal year,—in order to refute the suggestions of those who would endeavor to view Japan apart from its proper Oriental setting. Without detracting in the least from the splendid development by the Japanese of the resources at their command, it would appear to be a reasonable course, while co-operating with them in a spirit of highest good will and as fully as the economic forces of trade will permit, at the same time to accept the opinion of their Minister of Agriculture and Commerce that the manifest destiny of Japan does not lie beyond the confines of the Far East.

A CONTRIBUTION TOWARDS A BETTER UNDERSTANDING OF LOW GRADE COTTONS

By Michael A. Agelasto.

IN 1898, my father, now dead, who was the general agent for the cotton firm of Ralli Brothers of New York City and London suggested to me the possibility of redeeming spinnable cotton fibre from the various standard low grades of cotton, from unstandardized cottons, and from cotton waste found at all gin centers and points where cotton in bales is concentrated. Knowing of the misunderstandings that so often arise in the purchase of low grade cotton, by reason of the ignorance in the cotton trade of the spinnable value of these cottons as compared with standard grades; knowing the impossibility of the grader, however expert, determining the spinnable value of these cottons, owing to his being unfamiliar with the ever-varying qualities of low cotton; knowing it to be impossible for a probable purchaser of these low grades to obtain from a disinterested source their true value as compared with standard grades,—I became interested in the solution of the problem. I conceived the idea of mixing these various cottons, cleaning them and extracting the spinnable fibre, with the hope of placing on the market one grade whose spinnable value could be known by the trade. From that time all my energy was directed to the study of all grades of cotton fibre and the development of a process by which I could accomplish the desired results. After a series of experiments I was convinced that I had found a possible solution. In this idea I

was encouraged by my father and also by the late George W. Neville, who was at that time connected with the cotton firm of Messrs. S. M. Weld & Co. of New York and Boston. From that idea developed the Atlantic Manufacturing Company of Norfolk, Va., which was incorporated for the business of re-ginning cottons. The mill of this company, under my management, has in the past eight years tested and re-ginned almost every variety of American cotton,—the various Texas, Mississippi, Alabama, Oklahoma cottons; Sea Island cottons from Charleston; a small quantity of Egyptian and Indian cotton; short staple, heavy-bodied cotton; also various kinds of spinnable wastes. The process is very simple. It is the cleaning of all foreign matter from the standardized and un-standardized cottons; the testing as to loss in weight, and as to length, strength and color of fibre; the testing of the nature of the fibre; and, lastly, the mixing and re-ginning of the cleaned stock by a particular method. I mention this process because experience has taught me that there can never be a true understanding by the trade of the value of low cottons without bearing in mind the lessons taught in the process of re-ginning.

The experience so gained in re-ginning reveals and emphasizes the following:

1.—The fact of the amazing ignorance in the cotton trade of the value of low cottons.

2.—That it is this ignorance at bottom which is the cause of the very lax methods,—lax in every sense of the word,—that permeate the commerce in low grade cottons and constitute so great a hardship to the grower of cotton who happens to be confronted with a low grade crop; to the merchant who wishes to do a legitimate business in cotton, and to the spinner of low cottons. It is this ignorance which causes most of our low cotton to find its way to foreign markets, particularly to Germany, where, owing to more scientific study of the manufacturing value of these grades, their value is better known.

3.—The fact that the greater mass of low cottons not only varies from year to year, as to color, length and strength of staple and amount of foreign matter due to natural causes, but also varies from artificial causes, namely, the yearly variations and improvements of the ginning processes, which are designed to recover fibre that in the past has been wasted. This variation in a very large portion of low cottons has not heretofore been sufficiently emphasized.

4.—The fact that the value of these low cottons depends not only on the color, strength, length and character of fibre and on the amount of foreign matter contained in the cotton, but also on the form in which the fibre is left after ginning.

5.—The fact that gradually every year more and more low cottons are passed through gins with the object of putting on the market a cleaner, more uniform stock,—the fact being overlooked that many of these stocks are being over-ginned, in fact almost "machined," and in so far approaching waste.

6.—The fact that, owing to the many natural and artificial variations found in low cottons, there cannot be a true understanding of their value without familiarity with the characteristics of over-ginned cottons, of re-ginned cottons, and, lastly, of various wastes. Regular cottons as they fall in grade and character may be regarded, for convenience, as gradually merging in character, first, into over-ginned cottons, then into re-ginned cottons, and lastly into cotton-mill wastes. Ignorance of the character of these various low cottons on the part of supposed expert graders is very clearly shown by the frequent rejections on future deliveries in New York of regular ginned cottons, on the plea that they are re-ginned cottons.

7.—The fact that there will always be a point where the expert grader will fail to give a true value to the various low cottons, not only because of his want of familiarity with the varying varieties of these cottons, but also because of the impossibility, particularly where the grade is not familiar, of avoiding the entry of the personal equation as a determining factor.

8.—The fact that there can never be a true settlement of the value of low cottons unless through expert grading and standardizing there be devised some way by which these cottons can be compared in a scientific manner with a scientifically determined standard.

9.—The fact that, as soon as the trade feels that there is a disinterested source from which definite information may be obtained about the value of any particular cotton as compared with the standard, there will very soon follow that knowledge the lack of which now creates the difficulties which beset the trade.

I have described some of the various facts which the process of re-ginning reveals and I have stated various difficulties in connection with the solution of the problem. These difficulties must be faced clearly and distinctly, without shirking one of them, if in the future we intend not to be confused and misled by them. What, then, is the path to follow that experience in the process of re-ginning offers for the possible solution of these difficulties? I have already suggested the solution. It is the establishment of a laboratory in connection with some experimental station, in which a scientifically determined standard can be made. This absolute standard may be one particular grade; or, if advisable, there may be a number of standards of the same grade, varying according to the cotton-growing sections of the United States. This absolute standard must be obtained by scientifically determining the length, strength and color of the fibre, the microscopic character of the fibre, the chemical analysis, the amount of foreign matter present, and the amount of moisture. With this absolute standard, cotton whose value is at issue could be, as a last resort, scientifically determined. Inherent in this plan is the necessity of a careful collection being made of every cotton, however rarely it may appear on the market,—these cottons to be scientifically compared with the standard and placed on record. Very soon a scientifically tested collection of samples of all ginned cottons, however rare, would exist, making it very easy to give at any time to any one the value of a cotton sample submitted. Should such a laboratory be established, many more interesting facts about the comparative value of low cottons would be revealed, making more clear to the grower of cotton the requirements of the spinner, and to the spinner the difficulties and discouragements of the grower.

To equip a laboratory of this kind in connection with an experimental station would require only a nominal monetary outlay for apparatus. The experience of testing in the reginning process shows that the physical tests are simple and require little time and not necessarily highly expert labor.

This then is the contribution which my experience in ginning cottons enables me to offer for the better understanding of low cottons. The above facts cannot be overlooked whatever method may be adopted, for the solution of a question whose reality is shown by every low grade crop raised in the United States. If we are to solve any of the more serious problems of industry and compete successfully among struggling peoples we must face every issue from a strictly scientific standpoint.

In conclusion, I need not mention the unfortunate ignorance that exists as to the true market value of low cottons,—an ignorance that beckons the parasitic, unscrupulous trader to a lucrative field; nor the great discouragement, in the form of that

unscrupulous trader, that faces him who innocently enters this field in the hope of doing a legitimate business. Nor need I mention the care with which reliable firms avoid dealing in low cottons, unless they be bought at a sacrifice, nor emphasize the general truth that ignorance is economic waste and that such ignorance need not exist.

INDUSTRY, COMMERCE AND FINANCE

Canadian Foreign Trade for the Fiscal Year, 1913-1914.—The annual report just issued by the Department of Customs gives the grand aggregate of Canadian trade, according to revised figures, as $1,129,744,725 for the fiscal year ended March 31, 1914. The exports amounted to $478,997,928 and the imports to $650,746,797. Of these imports, $633,092,449 were entered for consumption, and of those entered for consumption $410,258,744 were dutiable goods. The customs revenue of the Dominion amounted to $107,180,578, or 16.91 per cent on the total imports and over 26 per cent on dutiable imports.

The exports of Canadian production were classified as follows:

Classes.	Value.	Classes.	Value.
The mines	$59,039,054	Miscellaneous	$121,088
The fisheries	20,623,560	Coin	1,219
The forest	42,792,137	Exports not the produce of Canada	47,408,270
Animals, their produce	53,349,119		
Agricultural products	198,220,029		
Manufactures	57,443,452	Total	$478,997,928

The destination of the exports was as follows:

Countries.	Value.	Countries.	Value.
Great Britain	$222,322,292	Germany	$4,443,736
Other parts of British Empire	23,709,829	Netherlands	5,508,806
United States	176,948,299	Japan	1,589,067
Argentina	2,135,273	Russia, European	1,370,093
Belgium	4,819,843	All other countries	6,950,903
Cuba	1,828,521	Coin exported	23,560,704
France	3,810,562	Total	$478,997,928

The following table gives the value of the dutiable and free imports from the principal foreign countries:

Countries.	Imports.	Countries.	Imports.
Dutiable.		Free.	
Great Britain	$103,000,590	Great Britain	$29,821,154
Other parts of British Empire	10,089,880	Other parts of British Empire	13,146,793
United States	262,[illegible],220	United States	162,806,783
Austria Hungary	[illegible]03,382	Argentina	2,577,236
Belgium	2,978,570	Belgium	1,512,874
Cuba	3,362,993	Brazil	1,161,415
France	12,013,000	France	2,360,367
Germany	[illegible]	Germany	3,500,871
Netherlands	[illegible]	Netherlands	1,537,437
Italy	[illegible]	Japan	1,140,246
Japan	[illegible]	Mexico	1,433,724
Dominican Republic	[illegible]	Other countries	4,414,221
Switzerland	[illegible]		
Other countries	[illegible]		
Total	[illegible]		$22[illegible],221

The Production of Precious Stones in the United States.—The gem industry of the United States in 1913 was marked by a fairly large output of sapphire, a real advance in the work of testing the Arkansas diamond field, and a promise of life in the Nevada opal field. There was, however, a decrease in the production of most of the other gems mined. The total production was valued at $319,454, according to D. B. Sterrett, of the United States Geological Survey. The output of sapphire in Montana was the largest ever reported to the Survey, and the value is estimated at $238,635, or over $43,000 more than in 1912. The sapphire consisted of both blue and varicolored gems and culls for mechanical purposes. In Arkansas one diamond-washing plant was in operation about three months and recovered several hundred diamonds, and the construction of another plant was practically completed. Many new claims were located in the Nevada opal field, the development of which, along with those previously opened, resulted in a fairly large output of beautiful gems.

The imports of precious stones for 1913 were valued at $45,431,998 and were the largest in the history of the industry.

* * *

Pauperism in England as Affected by the War.—"Distress due to the war has added appreciably to the volume of pauperism in England and Wales," says "The Insurance Observer," of London, "but not to anything like the extent that might have been anticipated. Statistics for the third quarter of the year, issued by the Local Government Board, show that the number of persons in receipt of relief rose from 618,685 on August 1 to 650,737 on August 22, an increase of 32,052.

"It is, however, pointed out that the recipients of relief in that month included a number of dependents of soldiers and sailors, and that in those cases in which the cost is recouped from the National Relief Fund, it is contemplated that the names of the recipients should be erased from the records kept by the guardians. Accordingly the totals of pauperism at present on record for certain weeks in August are subject to some reduction.

"After August 22 the aggregate number of persons in receipt of relief declined week by week, and on September 26 it amounted to 641,028 (or 17.2 per 1,000 of the population), as compared with 611,448 (or 16.6 per 1,000 of the population) on the corresponding day in 1913. The increase between June 27 and September 26 amounted to 22,713, or 3.7 per cent, compared with a decrease of 2,032, or 0.3 per cent, in the corresponding period of the previous year.

"Below are the figures, relating to London and the whole of England and Wales, respectively, for the end of September in each of the last four years":

	Number of Paupers.		Ratio per 1,000 Inhabit'ts.	
	London.	England and Wales.	London.	England and Wales.
1911	105,126	642,752	23.3	17.8
1912	104,388	636,343	23.1	17.4
1913	98,943	611,448	21.9	16.0
1914	104,269	641,028	23.1	17.2

* * *

Irish Vital Statistics for 1913.—According to the "Insurance Observer" of London, the annual report of the Registrar-General for Ireland states that the number of marriages registered during 1913 amounted to 22,266. The number of births for the same year was 100,094, and deaths 74,694. It is much to be desired, says the report, that the custom of omitting the ages in the certificates of marriages be discontinued, as a complete record of the ages of the persons married would be valuable; and it is regrettable that this information is not contained in the records in the majority of the entries. The report further states that in Ireland the percentage of persons married who were under age is very far below the corresponding percentages in England and Scotland. According to the returns the number of emigrants (natives of Ireland) who left the ports of Ireland during 1913 was 30,967, of whom 16,452 were males and 14,515 females.

INSURANCE

PERHAPS no feature of the legislation about life insurance companies which resulted from the so-called Armstrong investigation in the State of New York met with more general approval at the time than the restriction of the companies' investments in securities to bonds and the exclusion of stocks. The quintessence of financial wisdom was assumed to be embodied in this provision, through which the managers of the companies were expected to be kept far away from everything savoring of speculation with the funds of the policyholders. No one appears even to have suggested that the rigidity of an imperative statute might in the course of time be found so to have tied the hands of those responsible for the financial affairs of the companies that they could not ward off a threatened harm to the companies, and hence to the policyholders, which might arise from a change in the investment status of bonds, as compared with stocks. To-day, however, it is apparent to every one who looks beneath the surface of the stream of world finance that perhaps as serious a problem as ever has had to be dealt with by the managers of life insurance companies, and by public authority in this connection as well, is the tremendous modification of the capital value of fixed-rate, long term investments of the character of bonds,—a modification already under way well before the outbreak of the European War and destined, as a result of that war, to become far more pronounced in the coming years. The interest rate is irresistibly rising, to the disadvantage of the market value of capital already invested at fixed rates in earlier years, and for the owners of this already invested capital there is absolutely no way of escape from the shrinkage, until the slow round of the years shall have gradually brought their old investments to maturity. As regards the profits of business enterprises, however, whose division is represented by the stocks of those enterprises, it is a well known economic fact that these tend always to conform themselves to the current rate of interest. They rise with the rise of the interest rate and they fall with its decline. Hence, in the long run the market value of stocks, at least of sound enterprises, is far less exposed than is that of bonds to depreciation by reason of a rising interest rate. Thus it may safely be predicted at this moment that as soon as the financial readjustments consequent upon the war are completed, the huge loans of the belligerent nations floated and the resultant world interest rate brought to a comparative equilibrium, the average profits of conservative business will speedily conform themselves to that rate (due allowance being made for the element of business risk), and the division of these profits among holders of stocks will be at such a rate of return that the market prices of the stocks will not only not decline below the present low levels of uncertainty and distrust, but will actually advance to levels as high as ever. Existing bonds, on the other hand, must follow a totally different course, declining in market price, irrespective of the prices of stocks, until the rate of return upon them is on a parity with the new high interest rate, whatever that may prove to be. It is obvious, therefore, with what a sense of almost hopeless desperation the officers of life insurance companies who have been compelled to follow the iron-clad provisions of the New York law in making investments will during the next few years have to sit by and watch the market value of the bulk of their securities shrink, with virtually no compensating gains in other directions. It is not that the validity of their contracts will be impaired, for even the oldest investments in bonds will still yield more than the rate of interest assumed in those contracts. But every wise and conservative business man is distressed if the present market worth of his assets is insufficient to make his balance-sheet show a surplus over the liabilities which he conceivably may be called upon to liquidate at once in cash.

It is a very clear illustration of the financial unwisdom of a hard and fast rule, embodied in a virtually unchangeable statute, with regard to the forms of investment open to insurance companies that the New York authorities despite the model Armstrong law, have already been compelled to admit of two considerable accommodations of the book-values of bonds to the necessities of annual balance-sheets. The first and the more easily defensible of these accommodations was, of course, the permission granted by an Act of the Legislature to the life insurance companies to use amortization values of bonds, instead of market values, in ascertaining the worth of their assets. Far more dubious, and indeed fraught with the most dangerous possibilities, is the decision arrived at by the Convention of Insurance Commissioners, and accepted by the Insurance Commissioner of New York to permit insurance companies, other than life companies, to take the market quotations of June 30, (a month before the outbreak of the war), as the basis of valuation of their securities in making up their annual statements, as of December 31, 1914. The difficulty with both these expedients is that they permit a disparity to exist between the value of the assets of insurance companies, as set forth in their balance-sheets, and the true market value of the same. According to all the criteria of prudent business, therefore, the resultant balance-sheets are false and misleading.

It is to be supposed that when the way was first opened to insurance companies to base the valuations of their securities upon something else than the market prices existing at the approximate date of the balance-sheets, no one conceived that wide and long-continued disparities could exist between the worth of assets so valued and their usual market worth. It is hardly conceivable that the Legislature of New York would ever have consented to a method of valuation that might produce a disparity of ten, fifteen or twenty per cent. And yet it is now almost certain that a consequence of the war in Europe may be precisely such a distortion of the real facts of the assets of life insurance companies, supposing the amortization basis of valuation to be persisted in. If such a result comes about, there is no avoiding the conclusion that there will be great and steadily increasing embarrassment both for the officers of New York life insurance companies and for the insurance authorities of the State. The truth is now being made manifest that from an economic point of view, the investment restrictions of the Armstrong legislation are wrong. A sound theory of investments for fiduciary institutions implies that provision should be made for the fundamental and irresistible changes in market values produced by slow or violent movements of the supply, the demand and the market price of capital. Shocks of the most disconcerting kind are sure to come with the passage of the years; and there must be shock absorbers. Whatever theoretic arguments may be adduced in support of a method of investment and of valuation of investments which opens the possibility of a wide disparity between balance-sheet worth and real market worth, practical business judgment is revolted and made uneasy when the full effects of such a method are perceived. Thus, to-day, the life insurance companies of New York would be vastly better off than they are if a full third of their investments consisted of stocks instead of bonds. If another third were in short-term fixed investments, like mortgages, they would be still better off. Their long-term, fixed-rate bonds ought not to be more than one-third of their invested assets. Were this their situation, they could look on with complacency as the rising interest rate depreciates the market value of their old bonds, because their fresh purchases of new, high-rate bonds would be continually bettering their position; and still they would have no explanations to make about the validity of their published annual statements.

THE EXTRA-TERRITORIAL EFFECT OF THE CONNECTICUT WORKMEN'S COMPENSATION ACT

By Harry B. Bradbury.

THE Connecticut Workmen's Compensation Act is held to apply to accidental injuries or death occurring in another State of the Union, or in a foreign country, in two well-considered decisions of different Compensation Commissioners of Connecticut, which were handed down recently.

In both of these cases the employer and the employe were residents of Connecticut and the contract of employment was made in Connecticut. In both cases also it was contemplated when the contract of employment was made that the employes would be employed out of the State a part of the time at least.

George Marsdale was employed by the Thames Towboat Company of New London, Connecticut, and was sent by the company on a tug to Raritan Bay, South Amboy, in the State of New Jersey. The tug met with an accident and foundered. Some of the men climbed to the top of the pilot house and were saved. Marsdale, in the excitement, jumped overboard, apparently in an attempt to save himself, and was drowned. A number of questions were raised, but the most important one was in relation to the extra-territorial force of the statute. Dr. James J. Donohue, the Compensation Commissioner of the Second Congressional District, handed down the decision overruling all of the objections, in which he discussed the question of the extra-territorial effect of the statute at some length. The portion of the decision relating to this point was as follows:

"The claim was made also by the respondent that the Compensation Act of Connecticut has no extra-territorial force. In substantiating their claim they cite the case of American Mutual Liability Insurance Company (Mass.) 102 N. E. Rep. 693.

"Cases of later decision and more nearly in point would be New Jersey case of Deeny v. Wright & Cobb Lighterage Co., 36 N. J. Law J. 121; also McDonald v. Mallory, 77 N. Y. 546.

"In Mr. Bradbury's Workmen's Compensation, Vol. 1, 2d Ed. page 51, he has changed his views upon the question of extra-territorial force of Workmen's Compensation Laws and, to use his own words:

"' . . . He believes that the opinion expressed by Mr. Justice Martin in Deeny v. Wright & Cobb Lighterage Company case is more in conformity with the spirit and the necessities of the development of the compensation principle in the American States. This is especially true as to elective laws and to prevent difficulty the same principle should be incorporated in every compulsory statute.'

"For further discussion of the extra-territorial question I would respectfully refer to Bradbury's Workmen's Compensation Act, 2d Ed. Vol. 1, page 34 et.

"In the Deeny v. Wright & Cobb Lighterage Company case, the Court says:

"'It appears that [illegible] contract to compensate for injuries arising out of and in the course of the employment, and under it all other methods and legal remedies for form of compensation are relinquished. The statute can have no extra-territorial effect, but it does require a contract to be made by two parties to a hiring that the contract shall have extra-territorial effect.'

And continuing, it says:

"'The cause of action of petitioner is ex contractu. The lex loci contractus governs the construction of the contract and determines the legal obligations arising from it.'

"According to the ruling in the Schweitzer v. Hamburg American Line case 3, Bradbury's Pl. & Pr. Rep. 285; 78 Misc. 448; 138 Supp. 944, if this action were brought anywhere other than in the State of Connecticut, it would appear that the case would be returned to the place where the contract of employment was made.

"In the McDonald v. Mallory case, Bradbury's 2nd Ed. Vol. 1, page 45, the Court held that under the doctrine of Crapo v. Kelley, 16 Wall. 610,

"'Civil rights of action for matters occurring at sea on board of a vessel belonging to one of the States of the Union must depend upon the laws of the State, * * * * and that to this extent the vessel must be regarded as a part of the territory of the State'

"The Compensation Acts of the State of New Jersey and the State of Connecticut are very similar on the question of contract of employment, and the foundation of the principle of compensation seems to be based on contract, and great weight should be given to the decision of the New Jersey Supreme Court, especially in the Deery v. Wright & Cobb Lighterage Company case; and under the Connecticut Act, when an employer and employee agree to accept its provisions, it is understood to include the mutual renunciation and waiver of all rights and claims arising out of injuries sustained in the course of employment, except in the manner provided by the Act.

"In view of the attitude of various States on the extra-territorial question, Bradbury in commenting on this particular case says: 'The author cannot help but express a feeling of regret that its (the Court's) decision in Gould v. Sturtevant was not the other way.'

"The respondent's attorneys make the claim that the employee who has received an injury shall submit himself on request to an examination by a reputable practicing physician, and then they attempt to conclude by stating that a reputable practicing physician must mean one practicing under the laws of the State of Connecticut. There is no reason to conclude but what a reputable practicing physician of any State can make the examination in question.

"Other features of the Act are commented upon by the respondent, as the filing of the agreement in the office of the Clerk of the Superior Court for the county in which the injury occurred, and that an appeal from the Commissioner to the Court can only be had in the county in which the injury is sustained. It would seem that the above provisions of the law should be considered as directory and not mandatory. See Spencer's Appeal, 78 Conn. 303.

"Under the Workmen's Compensation Law a new method of procedure is introduced. In a case of this kind, under the common law the estate of the deceased would bring the claim, while under the Compensation Law the rights of the deceased would pass on to the dependents, who, as representatives or agents of the deceased, can assume the same method of procedure as the deceased would have in case he were living and made a claim for non-fatal injury."

The other case was decided by Hon. Frederic M. Williams, Compensation Commissioner of the Fifth Congressional District. In this case F. P. Welton, who was a resident of Waterbury, Connecticut was employed by the Waterbury Rolling Mill Co., a Connecticut corporation, as traveling representative, and he also had supervision of one of the departments of the company. Mr. Welton was also a stockholder and one of the directors of the company and its treasurer. He did not receive any salary as director or treasurer. While Mr. Welton was in Hamilton, Ontario, in the Dominion of Canada, traveling on the business of the company, he was injured. In Mr. Welton's case also a number of interest-

ing questions were raised, but the most important one was in relation to the extra-territorial force of the statute. On this point Commissioner Williams stated:

"The other claim of the insurer is much more difficult to decide. The court of appeal in England in the case of Tomalin v. S. Pierson & Son, Ltd., 2d Butterworth Workmen's Compensation Cases, p. 1, decided that their Workmen's Compensation Act had no extra-territorial force outside of the confines of the United Kingdom. In that case a contract was made between the husband of the claimant and the respondent, a well known firm of contractors, whereby the decedent went to Malta for the purpose of assisting in the building of a breakwater. The Master of the Rolls in deciding this case rests his decision on the fact that no contractual relation existed between the widow of the deceased and his employer, that her only claim against the respondent was for a statutory duty arising independent of the contract. He says on page 4 of the opinion: 'She is claiming not as a party to a contract, not claiming any rights under a contract made by her or by any person through whom she claims; she is claiming simply the performance by the employer of a statutory duty, which statutory duty is said to be found in the Workmen's Compensation Act of 1906.'

"In Gould's case, 215 Mass., page 480, the Supreme Court of Massachusetts held that their Workmen's Compensation Act had no extra-territorial force, but it is to be borne in mind that their Act differs from ours in many important particulars. As Chief Justice Rugg says in his opinion, on page 482, 'the compensation is to be paid not directly by the employer, but by the insurer, who is either the Massachusetts Employees' Insurance Association created by Part 4 of this Act or any liability insurance company authorized to do business within the Commonwealth. The employe has no immediate relation with the insurer. He is the beneficiary under a contract between the employer and the insurer.'

"It is true that a large number of reasons given by Chief Justice Rugg in his learned and elaborate opinion why he deems that the Legislature of Massachusetts did not intend their statute to have an extra-territorial effect would apply here; thus we have a provision about examination by a physician, we have a provision about holding hearings where practicable in the place where the injured employe resides, and we have a provision more important than all others whereby the award of a Commissioner receives its sanction solely through its enforceability by the Superior Court, and this is coupled with a provision that the award shall be filed in the office of the Clerk of the Superior Court in the county in which the injury took place.

"However, the main reason on which the Massachusetts court rests this decision is the same reason as that on which the British Judge rests his, namely, the lack of a contract between the parties before him. The Connecticut law does not leave the parties to this action without definite contractual status. It is expressly provided in §1 and §2 of Part B that this Act shall be a part of every contract of employment made before the date thereof and continued in force after its date, and of every contract originally made after the date of this Act, so that if it were possible to bring a suit on this statute it would not be an action ex-delicto, but plainly an action ex-contractu. Hence the general principle of the law that penal statutes have no application outside of the State of their enactment has no application here.

"This is not a penal statute, but a remedial statute, and the parties who have accepted its terms have made the statute a part of their contractual relations.

"Mr. Bradbury in his treatise on Workmen's Compensation Law, 2d. Ed., beginning at page 34, discusses the extra-territorial effect of compensation statutes at considerable length, and while compelled to conclude that the law is in doubt, expressed very strongly the opinion that too much attention has been given to the effect of British decisions and too little to the theory of contracts, especially in those States like Connecticut where the Compensation Act is expressly an amendment of contracts of parties.

"The effect of decisions like Loomis v. R. R., 208 N. Y. 312, and as it seems to me the effect of the Gould case, are very largely overcome by the principle laid down by the United States Supreme Court in Tennessee Coal and Iron Company vs. George, 233 U. S. 354.

"This decision is later by a considerable time than any of the other cases referred to, and it seems to me ought to have a controlling effect on the decision of the case at bar. This leaves the principal difficulty to be considered as to whether in the case of Connecticut contract between Connecticut citizens, a man who while in the course of his employment sustains an injury arising out of his employment while within a foreign State should be denied the equal protection of the laws, because although it is practicable to hold the hearing in the town where he lives, a literal compliance with the statute as to filing an award in the office of the Clerk of the Superior Court in the county where the injury took place cannot be complied with.

"Manifestly it would be a purely nugatory act for a Connecticut Compensation Commissioner to file a copy of an award in any court outside of Connecticut.

"It seems clear to me that the whole spirit and purpose of our Act ought not to be set at naught because of this difficulty.

"Section 25 of the Act in question provides in substance that a Commissioner enforcing it shall proceed so far as possible in accordance with the rules of equity and in such a manner as is best calculated to ascertain the substantial rights of the parties and carry out justly the spirit of this Act. For the reasons indicated above it seems to me that to refuse the claimant compensation in this case would be directly contrary to the entire spirit of this statute. Such a decision would rest on a narrow and technical interpretation of one clause as to where the award is to be filed. I believe it is proper to regard the provisions of the clause above referred to as to filing a copy of the award with the Clerk of the Superior Court in the county where the injury took place as directory and not mandatory in accordance with the legal principles laid down in Spencer's Appeal, 78 Conn. 303."

THE WORK OF AMERICAN RAILROADS IN FIRE PREVENTION

THERE is given below an account of the second annual convention of the Railway Fire Protective Association, as published in the "Railway Age Gazette," which is interesting as showing the effective work being done by American railroads in the prevention of fires.

* * *

The second annual convention of the Railway Fire Protection Association was held at the Hotel Raleigh, Washington, D. C., on October 6 and 7. The meeting was called to order by President F. H. Elmore, superintendent of insurance of the Southern Railway. In his address, the president called attention to the preliminary work to which the association's first year had been devoted and noted that the real work of the society, to prescribe the methods of fire protection, had hardly been begun. He emphasized the necessity of co-operation, first, on the part of members in their relations with the various committees, and, second, on the

part of the society towards the operating department, expressing the opinion that once the interest and support of the operating officer were secured, accomplishment would be assured. The real work of the society, therefore, he said, lies in devising practical, economic and effective ways and means for the protection of and the prevention of loss to property. Its province is to develop standard practices and to play the part in the railway field that the National Fire Protection Association plays in industry in general; it must prove to the operating officer and to the latter association that it is the authority in its branch of the subject.

The report of the executive committee showed that the society had increased its membership approximately 57 per cent, and recommended the establishment of a number of new committees.

The Committee on Fire Hazards, Charles N. Rambo (Norfolk & Western), chairman, presented a report, from which the following is abstracted:

The Committee on Fire Hazards has not attempted to ascertain the causes of fire, but rather to consider some of the common hazards that exist and to prepare standards for correction or elimination. It has put its recommendations in the form of bulletins of the Committee on Fire Hazards and proposes that they be improved upon, if necessary, and adopted as standards, possibly in the form of a "Manual" or "General Code" on fire prevention. During the year the committee has prepared six bulletins.

Bulletin No. 1 giving general recommendation for the prevention of fire losses, deals primarily with buildings and is sub-divided into four sections: Construction, Care of Property, Lighting, Heating and Power.

Bulletin No. 2 relates to the hazard of locomotive sparks. The members of the committee, without exception, believe one of the greatest hazards to contend with in connection with railroad risk is that of the spark hazard, and it has, therefore, through a sub-committee, gone into the subject very minutely. The bulletin aims primarily toward the elimination of the hazard and invites uniformity of action in connection with the proposed maintenance safeguards. The bulletin is given herewith almost in full:

The hazard of locomotive sparks and the consequent fire damage to railroad and other property has received special study by the railroads and insurance companies.

It seems to us that this subject having been given such careful thought and attention by the departments of railroads vitally interested, is one in relation to which your committee should consider positive means of eradication of the hazard, rather than some of the auxiliary methods that have been pursued to lessen the result of the hazard. By the former is meant that the principal place to offset this hazard is in the roundhouse and shops in keeping the screens, fittings, flues and appliances, ash pans and dampers up to the standard as set forth in the bulletins of most railroads. By the latter we mean consideration in construction of buildings, such as has been undertaken in the past through the substitution of a better class of roof coverings, the avoidance of unnecessary pockets in roofs for the accumulation of sparks, etc., the cutting of weeds in the vicinity of railroad property, digging of ditches, cutting of avenues in timber tracts and the application of fire resistive coatings to woodwork exposed to the accidental lodgment of sparks or hot coals; and by keeping the towers and trestles of bridges and trestles in good order.

While sparks from smokestacks or cinders from ash pans may be classed as the primary cause of fire started in this way, the secondary cause is running with damper doors not entirely closed. What may also be termed secondary is the bad condition of shingle roofs, platforms, tres-tle, roofs of wooden cars, exposed inflammable merchandise in cars, or rubbish about buildings. If the secondary causes were taken care of the result through the primary cause would be reduced to a minimum.

The various motive power departments of the railroads, as well as the Master Mechanics' Association, have given this matter a great deal of consideration and standards have been adopted which, it has been believed, would give generally satisfactory results, by meeting both the conditions of service and minimizing the hazard. On some of the large railroads severe service tests have been made; spark arresters have been given careful constructive consideration, and in many instances the losses from sparks have been greatly decreased. It is a question for the committee to emphasize whether it may not be possible in the future to eliminate fires from this cause entirely. It seems to be a question for the master mechanics, shop and roundhouse foremen to solve by periodical inspection and careful maintenance, as we who are studying the prevention of loss by fire, must necessarily defer to a large extent any investigation of or judgment as to the correction or elimination of the spark hazard to those dealing more directly with the mechanical contrivance concerned.

The main point that this committee can emphasize, therefore, is the importance of the inspection of spark arresters and ash pans; not a haphazard inspection, but an examination of the screen to see if it is stripped or worn out; if the wires are spread, if the fittings around the sides of manhole cover, the nozzle and steam pipes are tight; to see if the ash pan dampers, damper controlling devices and the extension of pan outside of mud ring are in good order. There should be a weekly inspection of all engines and a duly authorized form of report provided, on which the signature of the inspector making the examination should be recorded. There should also be an inspection when any repairs are completed and the locomotive again turned over for road service with the corresponding signature of the inspector making the final inspection. In addition to this, we would recommend that efficiency committees be authorized to check up the inspectors. We also recommend that whenever fires occur on or near the right of way, alleged to be caused by sparks, a report be immediately made of the condition of the spark arresters and ash pans of the locomotives passing the location several hours prior to the fire and that such report be checked against the last weekly inspection of these engines. We also recommend the following as a systematic method of dealing with the subject:

"Master mechanics and engine house foremen should see that all locomotives are properly inspected after each trip, and that any defects in ash pans or ash pan gear are properly reported on special form for that purpose and repairs made.

"Weekly, or at staybolt or boiler wash period, the front end of locomotive must be opened and examined and a special examination of ash pans made. The condition of front ends and ash pans must not only be reported on special form for that purpose, if repairs are necessary, but the condition as found must be carefully noted in book or blank form and signed for by the inspector or inspectors actually making the inspection.

"If repairs are necessary, the front end and ash pans must be re-inspected upon completion of repairs and proper notations as to condition made in the book or blank provided for that purpose and signed by the inspector actually making inspection.

"Books or blanks when filled should be forwarded to the master mechanic upon whose division the locomotive has been in service, and he will send them to the superintendent of motive power."

Accompanying these suggestions is the blank form of report recommended for use.

We believe with a uniformity in respect to careful maintenance of the corrective influences that have been devised that much can be done in preventing the large fire waste caused by flying sparks.

This, however, must receive careful individual co-operation on the part of all railroads and then the motive power departments, and our hope is that we may be able in the future to acknowledge the result of the work of some inventive mind that will bring about the entire elimination of fires caused by sparks thrown from the smoke stacks of locomotives.

Bulletin No. 3 gives general recommendations in connection with chimney flues, stoves and furnaces. Bulletin No. 4 relates to boiler houses, boiler settings and boiler stacks.

Bulletin No. 5 deals with the storage of railway fusees and torpedoes. The handling of these supplies possibly has not resulted in any serious fire loss, but there have been sufficient damage resulting from lack of care and difference of opinion as to proper methods to lead the committee to take up the subject with a view to possible improvements. An abstract of the bulletin follows:

Railway fusees and track torpedoes are classed in the group of "Less Dangerous Explosives" as fireworks; more specifically fusees as "Common Fireworks" and torpedoes as "Special Fireworks" with placards "Inflammable," "Handle Carefully" and "Keep Fire Away."

The hazard of railway fusees and torpedoes is recognized by the "Bureau of Explosives," to whom due acknowledgment is given for suggestions as to handling or storage.

Fusees when handled in original unbroken shipping packages in quantities at distribution centers should be stored in a small magazine, preferably forty feet from other buildings or lumber, The magazine should be lightly constructed and covered inside and out with incombustible material. It should keep out rain, snow and sparks, and should be provided with a ventilator. No artificial means of heating or lighting should be employed. The magazine should be sufficiently dry if supported on posts or pilings a foot or more from the ground, and so arranged that there is free circulation of air beneath.

Not more than four gross of fusees should be kept in the general storehouse at one time. Any broken packages should be kept in a tight metal lined or asbestos board lined wood box with a spring hinge or self-closing cover. This box should be used for no other purpose and kept in a dry place, not in proximity to any artificial source of light or heat.

Torpedoes when handled in original unbroken shipping packages in quantities at distribution centers should be stored in a separate magazine similar to that used for fusees.

Not more than ten gross of torpedoes should be kept in the general storehouse at any time. Broken packages or loose torpedoes should be kept in a tight asbestos board lined wood box, with sliding cover, used for no other purpose. A sliding cover is recommended in preference to a drop hinged cover to prevent premature explosions in case a torpedo should rest over the edge of the box. The box should be kept in a dry place not in proximity to any artificial source of light or heat, and care should be taken to prevent the accidental dropping of torpedoes on floors where they might be stepped on or run over by trucks.

Placard all magazines and storage boxes: "Explosives—Handle Carefully—Keep Fire Away." Do not store fusees and torpedoes in same magazine or box. Do not store fusees and torpedoes with other explosives or inflammables. Exercise care in keeping fusees dry—improperly made fusees if damp are liable to spontaneous ignition. Broken, wet or oily fusees should be destroyed by burning. Broken or defective torpedoes should be destroyed by immersion in water.

We suggest as a suitable receptable for such loose supplies as have been obtained by trainmen from storehouses a small metal or rectangular shaped wood box with spring hinged cover. The box should be only large enough to hold the requisite number of fusees and one end partitioned off for torpedoes. In cabooses racks may be used to advantage for fusees.

The above suggestions are not meant to interfere with any special and safe practice now followed, such as that relating to trainmen's metal receptacles as are now used for carrying flags, fusees and torpedoes.

Bulletin No. 6 deals with storage and handling of small oil supplies at miscellaneous properties. An abstract follows:

One of the greatest hazards is the storage of oil without proper safeguards, and this undoubtedly is one of the most difficult hazards to guard against.

On railroads having little fire prevention supervision, small supplies of oil will be found scattered around throughout the various station buildings, the quantity and location depending on the convenience of the user. At many places the oil supplies will be surrounded by an oil soaked floor and small quantities of oily waste or rags will be in evidence, no thought whatsoever being given to the hazard involved. The danger of such storage without proper precautions is evident, particularly where floors become thoroughly saturated from constant lamp filling drippings.

The fire loss records show that too little attention is being paid to safeguarding the country stations against loss; and a study of this subject will show that a large percentage of fires in them are of unknown origin. Many agents use oil for illuminating purposes; many also take care of signal lights, and in some cases they keep a supply of gasoline for cooking and motor car purposes. Sometimes this oil is kept outside of buildings, but more often it is found stored in the coal bin, or in one corner of the freight room, and quite frequently with records or in concealed places like closets underneath stairways.

The hazard of spontaneous ignition is often present with improper oil storage and handling, for although pure mineral oils in combination with cotton or oily waste or rags will not oxidize and the hazard of spontaneous ignition is not present when they are used, they are often adulterated with vegetable or animal oils and therefore the presence of oily waste in railroad properties is always a menace.

We therefore make the following suggestions and recommendations: Oil storage of every nature at properties other than standard oil houses, wherever possible, should be entirely removed from station buildings and other properties and housed in a separate and inexpensive structure built expressly for that purpose, in a portion of which provision can also be made for the coal supply. This combination coal and oil house should be located a sufficient distance from all other properties to permit possible destruction by fire without endangering any other structure, but not far enough away to be inconvenient. All lamps and lanterns should be filled and trimmed in this structure.

The use of ordinary metal trays or sand boxes is better than allowing cans of oil to set on wooden floors of freight house, but your committee recommends that a separate, isolated coal and oil house be given preference and that if for any reason this cannot be arranged or wherever it becomes impracticable to constuct a separate building, a metal lined oil cabinet be installed in the freight room.

Regardless of where or how oil is stored a supply of fine dry sand for extinguishing fires should always be on hand.

At large terminal warehouses, where electricity is used oil is frequently kept in buildings (generally in the basement) often in large quantities, for use in car heaters during the Winter months or for oiling warehouse trucks, etc. No matter what precautions are taken to guard against fire the danger is too great for the

values at risk. It is recommended in such instances that a separate building be constructed similar to that suggested for station buildings and miscellaneous properties. Where it is felt that a large expense is warranted, or the city ordinance or fire authorities prohibit the construction of a wooden building, a brick oil house should be built.

In the report of the Committee on Statistics and Forms, presented by B. F. James (Colorado and Southern), chairman, there were submitted several forms as follows: Causes of fires; classification of property losses; telegraphic advice of fire; detailed report of fire (by mail); card notice of fire to be thrown off by trainmen notifying section men of fire; local fire prevention report; fire department drill report; fire inspector's report.

Two of these had been used by the committee in connection with its work in the past year, and it was ascertained that the fires in the past five years on the roads investigated (ranging from 19 roads operating 27,596 miles in 1909 to 28 operating 39,576 miles in 1913) were traceable to the following causes:

Unknown	44.29 per cent
Sparks from engines	20.47 per cent
Heating and appliances and flues	6.17 per cent
Caught from adjacent property	4.55 per cent
Tramps and trespassers	3.87 per cent
Incendiary	2.79 per cent
Coals dropped by engines	2.45 per cent
All other causes	15.41 per cent

The total fires in these five years numbered 10,160, the total loss was, including railroad property and lading liability, $5,840,644, an average of $574.86 per fire.

The report on Fire Fighting Organization presented by E. B. Berry (Southern Railway) chairman, emphasized the necessity of forming fire fighting brigades and of regular drills at frequent intervals.

The report on Fire Fighting Apparatus presented by B. S. Mace (B. & O.) chairman, treated primarily of the apparatus used or needed at local freight and passenger stations, at coaling stations and on engines and cars. A brief description was given of the practices that are generally followed on most roads and various recommendations were made for the further extension of good practices or for the remedying of bad ones.

The officers of the association were re-elected to serve for the following year. They are: President, F. H. Elmore, Southern Railway; vice president, P. Hevener, Chicago, Rock Island and Pacific; secretary and treasurer, C. B. Edwards, Mobile and Ohio.

New executive committee members were chosen as follows: One year, C. S. Sherwin, Missouri, Kansas and Texas; three years, B. F. James, Colorado and Southern; C. N. Rambo, Norfolk and Western.

INDUSTRIAL AND INSURANCE DEVELOPMENT IN THE AUTOMOBILE FIELD

By A. T. Graham.

THE appearance of the automobile a few years ago called forth a form of insurance protection theretofore unknown, namely, that of motor car insurance, such as would protect the owner of a gasoline or electrically propelled vehicle against practically all financial losses incident to the ownership and operation of his car, except deterioration, wear and tear.

An address before the Fire Insurance Club of Chicago.

The growth of the automobile industry during the last six years has exceeded that of any other industry for a like period in the history of the world. The appearance of motor cars upon all the public highways of the habitable globe bears testimony of this phenomenal growth.

When we realize that the automobile industry in this country had its inception only about sixteen years ago, and that it is now and has been for some time the third largest industry in the United States, we will have some faint idea of the magnitude of this business.

The value of the automobile output in the United States increased over 5,100 per cent between the years 1899 and 1909, and the wage earners in this industry increased nearly 3,300 per cent in the same period. Notwithstanding these enormous percentage increases, these statistics are of little significance as regards present-day conditions in the industry. The government collects this sort of statistics and publishes it in a census report at five-year intervals. There will be another census published in 1915, and it will, no doubt, show an unprecedented development since 1909.

The total capital employed by companies in North America making automobile accessories is over $200,000,000, exclusive of companies making tires.

It is estimated that one in every sixty-six persons in the United States is a motorist.

There were over 1,450,000 cars registered in the United States in 1913. Of this number 88 per cent, or 1,276,000, were pleasure cars, and 12 per cent, or 174,000, were commercial cars.

Less than 4,000 cars are said to have been imported from other countries during the past three years, while an enormous number were exported. No exact figures showing imports and exports will be available until next year, when the Government census report is issued.

Ninety-four per cent of all the cars in use in the United States were made in this country. This shows that only 97,000 cars of foreign make are owned in America, due, no doubt, to the high duty imposed on imported automobiles.

There were 696,348 licensed drivers in the United States in 1913, and if these and others employed about cars at an average wage of only $15 per week, the compensation for services alone would have aggregated upwards of $598,038,584 for that year.

It is estimated that one million persons are employed, in one way or another, in the motor trade, and that three millions of our population are supported directly and indirectly by the manufacture of motor cars.

The output of American cars for the sixteen years, ending with 1913, was as follows:

Year.	No. of Cars.	Est. Value.	Year.	No. of Cars.	Est. Value.
1898	200	$200,000	1906	33,300	$45,000,000
1899	600	600,000	1907	45,300	65,000,000
1900	2,000	2,000,000	1908	55,400	100,000,000
1901	5,000	5,000,000	1909	82,000	130,000,000
1902	9,000	15,000,000	1910	180,000	185,000,000
1903	15,300	20,000,000	1911	215,000	275,000,000
1904	20,100	25,000,000	1912	300,000	375,000,000
1905	28,400	30,000,000	1913	400,000	500,000,000
Totals				1,397,609	$1,772,809,000

Conservatively estimating the 1914 output of cars at 500,000, with an average value of $1,250 each, this would add $625,000,000 more to the aggregate value of $1,772,809,000, making a grand total of 1,897,609 cars, and $2,397,809,000. If all these cars were placed end to end they would form a line reaching from San Francisco to New York and from New York back to Chicago.

The estimated number of American-made pleasure cars in use

at this time in the United States is 1,350,000, with an approximate value of $1,350,000,000.

Over half the cost of a motor car represents labor, in one form or another, and half the cost of repairs and renewals also goes to labor.

The benefits of all the expenditures of motor cars goes directly to the industrial classes, at the rate of about one billion dollars annually.

The annual outlay in the United States for tire renewals and tire repairs alone can safely be placed at $234,630,000, divided as follows:

Cars one year or more old (not Fords)..	850,000 @ $240.50 =	$173,442,500
Ford cars one year or more old.....	150,000 @ 98.50 =	14,700,000
New cars (not Fords)	325,000 @ 121.50 =	39,487,500
New Ford cars	175,000 @ 40.00 =	7,000,000
	1,500,000	$234,630,000

The editor of "Motor," one of the leading trade journals, recently worked out the following interesting table of tire costs:

Cars one year old or more:	
Not Fords:	
Four shoes at $30.00.....	$120.00
Adjustment on shoes	40.00
Six tubes at $5.75.....	34.50
To repairs	10.00
	$204.50
Fords:	
2 shoes at $12.50	$25.00
2 shoes at $18.50.....	37.00
Adjustment on shoes	10.00
3 tubes at $3.00	9.00
3 tubes at $4.00	12.00
To repairs	5.00
	$98.00
New Cars:	
Not Fords:	
2 shoes at $30.00	$60.00
Adjustment on shoes	40.00
2 tubes at $5.75.....	11.50
To repairs	10.00
	$121.50
Fords:	
To new shoes, adjustments and repairs.....	$40.00

The total tire cost above mentioned is based on the foregoing estimates.

American motorists paid approximately $9,500,000 for licenses alone in 1913, and when we add to this the running expenses, incidentals and purchase cost, and the indirect expenses, such as cost of suitable clothing, hotel and traveling expenses, it will be seen that the total cost of motor ownership and operation must reach up to billions of dollars per year, and that a great many people must be benefitted thereby, either directly or indirectly, especially the industrial classes. If we add depreciation to the above expenses the total expenditure upon all branches of motoring will reach the enormous sum of over three billions of dollars annually at this time.

In less than seventeen years 547,609 cars and $1,047,809,000 have disappeared, due to fire and collision losses, and depreciation, making an average annual loss of automobile product of $61,635,823.

There are probably 1,509,000 motor cars of all kinds, including commercial cars and cars of foreign make, in use in this country at the present time, conservatively valued at $2,000,000,000.

Motoring is a popular pleasure, and therefore the demand for pleasure cars will continue to keep pace with the financial ability of the people to indulge in this form of pleasure.

The motor truck is rapidly taking the place of the horse, and therefore we may reasonably expect a largely increased output of this type of car in the future. This branch of the automobile industry is growing in leaps and bounds. The horse is not immune from the numerous ills to which flesh is heir, nor can he escape the infirmities of old age. He must be fed and sheltered and harnessed. He becomes an unproductive asset when sick. His ability to pull a load cannot always be employed to its fullest extent, because the law restricts man from imposing too heavy a burden upon him. These are some of the considerations which prompt merchants to substitute the motor truck for the horse.

Eventually, when the demand for the gasolene-propelled pleasure vehicle shall be on the wane, many manufacturers will undoubtedly retire from the business, either voluntarily or through failure, and only the builders of the better grade of cars will remain in the field. These, in turn, through their efforts to reduce operating expenses, will, in all probability, form combinations, and the competition of these combinations—one with the other—will, in the end, result in further consolidation, so that, eventually, only a few large manufacturers will be left to carry on the business.

While this process of elimination and curtailment is going on the annual output will gradually decrease until it reaches a certain level, and thereafter the fluctuation will be above or below this level, according to the natural conditions of trade. Standard cars will then be built and the demand for a new model every year will be reduced to a minimum.

While we are leading up to this stage the insurance companies will have an ever-increasing moral hazard to deal with. It has been truthfully said that a motor car is the rich man's plaything. Most men of ordinary means do not realize that the first cost of a machine is not the only heavy expense to be considered. The cost of maintenance and incidental expenses are important items to be reckoned with. People will continue to deplete their savings accounts, to borrow money on their life insurance policies, to mortgage their homes and even their household furniture, for the purpose of raising money with which to buy automobiles, and these are all danger signals to a well-conducted insurance company.

The question of depreciation is another important item that should not be lost sight of. There is only a short span between the date of purchase and the time when the investment vanishes. Any car used moderately for pleasure driving and kept in the best of condition is bound to depreciate from 20 per cent to 30 per cent the first year, and from 10 per cent to 20 per cent during every succeeding year; and when a car is used for touring long distances, over rough roads, it depreciates more rapidly.

Cars used for livery purposes, especially those equipped with taximeters, are usually subject to the greatest depreciation, on account of frequent use and the resulting wear and tear. Starting a machine suddenly to run at a rapid pace, and stopping abruptly, as is often the case with taxicabs, does not conduce to longevity in a machine. I have been told by owners of taxicabs that it takes about two years' receipts to defray the cost of a car of this sort, and the expense of maintenance, and that the car is of little value thereafter.

Ordinarily the taxicab chauffeur makes his car cover the greatest distance in the shortest time, because the mileage registered indicates the price of the service. Rapid running increases the danger of damage from collision, and every time an injury from this cause is repaired, the desirability of a car is lessened and its value decreased.

You may, perhaps, be interested to know why a motor car is subject to so high a percentage of depreciation the first year as compared with the low percentage of depreciation for each succeeding year. This is due, in a large measure, to the practice of

the manufacturer in placing a new model on the market every year. The style of each model is slightly different from its predecessors, and frequently some new device, which experience has suggested, is added. Any one wanting to buy a car would naturally select the latest model, or demand a concession in price. Therefore, the builder himself is responsible for the first year's depreciation on an unused car. If the car has been used, then the depreciation caused by the builder, plus the depreciation caused by wear and tear, or by the fact that the car is second-hand, would have to be deducted from the original list price and the balance would be the selling price at that time.

Most dealers will sell a new car for from 20 per cent to 40 per cent of its list price and take the preceding year's model in trade; hence the dealers generally have come to consider it necessary, in many cases, to sell two cars in order to earn one commission. The car traded in is supposed to be again sold, for its actual cost to the dealer, which includes the cost of repairing and repainting, but it is hard for one to disabuse his mind of the impression that the selling price of the made-over car carries with it at least a small profit.

The component parts of a car are not all subject to the same rate of depreciation. For instance, tires will depreciate much more rapidly than any other part of a machine, because they are constantly in contact with the road and are, therefore, subject to the greatest wear and tear. The machinery for transmitting the power is an important item in the cost of the car and, as this is constantly or frequently in action when the car is being operated, it stands to reason that it is quite liable to wear and tear. Frames and bodies, particularly closed bodies, such as limousines and coupes, are not necessarily liable to abnormal depreciation. Good leather upholstering will last a long time if properly cared for. A leaky radiator will speedily put a good engine out of commission.

There are two sides to the question of depreciation. When the owner of a car applies for insurance he almost invariably assures the agent that his car has had the best of care and is in excellent condition. This representation usually entitles him to the maximum amount of insurance and gives him the benefit of minimum depreciation. I should call this theoretical, or underwriters', depreciation. Actual depreciation is rarely, if ever, determined until after a loss has occurred. Then the adjuster, with the assistance of an expert, if necessary, goes into details, and in a majority of instances his investigation results in the discovery that the depreciation was under-estimated and the car over-insured. Occasionally, in such a case, the assured will refuse to settle on the basis of the adjuster's figures and will demand an appraisal. Ordinarily the reasonableness of the adjuster's offer is borne out by the award of the appraisers.

The Boston Insurance Company was the first American company to write an automobile policy. Lloyds of London soon followed and their contracts were so favorable to the assured that a great majority of motorists selected them in preference to the forms of indemnity furnished by the Boston and by other stock companies which subsequently came into the field.

The first motor car policies issued by Lloyds of London, in this country, were known as Form No. 1, No. 2, No. 3 and No. 4, and the rates were 2 per cent, 3 per cent, 7 per cent and 6 per cent, respectively. These forms are substantially the same to-day as they were when originally introduced, the only important difference being that the assured was obliged to bear the first loss of $50 by collision under Forms No. 2, No. 3 and No. 4. The broker or agent placing the business was required to inspect every car and was allowed a fee of $5 in each case, in addition to the regular commission. The assured was compelled to pay the $5 fee. Subsequently the rates for Forms No. 3 and No. 4 were reduced to 4½ per cent and 4 per cent, respectively, on all kinds of cars—steam, electric and gasolene—used for both private and public purposes, and the $5 fee was abolished. The deductible average under collision policies was also reduced, first to $25, and later there was no deductible average if the collision loss amounted to or exceeded $25.

At the present time Lloyd's policies cover as follows:

Form No. 1—Against fire, theft (if $25 or more), lightning, explosion, self-ignition, salvage, and the risks of transportation and navigation, such as collision, derailment, sinking and stranding. The territorial limits are the United States, Canada, Europe and elsewhere if required. Detached bodies and equipment are covered under a clause which in effect requires the owner to carry full insurance, or, failing so to do, restricts recovery to a pro rata proportion of the value insured.

Form No. 2 is the same as No. 1 and contains an additional clause assuming liability for collision damage to the car insured (except the first $25, which must be borne by the assured) if the damage is caused by collision with a railroad or street car, or with a municipal fire department vehicle, or fire insurance patrol wagon. There is very little demand for this form.

Form No. 3 also insures against all the perils covered under Form No. 1 and, in addition, covers damage by collision with another object, to the assured's car, and to other property, if the assured shall be held to be legally liable for and shall pay for the same. It also covers loss or damage to the assured's car caused by running into open draws. The underwriters exclude, under this policy, the initial collision loss of $25.

Form No. 4 is the same as Form No. 3, except that it does not cover collision done, or third party liability; that is, it does not cover the assured's liability for physical damage to the object collided with. (The underwriters do not cover collision damage to tires under Forms No. 2, No. 3 or No. 4 unless the total collision damage to the car is at least $50.)

For an additional premium of $15, the underwriters will pay all theft losses under any one of these four forms.

A discussion of the subject of motor car insurance necessarily involves a reference to Lloyds of London because these underwriters were instrumental in the early stages of the business in furnishing the only forms of indemnity in this line that met with popular favor. Lloyds gets its name from Edward Lloyd, who kept a coffee house in London more than 200 years ago. In those early days British citizens interested in shipping were in the habit of congregating at Lloyd's Tavern and speculating with one another as to the outcome of certain ventures upon the high seas.

History furnishes fragmentary evidences of the existence, at earlier dates, of crude schemes of indemnity in certain parts of Continental Europe, but it is generally admitted by the best authorities that the business of insurance originated with our British cousins at the time stated.

The speculative habit referred to subsequently projected itself into the maritime world, thus affording the owners of ships and cargoes an opportunity, for a money consideration, which we now call a premium, to protect their property against the perils of the sea during the time consumed in reaching the port of destination.

These speculators afterwards became known as insurers, or underwriters, and the business grew to enormous proportions. This growth suggested the necessity of safeguards and the Corporation of Lloyds was formed under Royal Charter. This corporation has absolutely no control over a member's business

transactions. Its principal functions are to provide a meeting place and agencies for the collection of shipping news. Its executive committee enforces certain rules of eligibility to membership, and among these it requires from every underwriter a deposit of £5,000, or its equivalent in gilt-edge security, before permitting him to transact a marine business, and an additional £5,000 before granting him authority to take up other lines.

The standard of membership is kept at a high point because the commercial honor of Lloyds must be maintained. Each member voluntarily carries insurance with other underwriters against insolvency. Every underwriter must have his accounts audited by public accountants once every three months, and if the reserve on his outstanding business has fallen below 40 per cent, he must immediately make good the deficit or submit to a suspension of his privileges.

Commissions only are deducted from premiums and the balance must be kept intact (except that losses are deducted) until the expiration of the policies. It will thus be seen that Lloyds are required to put up a larger reserve on their business than is required of the stock companies.

There are approximately 800 underwriting members at Lloyds and possibly half of this number only do a general insurance business, the remainder confining their operations to marine and kindred branches.

Nearly all the American and foreign stock companies engaged in writing automobile insurance in this country issue a standard policy known as the conference form; that is to say, the policy of each company is identical as to phraseology with the policies of all the other companies. This policy covers the body, machinery and equipment of a described car within the limits of the United States (excluding its possessions), and Canada; also while on coastwise steamers between ports within said limits. It covers loss by fire from any cause whatsoever; loss by collision and derailment while aboard a railroad car, and loss by sinking, stranding and collision with another vessel, while aboard a steamboat. It also covers theft, if amounting to $25, excepting theft committed by persons in the employment, household or service of the assured. It stipulates that passengers shall not be carried for compensation and that the car insured shall not be rented or leased.

Extra bodies, equipment not in use or on the car, robes, coats, hats, caps, gloves, leggings, boots, goggles and chauffeurs' livery are not insured under this policy, except by endorsement and for a specific amount. If the car insured has more than one body, the additional or detached body would not be covered, unless the additional body clause should be attached to the policy. This clause states that the amount of the policy shall be divided into three parts—one part applying to the chassis and equipment, one part to the touring, or other open body, and one to the limousine, or other closed body. It is necessary to employ this rider, for the reason that without it a loss might occur to a detached body, and, in that event (there having been no predetermination as to its value), it would be difficult, if not impossible, to fix the liability of the company, or rather to fix the measure of loss that the company should pay in such a case.

If personal effects, such as chauffeurs' livery, gloves, goggles, etc., are to be insured, they must be covered under the "Personal Effects" endorsement, for a specific amount, and in consideration of an additional premium, to be computed at the same rate as is charged on the automobile. This endorsement excludes loss from theft, robbery and pilferage; that is to say, losses from these causes must be borne by the assured.

Should a policyholder require insurance on his car while abroad, it would be necessary for him to secure what is known as the "European Privilege Clause." This clause permits him to take his car to the United Kingdom of Great Britain and Ireland, and to Continental Europe, and covers it while there. It also includes the ocean risk both ways. An additional charge of one-half of one per cent is made for this extension of coverage, to take care of the water-borne risk. While the present war is raging in Europe, it would probably be impossible to secure the European coverage.

When a car is used for carrying passengers for compensation a special rider must be attached to the policy permitting the same, and the assured must pay an additional rate of 1 per cent for the privilege.

The fire companies will, upon request, eliminate the theft and automatic reinstatement features from their policies and allow a reduction of one-half of one per cent on gasoline livery, renting, pleasure and commercial cars, and one-fourth of one per cent on steam, electric and all dealers' cars. It is a foregone conclusion that but few policies excluding loss by theft can be sold in large cities, although there is a possibility of a large demand for this form of contract in the smaller places where the danger of theft losses is at a minimum.

Damage from collision to an insured car is assumed under what is known as the "Collision Damage Sustained Clause," which covers damage to the automobile in excess of $25, by being in collision with any other automobile, vehicle or object, excluding loss to tires, unless the total collision damage to the insured car exceeds $200. This clause excludes damage caused by striking any part of the road-bed; by striking the rails or ties of street, steam or electric railroads; by being operated in a race or speed contest, or while being operated by any person under sixteen years of age, or under the age limit fixed by law. The first loss of $25, which the assured is obliged to stand under this clause, will be assumed by the company in consideration of an additional premium of $35.

The "Collision Done," or property damage rider, indemnifies the assured, in case he is legally liable, for physical damage by collision to the property of others, when caused by the automobile insured. Should the object collided with be another automobile, and should a fire occur in the other automobile, as a result of the collision, then the damage done by the fire would also be covered under this rider to the extent of the insurance covered thereby. This risk is sometimes called third party liability.

Many policyholders and, I am sorry to say, some agents and brokers, labor under the impression that the face of the policy should be paid when the subject of the insurance is a total loss. Even if it were possible to determine the value at the time of issuing the policy, there would be no sure rule of predetermining the depreciation up to the time of loss, if one should occur during the policy period. If an attempt should be made to appraise every car when insured the rates would have to be raised considerably in order to meet the added expense of the business.

When the assured holds a valued contract the company has no alternative but to pay the face of the policy in case of total loss, even though the value at time of destruction be much less than the amount insured. This emphasizes the absurdity of the valued form and the necessity for its abolishment. Scarcely any kind of property depreciates as rapidly as a motor car; hence, a company should reserve the right to ascertain the actual loss after the occurrence of the accident and not pledge itself at the time of issuing the policy to pay a stipulated amount in the event of total destruction. The valued policy creates a moral hazard, it encourages fraud, and its use should therefore be discontinued

except in such cases where the amount of insurance is limited to the sound value at expiration of policy.

A public liability policy covers the legal liability of the assured to any one or more non-employes for fatal and non-fatal accidents to the extent of $5,000 for any one person and $10,000 for more than one person involved in one accident. This policy also pays the cost of first medical or surgical aid and the expenses of litigation, even if the case be groundless.

Inasmuch as fire from any cause whatsoever is covered under both Lloyds and the Conference form, there is no necessity for excluding it in the collision riders of these organizations, but it must be remembered that the collision clause of the liability companies specifically excludes loss from fire caused by collision. In other respects, however, all collision clauses are practically alike, except that under a liability policy the assured can almost invariably recover up to $5,000 for collision, whereas under the other forms he would be limited to the amount of the policy. The explanation is that automobile liability policies are, almost without exception, issued for a limit of $5,000 on any one person or automobile.

The property damage rider of the liability companies is a broader cover than that used by the automobile companies, because it, as well as the liability policy itself, covers all the assured's legal liability to financial loss resulting from the maintenance or operation of his car.

I have often wondered why the fire insurance companies ever undertook to cover third party losses. This is purely the function of a liability company. The liability companies have also usurped the function of the fire insurance companies by covering, under their policies, collision damage sustained, which is purely the function of the fire insurance companies. I believe the day is not far distant when this inconsistency will be corrected. No assured can be made legally liable to himself, and therefore it is not within the province of a liability company to indemnify the assured for such losses as he may sustain to his own property, any more than it is within the province of the fire insurance companies to assume the obligations of the assured for third party liability, damage done, or property damage, all of which terms are synonymous.

The charge for property damage should be based on the weight of the car and not the horsepower. The extent of third party damage depends very largely upon the ability of the colliding car to damage the thing collided with. A heavy car coming in contact with a light car is quite likely to damage the latter to a greater extent than would be possible if the impact were caused by a light body. On this theory the more a car weighs, the higher the rate thereon should be for property damage insurance.

The Chauffeur's Endorsement covers the legal liability of the assured to his chauffeur as defined in the Workmen's Compensation Law of any State of the Union.

The automobile rating system in force in the United States for a short time was so complicated that insurance agents and brokers generally did not pretend to understand it. This system was the outgrowth of the limited experience and ideas of different interests, but it had to give way last April to a more simplified system.

The old rate schedule covered by provided starting or basis rates under twenty four different headings embraced in two schedules, known as No. 1 and No. 2. These headings were denominated "A to H" and "J to Z." These letters of the alphabet indicated, in Class No. 1, original list prices of cars when new, excluding cost of additional equipment and extra bodies. Class No. 2 schedule covered rates on old cars and cars not in the hands of the first owners. As a car decreased in value from age, wear, tear and other causes, the rates decreased under each one of the alphabetical denominations enumerated, stopping only when the value left was indicative of what might have been regarded, from an underwriting standpoint, as an uninsurable risk. The maximum rate shown in these schedules was 4⅞ per cent. If the underwriter was willing to write a car for any amount below the minimum for which a rate was provided, it was optional with him to charge a higher rate, if it could be collected. These schedule rates applied to private pleasure gasoline automobiles and commercial cars only.

Electric cars were insured at 1½ per cent for any amount, or for 1.375 without theft.

Private and commercial steam cars, of current or succeeding year's model, could be written at 3 per cent and older models at 3½ per cent. If the boiler and burner were located in front of the dashboard, the rate could be reduced one-quarter of 1 per cent in each case. One-eighth of 1 per cent was allowed for the elimination of theft.

If a car were used for carrying passengers for compensation the schedule rate was increased 1 per cent.

Cars in the hands of dealers, if second-hand, were insurable at 1 per cent over the schedule rates for dealers.

The rates charged by the fire and liability companies for collision damage sustained—that is, collision damage to the car insured—on private, gasoline, steam and electric cars, and cars at sales agencies, ran from $28 to $200, according to the type and value of the car insured. The rate manual prescribed twenty-six different premium charges, each charge being designated by a letter of the alphabet for the sake of convenience. These premiums were computed at 2 per cent of the original list price of the car, with equipment, except that the minimum charge was $28 and the maximum $200. Lloyd's rates for this coverage were 5 per cent less than the stock companies' rates.

The new schedule does not discriminate between old and new cars, except as age is reflected in reduced amounts of insurance, the theory being that as a car increases in age the amount of insurance necessarily decreases, due largely to wear and tear, and also to reduced market values. The partial loss ratio, however, is not reduced on old cars, and hence the necessity for increasing the rate in order to produce a sufficient amount of revenue with which to meet partial loss payments. The new schedule is also competitive.

There are but three classes now, namely, A, B and C. All cars listing at over $3,500 come in the "A" class, all cars listing from $1,500 to $3,499 come in the "B" class, and all cars listing from $700 to $1,499 come in the "C" class.

For models of this year and next year the starting rates are 1½ per cent, 1¾ per cent and 2 per cent, respectively. For last year's models the rates are 1½ per cent, 2 per cent and 3 per cent. For models of year before last the rates are 2¼ per cent, 3½ per cent and 4 per cent, and for cars three years and older the rates are 2¾ per cent, 4½ per cent and 5 per cent, on the A, B and C class above mentioned, respectively. The schedule also carries with it minimum premiums of from $7.50 to $15. The above cars may all be written for 50 cents less than the rates specified for what is known as the "stripped" policy; that is, where the theft and automatic reinstatement features are eliminated.

For cars listing at less than $700, the rate for this and next year's models is 2½ per cent for fire and theft, minimum pre-

(Continued on Page 702.)

FINANCE AND COMMERCE

FOREIGN developments have not been adverse to the hopeful efforts to revive general business represented by the decision finally arrived at this week to make a gradual beginning of open dealings on the New York Stock Exchange, starting with listed bonds, transactions remaining under certain supervisory restrictions not customary in normal dealings. Such progress as this denotes in the readjustment of financial and commercial affairs could not have been made if events abroad had furnished any disturbing surprises, but this is no reason for qualifying satisfaction over the actual foreign occurrences. American sympathies and convictions amount to a persuasion that the world's interest will be served by a defeat of Germany's pretentions, and military and financial news has lately suggested the steady weakening of the German position in the war.

The effectiveness of the Russian offensive has astonished military observers, and it would seem to be only a question of time now before the German nation must realize that it has undertaken an impossible task. This may not mean the early collapse of the war, but once it becomes clear that Germany can only wage a losing conflict, the banking and business world will be endowed with the power to hasten the conclusion of the war which they lacked to prevent it. This is all the more strikingly suggested by the consideration of the price of the German reichsmark. All the official news and press bureau advices which are controlled by the wonderful German organization of every field of human interest assert the wonderful financial preparedness of Germany for the war and the astonishing record of economic stability which it is making. Nevertheless there is the 10 per cent discount at which the reichsmark is quoted in all money markets, a discount which is increasing, not diminishing. It is not our purpose to review the obvious and probable causes for the depreciation of the German monetary unit. It suffices to direct attention to it as a sign of the weakness underlying the German military situation.

On the other hand, the foreign financial features with which we are most concerned, the phenomena of the London money market in all its aspects, have grown even more auspicious for American fortunes. The British war loan of $1,750,000,000 has had an immense popular success in flotation. It was so largely oversubscribed by individuals that it is doubted if financial institutions will receive any considerable share of the issue. Of course, artifices were employed, such as the Bank of England's offer to make advances on the Government loan without margin and at a price below the Bank rate, but we have to reckon the London money market to-day in terms of a good deal of artifice and take it as it is. So regarding it, the reception accorded to the war loan cannot fail to enhance British banking confidence and the confidence of alien creditors and debtors alike in the British monetary situation.

Loanable funds in London are becoming almost a drug and are bound to find employment, which must mean recovery in trade volumes as well as in financial values, whatever subsequent reaction or decline may be in store. Among other things it is likely that the circumstances of money in London will operate against continued heavy liquidating pressure in securities even though the aggregate of such liquidation is eventually large, and this is of good omen for the experiment which Wall Street is undertaking in reopening the organized securities market. A token of the international improvement is furnished by the recall of Sir George Paish and his colleague of the Exchequer. While they have been conferring with Secretary McAdoo and the Federal Reserve Board, affairs have been righting themselves, to a large extent automatically. The British financial mission does not seem to have accomplished anything along the lines of its original intent, which was undoubtedly to arrange for increased exports of gold from this country, but it may have achieved a satisfactory understanding of the attitude of American finance and arrived at a clearer perception of the prospect which this country has for recovering and maintaining business and financial activity. The departure of representatives of our finance to continue conversations in London on the return of Sir George Paish and Mr. Blackett is very evidently designed to outline policies dealing with future contingencies, involving among other things the probability that command of the foreign exchanges will, in the course of a few months, shift to New York, except as the transfer may be interfered with by international dealings in American stocks and bonds. That is a bridge which we can cross when we come to it, but something will be gained by examining the approach.

Accompanying the movement for Stock Exchange reopening which has made such a brave beginning are significant signs of an incipient speculative fever which may express itself during the Winter in something like a boom in stocks. This might very well be the precursor of a general business expansion, both being responsive to the same underlying cause, the abundance of funds in the money market which is bound to find occupation in some form. The decision to feel out the financial situation by permitting open dealings in bonds is a symptom of the progress which has been made in overcoming the effects of the outbreak of the war and is on all accounts to be commended. There are some things in the financial position and outlook which cannot be ascertained in any other way, and until the organized securities market is restored the country will be handicapped in its efforts to promote a trade and industrial revival. What the consequences of Wall Street's enterprise will be are of course only a matter of conjecture, but as has just been said, the portents of the money market do not only favor Stock Exchange resumption; they imply that processes of inflation have already been prepared by some of the emergency measures resorted to during the last three months, including among other things the haste in setting up the Federal Reserve banking system.

Clearing house certificates are being retired and there has been a retirement of more than a quarter of the total amount of emergency currency taken out. Nevertheless these devices have alrady had an influence in enlarging the lending capacity of the money market, and no matter what the Federal Reserve Board attitude is, the conduct of the Treasury Department is not conducive to a complete and quick withdrawal of all the emergency currency still outstanding. Secretary McAdoo exemplifies to a certain extent all the proclivities of his party for cheap money and plenty of it, and unless we are greatly mistaken the country is about to experience the pleasurable and exciting dangers which result from cheap money policies. A considerable percentage of the emergency currency issue is going to stay in circulation for a long time, to the extent at least of reposing in the vaults of State banking institutions, which can use it as reserve against deposits and therefore as a basis for lending operations. Mr. McAdoo's cotton pool, if it works at all, will have the effect of keeping emergency currency outstanding, and unless we misread the signs in the South, which is already protesting against the discount rate fixed by the Federal Reserve Board as too high, there is an excellent chance that the Winter season at Washing-

ton will be characterized by a struggle in and out of Congress to accelerate the tendencies of the inflationary money market processes already referred to.

The most significant of these processes is denoted by the monetary plethora which has been created by the establishment of the Federal Reserve banks. The management of the New York Clearing House Association is urging people not to regard the colossal surplus reserve of some $175,000,000 as a real surplus, but it is there just the same. There have been similar consequences elsewhere from the setting up of the Federal Reserve banks and the incidental reduction of statutory reserve requirements. Probably the majority of bankers do not yet realize the situation which has been precipitated, but unless we misunderstand it the money market is stuffed with an unprecedented supply of funds for which employment must be found. Inflation which does not take the shape of redundant currency issues, but is represented by a sudden vast access of credit supplies, may obscure the facts, but does not alter them, and of all forms of inflation the hardest to deal with and the one which is most difficult to control is credit inflation. To day the banks have been abruptly vested with a huge lending power and we can be pretty sure that they are going to use it.

At this juncture all thoughtful persons will turn their eyes toward the Federal Reserve Board and observe its action closely. So far the board as a whole has evinced its desire to avoid making any contribution to a stimulation of borrowing operations, but the board labors under impediments. The Federal Reserve Act is a highly defective instrument. It provides for a banking system admirably adapted to cope with a monetary strain however abnormal and excessive. What it does not provide for is a system which will work of itself at normal times or in times of abnormal ease. It is going to be a very expensive system to support, and with the best will in the world the Federal Reserve Board is going to have trouble in refusing to allow the reserve banks to try to make money by fostering a resort to the facilities which they have to offer by way of enhancing the lending power of the open money market. All the time also the board will have to contend with the political considerations that converge in the Treasury, especially in a Treasury administration which has done everything it could to encourage the idea that the function of Government was to make money plentiful.

THE PRICE OF SILVER

The following are the quoted prices of silver in New York (cents per ounce) and in London (pence per ounce) for each day of the past week:

	Sat.	Mon.	Tues.	Wed.	Thurs.	Fri.
New York	49	48⅞	49⅛	49¼	[illegible]	49¼
London	22 11-16	22	22 13-16	23	[illegible]	22 13-16

COTTON

November 28, 1914.

ALTHOUGH there has been little real activity in the cotton futures markets during the past week and although the general feeling of uncertainty as to the course of prices (which now lies wholly with the Southern farmer) prevents the making as yet of any large forward commitments, it is a noticeable fact that the markets have been rather better than steady, and those who have been expecting an immediate decline to a lower level of values have had little encouragement from the general tone of the trading. Since the last ginning report of the Census Bureau it is commonly believed that the season's crop cannot be less than 16,000,000 bales, and may turn out several hundred thousand bales above this figure. The size of the crop, however, appears to have ceased to be a market factor, at least for the present. Everybody knows that there is more cotton in the South than ever before at this time of the year; but it is also a visible fact that most of this surplus cotton is carried by the farmers themselves. There is no pressure of it upon the spot markets anywhere, and shippers who need cotton to fill contracts often find that they must pay rather more than they like to obtain the cotton. The futures markets both those in the United States and the Liverpool Exchange, are still feeling to some extent the selling out of old contracts carried over form the days before the war, and this liquidation has thus far been sufficient to prevent the price of future contracts from rising sufficiently to be completely on a parity with the price of cotton in the South. There is consequently only a very moderate volume of hedge selling and the process of restoring the floating supply of contracts at the new low level of values, which may freely be traded in by would-be buyers and sellers, is correspondingly slow. One cause that is undoubtedly operative to diminish hedge selling is the reluctance of the Southern banks to make advances to local cotton merchants and shippers, on considerable lots of cotton. The banks still have large sums of money owing to them from farmers, to whom they made advances for the raising of the crop. The cotton which the farmers are carrying is the real collateral against these loans; and the banks not unnaturally hesitate to lock up more of their resources in cotton whose sale may be spread over a long period of time. It is possible that the Secretary of the Treasury and the Federal Reserve Board will ultimately discover a practicable method of loaning upon cotton the $135,000,000 of the Cotton Loan Fund, of which there has been so much said. Should they succeed in this, it is probable that the Southern banks would be relieved of some portion of their old loans and put in a position to make new ones. But thus far lack of adaptation to the requirements of the trade has characterized the proceedings in connection with the Cotton Loan Fund, and it cannot be said that the latest reports about it indicate any real progress in the right direction. Perhaps at the moment the project is doing more harm than good, inasmuch as it is rousing in a multitude of minds hopes that can hardly be realized commercially. In this connection, it may be said that very positive harm will be done, in respect of the price of cotton, if Congress, as soon as it meets, begins to agitate again the fantastical schemes for great bond issues in behalf of cotton which were on the carpet when Congress adjourned. There is but one way to obtain a good and moderately advancing market for cotton during the next few months, and that is gradually to enlarge the trading in cotton, on and off the exchanges. The general interest in cotton, at least in the United States, has never been keener than it is at present and a very large number of persons are closely watching the market with the idea that purchases even at the present price level must eventually prove very profitable. But the ventures of these persons must be gradually extended through the action and interaction of example and cooperation. As time goes on they will assume more and more that burden of the risk of a decline in prices which, according to the economists, it is the function of the speculator or speculative investor to carry for the benefit of producers, merchants and manufacturers. Gradually, too, the burden will become more easy to carry, as the great supply of cotton moves out for consumption and export. There is a very obvious acceleration of this movement already, and before many weeks are past we may expect to hear less of the gloomy prognostications of a calamitously small distribution and use of cotton this year. By this it is not meant to say that the problem of a record-breaking surplus at the end of the season will be done away with, nor that it can be counted as assured that there will at no time be some further temporary decline in the price of cotton. It may well happen that the risk-carrying speculator will prefer to buy some of his cotton at what he considers an irreducible minimum of price and may calculate that all the price-affecting factors of the situation warrant a decline, even if temporary, to the level of prices reached in December and January of 1904-1905,—i. e. approximately 6¼ cents per pound for immediate deliveries in New York, or 6 cents per pound for cotton in the local Southern markets. There can be little question, however, that by the time these prices had been reached the volume of buying would have become ample to care for any possible surplus of this crop over and above the requirements of actual consumption. For this surplus cannot at the most exceed the world's normal consumptive requirements for four or five months; and it is a well known commercial fact that the world's future markets have carried a full year's surplus supply of coffee on a similar basis of prices, having regard to the cost of production.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

FIFTH COTTON GINNING REPORT OF THE SEASON.

On Saturday, November 21, the Bureau of the Census issued its fifth report of the season on cotton ginned from the American crop of 1914-1915. The figures cover the period from the beginning of the season up to November 14. The following table gives the returns by States, with comparisons for last year and for the large crop year, 1911:

COTTON GINNED FOR SEASON TO NOVEMBER 1.

	1911, Bales.	1913, Bales.	1914, Bales.
Alabama	1,239,211	1,181,232	1,263,430
Arkansas	563,115	606,388	735,228
Florida	65,236	53,217	65,903
Georgia	2,106,305	1,823,789	2,061,251
Louisiana	269,548	276,271	341,342
Mississippi	719,638	734,988	838,355
North Carolina	716,200	493,360	555,401
Oklahoma	657,497	666,736	840,634
South Carolina	1,163,984	995,398	1,091,289
Tennessee	264,777	233,663	238,401
Texas	3,473,702	3,313,443	3,511,138
All others	74,023	66,044	82,336
United States	11,313,236	10,444,529	11,624,708

The amount of cotton ginned from November 1 to November 14 was 1,795,626 bales, as compared with 1,342,331 bales ginned in the same period in the season of 1911-1912, or 454,000 bales more. Included in the figures for this year were 32,454 round bales (taken as half-bales), as compared with 74,167 last year, 62,768 in 1912, and 76,011 in 1911. Sea Island cotton included amounted to 53,875 bales, compared with 51,950 bales last year, 40,389 bales in 1912, and 71,199 bales in 1911.

The average quantity of cotton ginned prior to November 1 in the last seven years was 9,406,715 bales, or 74.2 per cent of the average of the seven crops.

NEW YORK COTTON EXCHANGE REVISION OF DIFFERENCES FOR THE GRADES OF COTTON

On Wednesday, November 25, the Revision Committee of the New York Cotton Exchange met for the revision of the differences, or relative valuations of the grades of cotton, for delivery on contracts. Under the new system (which after February 18, 1915, will be superseded by the full commercial difference system), the

differences made at the present session are applicable only to deliveries on December contracts. The following table shows the new differences with comparisons of the old differences:

	Old.	New
Middling Fair	.56 on	.80 on
Strict Good Middling	.42 on	.60 on
Fully Good Middling	.35 on	.56 on
Good Middling	.28 on	.40 on
Barely Good Middling	.21 on	.30 on
Strict Middling	.14 on	.20 on
Fully Middling	.07 on	.20 on
Middling	Basis	Basis
Barely Middling	.25 off	.25 off
Strict Low Middling	.50 off	.50 off
Fully Low Middling	.85 off	.85 off
Low Middling	1.25 off	1.25 off
Strict Good Ordinary	2.00 off	2.00 off
Strict Good Middling Tinged	.14 on	.20 on
Good Middling Tinged	Value of Middling	
Strict Middling Tinged	.20 off	.20 off
Middling Tinged	.10 off	.40 off
Strict Low Middling Tinged	1.25 off	1.25 off
Middling Stained	1.25 off	1.25 off

It will be noted that the grades of Fair, Strict Middling Fair, Good Ordinary and Middling Tinged, all of the New York Cotton Exchange or American standard of classification, are not included in the above schedule of differences, being no longer deliverable on New York Cotton Exchange contracts after December 1, 1914.

Resignation of Sir Charles Macara.—Sir Charles W. Macara's advocacy of reciprocal dealings of cotton has led to his resignation of the presidency of the Federation of Master Cotton Spinners' Associations, says the "Journal of Commerce," the general committee of that body not being in accord with his views on that subject. An official communication states that on Friday, November 6, arising out of a report from the cotton committee of the Federation, the general committee unanimously adopted the following resolution: "It is the opinion of the general committee, no member of any committee or subcommittee of the Federation is entitled to express opinions affecting the interests of the Federation in the press without submitting them to the committee for approval." The terms of the resolution were forwarded to Sir Charles Macara, who was unable to attend the meeting, and in [illegible] letter:

"You will, no doubt, remember that I intimated at the last annual meeting I should be relieved of the position I had held for the past [illegible] only continued it for another year on account of the peculiar circumstances in which the cotton industry [illegible] the resolutions passed by the general com-

(Continued on Next Page.)

NEW YORK QUOTATIONS FOR STANDARD COTTON GOODS AND YARNS

The following were the New York market for typical [illegible] (in cents per [illegible] the present week:

	Monday.	Wednesday.
[illegible]	3	3
[illegible]	4	4
[illegible]	4	4
[illegible]	4	4

mittee would interfere with my freedom of action and render it impossible for me to carry on most of the important work I have done in the past, and which I intend to continue in the future as opportunity occurs, I beg to tender my resignation of the presidency of the Federation."

AN ANALYSIS OF CHINA'S TRADE IN COTTON GOODS

IN the issue of this paper for November 21 the larger possibilities of the foreign trade of China were discussed. Among other things, it was there shown that out of China's $415,000,000 of imports of merchandise, in 1913, more than $110,000,000 in value consisted of cotton goods. This means a tempting market for cotton manufacturers, wherever they may be, and at the present juncture a particularly tempting market for American manufacturers. It is true that for long years American cotton goods have been exported in considerable quantity to China, and that more than once it has seemed as if a commanding position in the Chinese trade was about to be won for the American mills. In recent years, however, American cotton goods exports to China have been decidedly disappointing, both in absolute and in relative amount. Despite the rapid growth of cotton manufacturing in the United States, in both the Northern and the Southern States, there has been during the past decade virtually no gain in the volume of sales of the products of this manufacture to one of the chief consuming markets in the world. Indeed, there has been some falling off of late years from the record of the first two or three years of the decade. The natural growth of the Chinese consumption of cotton goods has been somewhat more than taken care of by the English, the German and especially the Japanese manufacturers. It would appear, therefore, either that the American mills cannot meet the competition of their rivals in costs and prices, or that there is on their part some defect of adaptation to the particular requirements of the Chinese cotton goods trade.

Whatever the cause, however, of the comparative retardation of the American commerce in cotton goods with China, the present situation, with its unparalleled disturbance of the world's cotton trade, seems to call attention anew to what may possibly be accomplished in the way of a real and permanent development of the Chinese market for our cotton products. American cotton manufacturers have such an opportunity as perhaps never before presented itself to turn cheap cotton into the kinds of goods that are specially suitable for the important consuming and importing countries; and thus to establish a substantial export business of a continuous, instead of spasmodic and irregular, character. At the present time, the United States, though spinning more cotton than any country in the world, participates in the Chinese cotton goods trade to the extent of but little more than 5 per cent of the total of that trade. More than this, the American cotton goods actually exported to China are limited to only a few of the simplest kinds required by the Chinese market. Virtually nothing appeals to have been done as yet by our manufacturers in the way of meeting the demand for the numerous varieties of specialized goods which the statistics show to be salable to the Chinese. Perhaps, then, the time is not inopportune for calling the attention of American manufacturers of cotton products to the latest information upon the subject. This is contained in a recent report made to the United States Department of Commerce by Mr. Thomas Sammons, Consul General at Shanghai. As preliminary to Mr. Sammons' statistics and recommendations, however, it will be well to give the figures of the Department of Commerce for the exports of cotton goods from the United States to China for each of the years from 1909 to 1913, inclusive. These are as follows:

MANUFACTURES OF COTTON EXPORTED TO CHINA FROM THE UNITED STATES.

	1909.	1910.	1911.	1912.	1913.
Cloths, unbleached:					
Yards	120,951,387	92,452,575	78,300,455	103,563,291	78,161,164
Value	$6,983,774	$5,609,713	$5,138,515	$7,088,033	$5,373,877
Cloths, bleached:					
Yards	17,415,127	543,238	1,570,050	875,984	25,597
Value	$908,681	$23,817	$96,918	$50,468	$2,732
Cloths, colored:					
Yards	1,620,499	2,045,232	869,037	3,976,194	2,275,086
Value	$111,402	$122,788	$57,961	$233,457	$208,376
Wearing apparel, knit goods, value	$17,759	$17,717	$77,567	$50,413	$120,330
Wearing apparel, all other, value	$22,340	$22,197	$13,692	$31,856	$67,804
Yarns, value	$7,749	$2,210	$1,180	$3,236	$1,685
All other products, value	$15,171	$27,211	$16,065	$11,912	$21,523

With these few classes of goods,—all, with the exception of unbleached and colored cloths, showing small quantities and small values,—may be compared the table, derived by Mr. Sammons from the statistics of the Chinese Maritime Customs and of the Shanghai Foreign Chamber of Commerce, showing the quantity and value of the various classes of cotton goods imported into China in 1912 and in 1913, and the estimated quantities of the several kinds of goods in stock at Shanghai on December 31, 1910. This table is as follows:

IMPORTS OF COTTON GOODS INTO CHINA, 1912 AND 1913.¶

Included Indian, Egyptian T cloths. Turkey reds only. §Pieces. 'In this and other tables in Mr. Sammons's report the equivalent of Chinese money in dollars is based upon a valuation of the Haikwan tael of 74.4 cents in 1912, and of 72.9 cents in 1913, as estimated by the Director of the United States Mint.

The countries of origin of some of the unclassified cotton fabrics appearing in this table under the designation, "All other," are given by Mr. Sammons as follows: Fancy goods, printed drills, sateens, Spanish stripes, Japanese crepe, Jeans—Japan and Hong Kong; cotton yarn—British India, United Kingdom, Hong Kong, Japan, Macao and French Indo-China; T cloths, towels, thread—United Kingdom, Japan, Hong Kong, Belgium; shirtings and jeans—United Kingdom; sheetings—Japan, United States; cotton handkerchiefs, cambrics—United Kingdom, Hong Kong, Japan; cotton drills—United States; chintzes, cotton prints—United Kingdom, Russia, Hong Kong; cotton blankets—France, Germany, The Netherlands, Belgium, Japan, Hong Kong; flannels—United States, Canada, United Kingdom, Austria-Hungary, Japan, Hong Kong.

The shares of the principal countries in China's imports of plain cottons are shown for the years 1909 to 1913, inclusive, in another table included in Mr. Sammons' report. The figures cover shirtings, sheetings, drills, jeans and T cloths. The table is as follows:

IMPORTS INTO CHINA OF PLAIN COTTON CLOTH FROM PRINCIPAL COUNTRIES, 1909 TO 1913.

Country of Origin.	1909. Pieces.	1910. Pieces.	1911. Pieces.	1912. Pieces.	1913. Pieces.
United Kingdom	10,691,448	6,511,126	11,317,630	9,618,386	11,705,426
United States	3,856,231	1,385,819	1,988,061	1,930,836	2,281,123
Japan	1,396,207	2,389,693	2,832,625	3,043,747	5,716,594
British India	132,855	147,952	21,935	26,807	40,054
Totals	16,077,831	10,434,590	16,160,251	14,619,776	19,743,197

Of 40 yards each.

The striking feature of this table is the uninterrupted growth exhibited in the imports from Japan, which were less than half as large as our own in 1908 and were more than twice as large in 1913. Both the United Kingdom and the United States showed a sharp decline in the 1910 figures, and the United States has not yet equalled its showing of 1909. As bearing upon the Japanese success in this field the following remarks of Mr. Sammons are of interest:

"To understand the possibilities of the Chinese market for American cotton products reference must be made to Japan's competition as well as to China's growing production of cotton goods. To hold and increase trade goods of equal quality must be offered at competing prices. Cotton piece goods from Japanese mills and mills operated in China are sold at somewhat lower prices than similar American products, as is shown by the following recent quotations at Shanghai on cotton goods, per piece of 40 yards: American—14-pound sheetings, $3.28, and 13½-pound sheetings, $2.97; Japanese, 13⅓-pound sheetings, $2.44; Chinese—14-pound sheetings, $2.66, and 13-pound sheetings, $2.47.

"Quotations are originally made in local currency, and the fluctuation in exchange is a serious consideration in satisfactory competition. The chief, if not the only, claim of American piece goods to a footing in the Chinese market is based largely on quality; but under the present conditions of commercial stress and uncertainty, the advantage of quality is practically overcome by the higher prices.

"The method of distributing foreign cotton goods employed by Japanese importers is to send such goods to the interior themselves, thus accepting the risks of credit and currency transfers involved and eliminating the Chinese distributing agent. The method used by importers of American goods is to sell for cash to Chinese dealers at Shanghai, thus permitting the Chinese merchant to distribute the cloth throughout the interior. Much criticism has been aimed at the latter method, to which the failure of the United States to gain as rapidly as Japan has sometimes been attributed. Some of the foremost American dealers in American piece goods, however, who have given much attention to the trade questions involved, think it has not been proved that foreign merchants can distribute foreign goods in China at a smaller cost than would be incurred by Chinese traders."

The point made by Mr. Sammons in the above quotation with regard to the difficulties arising from the uncertainties of Chinese

exchange, must be recognized as one of very great importance. American cotton manufacturers are unquestionably handicapped in the competitive struggle for the Chinese cotton goods trade by the lack of direct banking and exchange facilities between China and the United States. This difficulty, of course, affects not only the trade in cotton goods, but that in all the American commodities for which a Chinese market might be built up. Perhaps the new Federal Reserve Act may lead to the speedy establishment of branches of American banking institutions in the Far East. It is sincerely to be hoped so.

A further matter of interest, and one which has probably remained unknown to the majority of American cotton manufacturers whose eyes are turned towards China as an outlet for their products, is the practice of disposing of goods to native buyers by means of auction sales. Of this Mr. Sammons says:

"A large proportion of the total receipts of cotton piece goods imported into China is handled through the port of Shanghai, and it is estimated that one-third of such imports is sold to native buyers at weekly auctions. The goods thus purchased at auctions find their way into the interior and to various treaty ports of China. The Shanghai piece-goods auctioneers are all British and deal mostly in British shirtings, sheetings, jeans, T cloths, fancy cottons, etc. These auctioneers charge a commission of 1 per cent, to which are added incidental expenses, such as advertising, insurance, cartage, storage, etc. Practically no American cotton products are sold in this way."

Obviously, it is a disadvantage to American exporters of cotton goods to China, whether these be merchants or the manufacturers themselves, that a custom which finds favor in the chief Chinese distributing markets should not be practicable for American goods. It is not to be expected that a class of auctioneers exclusively English, whose banking and commercial affiliations are naturally also English, should be satisfactory intermediaries for the disposal of goods competing with English goods. A comparatively simple remedy for this difficulty, however, would be co-operative action on the part of American exporters to China, looking to the development of auction sales of American goods, in Shanghai and other Chinese ports, through competent American auctioneers.

In conclusion, some idea of the conditions obtaining at the present time in China, in respect both of the facilities for the interchange of goods, whether cotton or other, between the United States and China, and also of the commercial conditions resulting in China from the European war, may have its value for such of our cotton manufacturers as are seriously studying what may be done towards the development on a larger scale of this outlet for their products. With regard to these matters, Mr. Sammons reports as follows:

"The available American shipping facilities at Shanghai contemplate the movement of a large part of the outgoing freight now offered (Sept. 15, 1914). To these more bottoms may be added. For the time being the utilization of Japanese and British vessels for Government purposes tends to curtail available tonnage; but with the export trade retarded by a lack of confidence and further hampered by the withdrawal of the usual banking accommodations, the immediate demand for ships is neither as great nor as urgent as it will be once normal trading conditions obtain. With ample American shipping available the direct freight-forwarding business from China to the United States would increase very rapidly.

"Freight rates on goods destined for the United States remain unchanged, as a rule, regardless of the war in Europe. Prior to the war the leading shipping interests had abolished all rebates by mutual agreement. At present marine insurance on neutral ships is 1 per cent and on British and Japanese ships 2 per cent, plus one-half of 1 per cent for the general average rate.

"While there is at present an abundance of money in the Shanghai banks, they are endeavoring to keep their resources in as liquid a state as possible, and are, therefore, more than usually cautious in financial operations. The usual practice of purchasing one, two, three and four months' drafts has been largely discontinued for the present, and the banks are not attempting to finance shipments for any but their old, regular clients.

"A disadvantage under which the banks are now laboring is that silver quotations from London give the bare selling or purchasing price, with no reference to the cause of fluctuations either way. Consequently, the Shanghai banks are unable to form an opinion as to the general tendency of the money market, which is one of the principal reasons for the timidity displayed. However, it is quite possible for merchants, by means of letters of credit established in the United States, to obtain money upon shipments of cargo from Shanghai to America.

"As there is a United States postal agency at Shanghai, payment for goods received from America can be easily arranged by means of post-office money orders. The United States postal agent, having been asked for a statement regarding transactions of this kind, has kindly reported as follows:

"'In reply to your memorandum relative to remitting moneys for goods purchased in the United States, I would say that it has been the custom for Americans and other nationalities to forward Chinese money orders to this agency to purchase American money orders, and forward same to the United States in payment for their purchases. As you are aware, the rate of exchange fluctuates daily, and the purchaser of a money order usually remits more than the necessary amount in Mexican dollars to cover the cost of a money order in gold dollars. In all such cases the difference is returned to him in United States postage stamps.'

"There are at present in Shanghai—which port handles upward of 43 per cent of the foreign trade of China—a number of American importing and exporting houses that undertake to cater to any and all new business. The managers of these houses feel, as a rule, that they may be depended on to take advantage of such trade opportunities as arise from time to time. Some of these firms have connections in the United States.

"At other ports of China, notably Canton, Tientsin, and Hankow, American trading concerns may find it to their advantage, having in mind the present situation, to investigate conditions with a view to making such commercial arrangements or connections as may seem warranted. As a general proposition, further commercial activities in China should not be of a makeshift nature, a mere seeking for emergency markets. Permanent trade should be sought; and with suitable business investigations on the spot and resulting satisfactory trading connections, the present situation offers inducements worthy of careful examination."

Only one remark need here be made upon these statements of Mr. Sammons. It is that the extreme closeness of modern competitive commercial calculations makes the use of the postal service, either American or other, quite out of the question for remittances or reimbursements. Banks, and banks alone, suffice for this service.

THE MARKET WORLD AND CHRONICLE in the course of a year gives its readers authoritative signed contributions upon every large question in the insurance world, and is a thorough commentary on finance, commodity markets and international trade

INSURANCE DEVELOPMENT IN THE AUTOMOBILE FIELD

(Continued from Page 692.)

minum $12.50, and 1½ per cent for fire only, minimum premium $7.50. On older cars the rates are 3¼ per cent for fire and theft, minimum premium $12.50, and 3 per cent for fire only, minimum premium $10.

The rate on electric cars, used for pleasure and commercial purposes, is reduced from 1½ to 1¼ per cent, and when the theft and automatic features are eliminated the rate is 1 per cent, minimum premium $10.

If it is warranted that an approved fire extinguisher shall be carried on the car the assured is entitled to a reduction of 15 per cent in the fire and theft premium.

What we need to know in this business, more than anything else, is the combined experience, for several years, of all the companies and of Lloyds with the perils insured against. A universal classification system of premiums and losses should be adopted and the business classified back as far as possible. The results could be furnished to disinterested parties, and they, in turn, could supply compiled statistics to a committee of automobile underwriters, who would then be in a position to intelligently formulate a schedule of rates that would have some merit, which is more than can be truthfully said of the present system.

In the Chicago territory the minimum and maximum premiums for public liability on private cars propelled by gasoline are $32.50 and $103.50 respectively. The premium in each case is based upon the insurable horsepower of the car covered. Practically every car on the market has an advertised and an insurable horsepower and, for obvious reasons, the former is almost invariably greater than the latter. The term "insurable horsepower" denotes the actual horsepower which a motor is capable of developing, and is determined by the size of the bore of the cylinders and the number of the cylinders. The premium for any horsepower up to and including 16 is $32.50. This premium increases at the rate of $4 for each additional horsepower up to and including 20. It then increases at the rate of $3 per horsepower up to and including 25; $2 extra per horsepower up to and including 30, and $1 extra per horsepower up to and including 60, where it reaches the maximum premium of $103.50. The liability premium for private electrics and motorcycles is $22.50.

Prior to May 1, 1914, the premium for $1,000 property damage insurance on private gasoline cars was exactly one-fourth of the premium charged for public liability insurance in each instance, except that the minimum premium for this coverage was $10. Since that time, however, the liability premium has been reduced $2.50 for each horsepower, but the property damage premiums remain unchanged. Therefore, if we will add $2.50 for each liability premium, and then take 25 per cent of the total, we will have the correct charge for property damage feature, provided it amounts to $10 or more. $10 premium for property damage in connection with private electrics and motorcycles is $7.50.

The following additional charges are made for coverage outside of the limits of territory named in liability policies:

For liability alone	$50.00
For liability and property damage	62.50
For liability, property damage and collision	100.00

The premiums for public liability on such vehicles are as follows:

For each horsepower up to 3	$150.00
4 horsepower	167.50
25 horsepower	185.00

Five dollars extra for each horsepower up to and including 30; $2.50 additional for each horsepower up to and including 60. Maximum premium, $265. Electrics, $62.50.

The cost of property damage insurance on all livery vehicles is exactly three-tenths of the premium charged for public liability on the same class of cars.

The annual charges for collision sustained insurance on livery vehicles are 20 per cent more than the premiums for private pleasure cars.

On public automobiles other than livery cars the premium runs from $350 to $600 for liability insurance, and from $105 to $180 for property damage insurance, according to the use of the car and the number of passengers carried.

Collision sustained insurance on this class costs 4 per cent of the manufacturer's original list price, plus cost of extra equipment.

Commercial automobiles are rated for public liability at from $60 to $250 per car, and for property damage at from $24 to $100 per car, according to the use of the car.

Fire patrols, ambulances, factory and dock trucks are rated at from $30 to $500 for public liability, and from $4 to $200 for property damage, per car. Collision sustained insurance on this class is figured at a rate of $2.40 per $100 of manufacturer's list price, plus cost of extra equipment.

Manufacturers' and dealers' cars are rated for public liability and property damage on two different plans, viz:

Named chauffeur or specific car basis and payroll basis, and when a private car is occasionally used for livery purposes, it takes the liability and property damage charges for named chauffeur or specific car basis of manufacturers' and dealers' cars, plus 100 per cent additional. Manufacturers' and dealers' cars may also be rated for public liability and property damage, according to livery or commercial livery earnings, the rates being $5 per $100 of livery earnings for public liability and $1.50 per $100 of livery earnings for property damage and $3 per $100 of commercial livery earnings for public liability and $1 per $100 of commercial livery earnings for property damage. For collision insurance this class takes a rate of $2.40 per $100 of manufacturer's original list price, plus cost of extra equipment.

It will be observed that flat premium charges are made for collision and property damage insurance, the practice being to charge the same premium every year, regardless of the amount of the policy. At first glance this rule may appear to be inconsistent, but it must be remembered that the partial loss liability increases with age and thus offsets any advantage that the insurers might have by reason of a diminishing total loss liability. In the event of a partial collision or property damage loss to an old car, it is difficult, in many instances, to secure depreciation, and quite impossible for the adjuster to determine the value of the parts destroyed by the accident; therefore the assured, or the owner of the damaged car, receives the benefit of the doubt by having the damaged or destroyed parts replaced by new parts, the same as would have to be done if the car were new. Consequently there is an element of fairness in charging the same premium for these risks every year.

If all the cars in the country were insured for their full value against fire and theft at an average rate of about 2.81 (which would be the average schedule rate), they would yield an annual premium income of $56,200,000. If we assume the average cost of these cars when new to have been $1,500 each, the premium for collision insurance would yield $15,000,000 more. There is no way to calculate the average horsepower, but, assuming the average to be 42 horsepower, the returns for liability and property damage insurance of $1,000 in each case would aggregate $103,125,000 per

annum, making a grand total of $204,325,000 per year. These estimates are all based upon private car rates and, if we make a reasonable allowance for the higher rates charged for public and commercial vehicles, we can easily place the total premium income at $250,000,000 per annum.

An important matter that should receive the earnest consideration of automobile underwriters is the question of more stringent laws against careless operation of cars. Chauffeurs, and even owners of cars who do their own driving, should not only be licensed, but should also be compelled by law to make reports of all accidents to the authorities on blanks provided for that purpose. If the driver of a car should have two accidents in one year for which he cannot account to the authorities in a satisfactory manner, he should be prevented from receiving a renewal of his license, and if he has more than two accidents his license should be revoked. Such a law would not only reduce collision losses to property, but it would also prevent many fatal and non-fatal accidents to persons.

For a period of ten years both the fire and liability companies doing an automobile business in Chicago had no alternative but to pay to dealers and repair men the outrageously high prices exacted for rebuilding and repairing motor cars that had been damaged by fire, explosion and collision. The adjusters and agents knew that the companies were being charged unjustly, but were powerless to prevent it. In September, 1911, after several futile efforts had been made to induce the agents writing automobile insurance to start an underwriters' repair shop, two agents—one representing a leading liability company and the other a leading fire company—and three adjusters organized what subsequently became known as the "Insurance Shop." They rented about 4,000 square feet of space and fitted it up in an unpretentious manner, and from this humble beginning, a shop of 60,000 square feet, employing nearly 100 men during the busy season and capable of handling 100 jobs at a time, culminated within eight months.

The invoice cost of the insurance work done by this shop within a period of two years aggregated nearly $200,000,000, and exceeded the most sanguine expectations of the promoters. The work was all done at a minimum profit, and the profit was all absorbed in the expansion of the plant which became necessary to take care of the ever-increasing business.

This enormous growth called for considerably more capital than the promoters were able to furnish and an effort was made to induce the companies which were directly benefitted to come to the rescue. Unfortunately, insurance companies are prohibited by law from investing in enterprises of this kind, and, as the organizers were unwilling to place the control outside of insurance hands for fear of losing the advantages gained, which were and would have remained on the side of the companies almost entirely, the venture failed, resulted in a financial loss of approximately $15,000, to say nothing of the loss of time and energy to the promoters.

In compliance with a rule of this shop, established at its inception, an estimate of the cost of repairs was procured from some reliable outside source on nearly every job done, and a comparison of these estimates with the shop bills rendered, revealed the startling fact that they were on an average 40 per cent higher, showing that the insurance companies saved about $133,000 as a consequence of patronizing an institution in which neither they, nor their agents generally, had any financial interest.

It is usually difficult, if not impossible, for an owner to identify a stolen car, especially a Ford car. A thief will, almost without exception, either change the motor number or eliminate it entirely and will so disguise the car in other respects as to make it impossible of identification. For this reason companies are frequently compelled to pay theft losses. In order to prevent this unnecessary outlay of money, the manufacturers should place some secret mark of identification upon every car made and thereby facilitate recovery in case of theft.

The manufacturers should also, in co-operation with the automobile conference, number their engines and chassis consecutively, and the conference should print in the official list price book the beginning numbers of each year's model. This would prevent misrepresentation as to age of car and insure proper depreciation when effecting insurance and making loss adjustments.

The Automobile Protective and Information Bureau, a Chicago organization, covering the entire United States, but more particularly the Western Union Territory, has been in existence since September 5, 1912, and is composed of thirty of the leading American and foreign companies. The record of this bureau shows that during the first year of operation forty-seven stolen cars, with an insurable value of $57,500, were recovered, and that convictions were secured in nineteen cases—four different organized gangs of automobile thieves having been broken up and the leaders having been sent to penal institutions.

The cost of this service to the members of the bureau was only $1,309.09, of which the secretary's assistant received the meagre sum of $300.

The record of this bureau for the second year was as follows:

One hundred and ninety-eight cars were reported stolen, and 114 cars, insured for $123,767, were recovered. Of the 84 cars missing at the end of the second year, 62 were Fords. The expenses of the bureau for the second year were only $1,290.88.

Early in October of this year, the bureau was instrumental in securing the conviction of the ringleader of one of the most daring bands of automobile thieves in the Middle West. This man is now serving a term of fourteen years in the penitentiary.

This bureau is conducted by three officers and four directors, all of whom render their services gratis for the good of the business. Too much cannot be said in praise of this organization. Its work speaks for itself. Every company writing fire and theft insurance on automobiles in the United States should, for selfish reasons if for no other purpose, be affiliated with this bureau and support it financially. Its officers and directors are untiring in their efforts to trace stolen cars and to apprehend and cause to be prosecuted the automobile thieves.

The Western Automobile Conference—an association of practically all the leading fire insurance companies writing automobile insurance in Western Union Territory, and conducted by the leading insurance managers of the West—is an organization which seeks to establish and maintain, except in States where prohibited by law from so doing, correct practices in the conduct of this important and rapidly growing branch of the insurance business. The work of this conference should have the hearty approval alike of the insuring public, the insurance commissioners of the various States, and the insurance companies. Its members are all trained in the business and are keenly alive to the necessity of co-operation with the insuring public—to the end that both interests may work in mutual harmony—and thereby make possible the fullest measure of indemnity consistent with safeguarding the solvency of the companies, which at all times, but at this time particularly, is so essential to the welfare and credit of the nation.

INSURANCE NEWS IN THE WEST

Successful Organization of Iowa Insurance Federation. The Insurance Federation of Iowa is getting that State splendidly organized, according to W. S. Diggs of Cincinnati, who spent two

*Holiday.

weeks in Iowa. A number of successful meetings were held in various parts of the State, at which Mr. Diggs and prominent members of the federation made speeches against the State fund monopoly of workmen's compensation insurance, which Industrial Commissioner Garst is advocating. The newspapers gave much publicity to these meetings and this helped stir up interest among insurance men who were apathetic. The State has been organized by districts, each with a president, vice-president and secretary and an executive committee consisting of a member from each county in the district, all under the general supervision of the State federation officers.

To all appearances the insurance interests will be better prepared to look out for themselves when the next Legislature convenes than ever before. The big fight is expected over the State fund insurance plan mentioned. It is understood that Senator Clarkson will lead the fight for the State fund. He drafted the bill which, after many amendments, became the present law. He was strongly inclined towards the State fund plan at that time. He was at one time a coal miner. Then he studied law and has handled much litigation over personal injuries both as plaintiff's attorney and as attorney of insurance companies. He is a man of force and influence, especially among the coal miners, who constitute an important element in Iowa. Not only is Industrial Commissioner Garst speaking in favor of his proposed plan, but men from Ohio in sympathy with the programme of Governor Cox are at work in the State on similar lines.

* * *

The Fire Insurance Companies and the War Tax.—Plans of the fire insurance companies to collect the emergency stamp tax from the assured became considerably upset within a few days past. The Michigan department ruled that the companies could collect the tax from the assured only as a part of the premium and not as a separate item, as the Michigan law forbids the collection of any fee in addition to the premium named in the policy. The department holds that the agent may not pay it, as that would constitute a rebate. The Wisconsin department also made a ruling adverse to the companies' plans. The local agents at Chicago, Milwaukee and St. Louis made protests. Arthur Hawxhurst, insurance manager of Marshall Field & Co., protested against the companies calling on assured for the tax. He said if the companies would cut down their selling expenses, do better underwriting and more careful adjusting they would have enough to pay the tax and leave a margin.

Work to Improve Contract Bonds in the West.—For some time past there has been agitation in parts of the West for improvement in the form of contract bonds offered by architects and engineers to the surety companies. The Kentucky Surety Underwriters' Association of Louisville has done perhaps more in this direction than any other body, securing the co-operation of architects and contractors and working some valuable reforms. Now the Milwaukee association has taken the subject up. At Cleveland the surety men tackled the question from the standpoint of rates and secured the co-operation of city and county officials in securing the adoption of a form of bond under which the surety does not become liable to material men and laborers, thus keeping the rate at 50 cents instead of $1, the rate which would have been required for the old form of bond. In Chicago the surety men, architects and contractors held some conferences on bond forms some time ago and it is proposed to take the question up again in the near future, as some of the architects' offices have forms which are objectionable to the surety companies.

* * *

Question Constitutionality of Texas Compensation Act.—A strong effort is being made to get a Supreme Court decision on the constitutionality of the Texas compensation act before the Legislature convenes, so that that body can correct defects if the court should point any out. A number of cases raising points of constitutionality are in the lower courts of the State, but one of them, docketed to come before the Court of Civil Appeals this week, will be rushed forward if possible. It is understood the Court of Civil Appeals has declared its willingness to certify the case directly to the Supreme Court without passing upon its merits itself.

Whatever the decision of the Supreme Court may be on this case, however, a number of changes in the law will be recommended. The Industrial Accident Board will not make its report until next week, but the Insurance Commissioner already has made his. He desires that certain provisions be harmonized and others be made clearer. He also asks for a liberal appropriation for a merit rating system with a view to more adequate inspections for rating purposes and penalizing bad risks and giving good ones due credit for their excellencies.

* * *

Fight Expected on Ohio Compensation Amendments.—As the time for the session of the Ohio Legislature approaches, it is recognized that amendment of the compensation law is a delicate undertaking. While a committee appointed by the Industrial Board is examining the act and its operation to learn whether improvements can be made, certain interests, especially labor, are fearful about the way amendments may be offered lest they give opportunity for other changes not desired by these interests. The Ohio Industrial Commission has looked after publicity so well that apparently many of the citizens of the State believe that the benefits of workmen's compensation are inseparably connected with the State fund monopoly of insurance. Boldly to set forth to revise the compensation law itself would meet with strong opposition and possibly stir up unnecessary antagonisms. On this account there has been talk of undertaking changes by separate bills, so that each important proposition can be fought out on its own merits without involving other features of the law.

Things and actions are what they are, and the consequences of them will be what they will be; why then should we desire to be deceived?—Bishop Butler's Sermons at the Rolls.

MR. SAMUEL REA, President of the Pennsylvania Railroad Company, in his address delivered before the New York Chamber of Commerce on Thursday of this week, and printed on other pages of this paper, made the illuminating and, as we believe, just remark that: "Failure in the last decade to protect the railroads and railroad investors has at last produced a lack of confidence in public regulation; and we now know that, through the weakness of the railroads, the whole country is suffering." It was, however, in no spirit of antagonism to the principle of public regulation of the railroads that Mr. Rea said this, for the concluding paragraph of his address was as follows:

"I believe in regulation by commission, and I urge, therefore, that we do not encourage destruction of such regulation, but rather its conservation, by adapting it, as we have banking regulation and other laws, to suit the needs of the country as they change from time to time. We must look beyond the present obstacles and view the whole subject from the statesman's standpoint. Under an enlightened policy of public regulation, but not repression, the railroads will be placed and kept in a strong position to meet increased traffic demands, as well as to live healthfully in times of depression. If we now by equitable dealing ensure their strength, one of the greatest obstacles to the recovery of financial confidence and business enterprise can be removed."

Three weeks ago, in discussing in these columns what we believe thinking Americans desire and expect from the Interstate Commerce Commission in the matter of the reopened five per cent rate increase case, we were led to describe at some length the tendencies of the enlightened public's reasoning upon the matter, as we observe these tendencies; and by reason of the consonance of what we there said with Mr. Rea's intimation, we venture to quote the following passage from ourselves:

"It appears to us to be a manifest fact that the case of the railroads is, so to speak, 'getting away' from the Interstate Commerce Commission. Ingenious as their decisions have been of late years in arraying plausible reasons for their course, that course began, at least as early as two years ago, to meet with only half-hearted approval from the thinking part of the American public; and more recently no small part of this public has ceased to approve at all, having become more and more impatient with the Commission's apparent lack of ability to determine great matters upon those grounds of the larger good of the community, which keep questions of detail, perhaps deserving attention yet relatively insignificant, in proper subordination to the main issue. We do not think, for example, that the informed public was pleased or satisfied by either the method or the manner of the previous determination of this very case of the five per cent rate increase. It had been borne in upon the public mind, not by reason of the arguments of railroad officials but because of the great aggregate of financial and economic facts about railroads which the public could see for itself, that the time had come for one of those root and branch decisions which the great leaders of business must from time to time make at a stroke, because of a perilous juncture which has come about. It was a time for disregarding detail, postponing it to a more appropriate and convenient occasion. But the Interstate Commerce Commission dwelt only upon detail, turning it this way and that, endeavoring to combine it into a coherent whole, allowing it to obtrude itself as the main matter; and in consequence the real question was not considered or passed upon, except feebly and ineffectively, although the Commission's decision had the practical effect of determining it for the time being. The intelligent public, we believe, saw this; and, as has been said above, it was not pleased."

It is an interesting and highly important fact that for the first time in a quarter of a century,—indeed, for the first time since its creation,—the Interstate Commerce Commission is itself actually at the bar of public opinion; and that a multitude of persons are beginning to say that the Commission, just as much as the railroads, must be judged by its works. Until recently, it is safe to say, the Commission has had little to fear from the public at large. Virtually its only critics have been the immediate representatives of the railroads, whose frequent chafing at the acts of the Commission has inspired comparatively little sympathy in the generality of persons in the country. Even the real owners of the railroads, the investors in their stocks and bonds, have been decidedly lukewarm in their adherence to the contentions of the managers of their properties, feeling that no great amount of harm could result even for them, from a powerful curb upon the will and the ambitions of these masterful personalities. Then, too, the whole tendency of the times has been in the direction of imposing some form of governmental restraint upon the free activities of all those who have come, in whatsoever manner, to have in their hands the control and direction of economic services of prime importance to the community. The doctrine that whatever is

prima facie "affected with a public use or service" must not be left to the judgment and initiative of mere individuals, but must somehow be brought within the circle of governmental activities, has grown to vast, though often unconscious, influence over the minds of a majority of Americans. Reliance upon the inexorable working out of fundamental laws of human relationship in a free society, so that in the long run abuses are relieved and justice is attained, has been greatly impaired, and to a large extent lost altogether. Hence what may be called the social impulse, reflected in legislation, has been all towards exaggeration of the authority of what is conceived to be the Government, meaning thereby not a sovereignty of general laws faithfully executed according to their terms by executive officers and courts, but an extensive system, or hierachy, of public officials endowed with a discretionary authority reaching far beyond any specific provisions of law. In pursuance of this theory there has seemed to be no end of the creation of commissions or of the lifting of departments of the Government from the plane of pure executive function to that of the function of commissions. Whenever the legislature, whether National or State, has undertaken to deal with a matter of large public interest, its immediate inclination has been to constitute a new commission, by name or in fact. And through it all there has been singularly little scrutiny of the actual accomplishment of the commissions thus created. Have they, as a rule, rendered the service expected of them? Have they shown a superior capacity in dealing with the matters entrusted to them? Have they worked constructively and creatively for the public good? Are the great departments of affairs in which regulative authority has been given them displaying a deeper vitality and a higher efficiency than when they were uncontrolled and unregulated? These are questions which the community at large, up to a very recent date, has scarcely asked at all.

On the face of things, the principle of discretionary and personal public regulation of the economic concerns of society is to-day in the hey-day of its success; the substitution of a government of men for a government of laws in this country has never appeared nearer to complete realization. Not only are new realms of business being continually subjected to the authority of governmental commissions or of executive departments of the Government, but the powers of the older commissions are being confirmed and enlarged. The Interstate Commerce Commission, for instance, has never in its whole history possessed and known that it possessed such powers as it has at this moment. Congress has now given it virtually a free hand to deal with the common carriers of the country as it will; and practically the last doubts and uncertainties in respect of the right of Congress to do this, and in respect of the plenary and sovereign character of the powers delegated to the Commission, have been resolved by the Supreme Court decisions in the Shreveport Rate Case and the Intermountain Rate Case. As things now are, the Commission may work its will with the railroads; it may adopt its own conception of their position and function in the body politic, and it may stretch them on the Procrustean bed of that conception, amplifying or diminishing the place they occupy in our economic life as it pleases. It may be that the conception adopted is that suggested by Mr. Rea, in his address. "The inherent weakness of the present situation," Mr. Rea said, "is that we as a people seem to have assumed that the present railroads and their equipment and facilities are complete, and are sufficient for present and future needs, and that the chief function of public regulation is to curtail their revenues, increase their expenses and lessen the margin of return." If it be true that the Commission takes this view of the matter, there is no doubt that it can, for the time being at least, bring the railroad policy of the country within these lines. Then the superb and in the main socially beneficent ambitions of our railroad managers will be checked; our pride in the continuous achievements of these managers will be quenched; our gratification in the unmatched service of our railroads will die away; and our railroads will, once and for all, be removed from the characteristically American realm of eager invention, ambitious rivalry in accomplishment and strenuous effort to make each day's record of improvement surpass the record of the previous day.

The Interstate Commerce Commission, we say, has the power to adopt such a conception of our railroads as has just been described, and to put it into effect. But the very fullness of this power is now the greatest danger to which the Interstate Commerce Commission is itself exposed. Whatever may be the superficial aspect of the matter, the American people has not the slightest intention of having any such policy adopted. It is by reason of the suspicions which the Commission has aroused that its thinking is along these lines, that the impatience and doubt about the worth to the community of the Commission itself, of which mention has been made, have begun to manifest themselves. We are ourselves surprised at the number of persons we meet, —neither railroad officials nor even investors in railroads,— who would be very far from agreeing with Mr. Rea, when he says: "I believe in regulation by commission, and I urge, therefore, that we do not encourage destruction of such regulation, but rather its conservation, by adapting it, as we have banking regulation and other laws, to suit the needs of the country as they change from time to time." Many of the persons to whom we refer have already in their own minds given up the Interstate Commerce Commission, as inherently detrimental to the larger public good, as necessarily an impediment to the effective development of our railroads in the public interest, as inevitably tending to a gradual destruction of those fruitful energies in the construction and management of our railroads, which have made them, despite every fault and abuse that ever has been or ever can be alleged, the most remarkable servants of the general welfare of the whole nation of whom any record can be found in this or any other country.

We said three weeks ago, and we say again to-day under the impression of Mr. Rea's address: "It is a condition precedent to the provision by our railroads of the service which the country requires of them, that they should be incessantly enlarging and developing, hiring or otherwise obtaining new capital and investing it in their properties, reaching out in new directions with all their facilities, continually devising and providing new means of usefulness. The mere increase of the population and of the business of the country would in any case make this necessary; but there is a further reason, inherent in the deep springs of all human activity. It does not lie in human nature for men, (and railroads after all must be operated by men), to be genuinely efficient and serviceable in businesses which no longer progress, which have reached their ultimate develop-

ment and afford no prospects of still greater successes in the future."

This is the great general truth with regard to the situation of the railroads of the United States; and all else is subordinate detail. The measure of the worth of the Interstate Commerce Commission to the country is its capacity to recognize this and to act upon it. It will be judged by its deeds in this regard. The over-riding consideration is that everything must be bent to the attainment of the ends described. In comparison with these ends all else is trivial. It is of no consequence whether or not freight and passenger rates are higher than this or that class of shippers, or this or that community, likes to pay, provided these rates have become, through the operation of world-wide economic forces, necessary for the maintenance of that energy, that resolute reaching forward to new achievement, that multitudinous rivalry in providing the country with its every need in the way of railroad service, which have characterized the builders and the managers of our railroads in the past, but which unhappily have shown some signs of diminution in recent years. If the Interstate Commerce Commission can see this, it may serve us well and maintain itself in the public esteem. If it cannot see it, there will, we believe, be no escape from the consequences of an ever growing public impatience and disbelief.

Arthur Richmond Marsh

THE FEDERAL RESERVE SYSTEM AS ESTABLISHED AND IN OPERATION

By Hon. Charles S. Hamlin*
Governor of the Federal Reserve Board

NOW that the reserve banking system has become established, and the Federal Reserve Banks have opened their doors, it may be profitable to look back and consider what an advance has been made by the new system.

Under the old system, there were approximately 7,500 National banks, each with its separate reserve and each independent of every other, the only interdependence being that arising from the deposit of reserves in other banks of the system,—an interdependence of danger rather than of strength.

Under the old system, when a bank discounted commercial paper, it tied up its funds, the investment being to all intents and purposes as dead as if buried in the ground until it came to life again at the time of maturity. If any bank, pressed by necessity, should, metaphorically, take this note up from the grave and rediscount it before maturity, such an act, if done openly, would tend to raise suspicion of the solvency of the bank.

The result of the old system was that in times of unusual, even though normal, demand, the banks needing more credit to assist trade and commerce had to rely on their own credit unassisted by that of the business interests of the country, although the latter constituted the safest and broadest basis for credit in the world. The old system, in short, separated entirely the credit of the borrower from that of the bank.

So, also, under the old system, a bank, to keep possession of liquid assets which it could turn quickly into cash, was compelled to place its money on call loans, to be loaned on stock exchange security, as such loans could presumably be called in speedily. Even this practice, however, did not always bring the required amount of money into the banks, as in times of great stress, the loans could not be called; and as a result practically all the resources of the banks would be tied up in non-liquid securities, as we saw in the recent disturbances in our financial markets, growing out of the European War.

In other words, the liquidity of credit, under the old system, was the stock exchange loan; and as the legitimate trade and commerce of the country is infinitely greater than the speculative transactions upon the stock exchange, the result was an inverted pyramid, the apex of which was never stable. When money was idle, it rushed into the call loan market and was poured into the stock exchanges. When, on the other hand, there was need of expansion, it was at times difficult to withdraw this money from the speculative markets without affecting injuriously all our securities.

As a result, even the normal seasonal demands for cash and credit created acute strain, and at times when we were enjoying the benefits of splendid crops and great prosperity, we learned to our cost that the greater the prosperity, the greater the strain upon our banking system, resulting in high charges for the use of credit or money, thus injuring the whole trade and commerce of the United States.

Under the old system, still surviving for the time being, we had National bank notes as a basis for currency. These notes were chained to Government bonds. While this system of note issue permitted expansion, such expansion could only be accomplished by new issues of Government bonds generated from the necessities of the Government. In other words, under the old system, National bank notes, issued to help trade and commerce, were linked together with Government bonds, the evidence of the destruction of trade and commerce during the Civil War, the Spanish War and other necessitous periods of the Government. Thus the extension of the trade and commerce of the 20th century was linked with the destruction of the trade and commerce of the 19th century. While there may have been some justification for this alliance in the 19th century, there is surely none in the 20th century, and I earnestly hope the method provided in the Federal Reserve Act for retiring these National bank notes may prove efficacious.

The National bank note system, as I have said, is capable of expansion only but responds feebly to any necessity for contraction, even in times when contraction is absolutely needed for the protection of the legitimate trade and commerce of the country. Experience has shown that even when expansion was legitimate and necessary, the response has often been so sluggish that when the expansion of note circulation had fairly begun, the need of it had already passed.

Under the old system, there was no broad discount market. In original discounts, the note broker was an important factor and, as I have pointed out, once discounted, the note remained in the bank vaults.

Furthermore, all eyes were fixed on the rate for call loans; and while in foreign countries a very small increase in the rates would bring to a country capital from all over the world, yet in the United States a rate for call loans of 10, 20, 50 or 100 per cent would have little effect on foreign investors, who well knew that such rates were but manifestations of a disturbed banking condition, rather than of legitimate demands for increased credit facilities.

Turning now to the Federal resrve system, it is easy to see what a change has been effected. In place of the scattered reserves, we have reserves mobilized in the Federal Reserve Banks. In place of bank notes issued by independent National banks, the Federal reserve system has provided notes based not upon Government bonds, but upon the trade and commerce of the United States. In place of fixed discount investments, we see the promissory note and accept-

*Outline of an address before the New York Chamber of Commerce, December 3, 1914.

ed bill based upon commercial transactions leap into life; and what was a fixed investment has become an investment far more liquid than any loan upon stock exchange security. Furthermore, we see the resources of the reserve banks, including all deposits of Government funds, forever pledged to the use of trade and commerce.

And finally, after three years, we shall have a system under which all the reserves of the banks must be deposited either in their own vaults or mobilized in the Federal Reserve Banks, thus taking away from the member banks the dangerous privilege of pyramiding said reserves unduly.

In short, a new system has been established,—a system based upon principles recognized over the world as sound,—upon mobilized reserves, liquid assets and a note issue elastic and responsive to the needs of trade and commerce.

I have noticed some comment upon a remark of the Governor of one of our Federal Reserve Banks recently that the new system will relegate panics to obscurity. I believe this remark was intended to be applied only in a limited sense,—that is, to financial as distinguished from commercial panics. If in the future business expands unduly under the spirit of speculation, the day of reckoning will surely come in the future as it has in the past. Undue expansion will correct itself just as the air bubble will ultimately burst. I believe, however, that the Federal reserve system will materially check undue expansion by making banks conservative as to their loans, because of the knowledge that any departure from strictly commercial transactions will take away their ability to liquidize such investments by rediscounts in the Federal Reserve Banks. It is a fact, however, that even under the Federal reserve system, or to speak more accurately, entirely outside the Federal reserve system, the banks still have it in their power to permit, if not to encourage, undue speculative activity; and if they do this, the inevitable result,—commercial stringency,—must follow. When, however, the State banks and trust companies of the United States join the Federal reserve system,—I hope in the near future,—even that possibility will be greatly minimized.

There is one form of panic, however, which I believe the Federal reserve system will relegate to its proper place, the museum of antiquities,—and that is the panic generated by distrust in our banking system, leading to a struggle for self preservation between bank and bank and individual and individual and, to ultimate hoarding by the people. I say ultimate hoarding by the people, for to my mind such hoarding usually follows hoarding by the banks and does not precede it. It is safe to say that if hoarding by banks should cease, hoarding by individuals would never occur; and both, I believe, will be relegated to obscurity under the Federal reserve system.

No hoarding can be imagined more injurious than the hoarding by banks when they have engaged in this operation in the past. Each bank retreats into its own citadel at the sound of danger and at a time when it should be drawing upon its reserves to help the business man of the community, it stays aloof, piling up reserves upon reserves like Pelion upon Ossa, and the business men have to care for themselves as best they can. Witness the condition of some of our banks during the financial panic of 1907, with reserves of 60 and 70 per cent, although the legal requirement was 15 per cent. Similar conditions could be observed in our recent disturbance growing out of the European War. Many of these banks defended their action by pointing to our defective banking system, and there was some force in this argument; but whether the justification was complete or not, such a state of affairs will never occur again under the Federal reserve system. The mobilization of reserves and the turning of commercial paper into a liquid investment, will enable every bank to draw down its reserves with confidence that it can replace them at will if it has proper commercial paper at its disposal.

The Federal reserve system, as I have said, rests upon sound banking and financial principles. These principles are not new,—they have been recognized for years abroad, and form the basis of the banking laws of many foreign countries. It is only the American people who have failed to recogize them and adopt them in the past; but this recognition has been accorded at last under the Federal Reserve Act.

Among these established principles are: the recognition of the fact that banking is not so much a cash as a credit problem; that the use of cash must be minimized and the use of credit extended; that a sound banking system cannot be predicated on cash alone, and that the more extensively credit is used, under proper safeguards, the sounder the banking system; that reserves should be mobilized so that the freest use can be made of them in times of unusual demand; that commercial paper must be turned from the non-liquid investment into a quick, liquid asset; that commercial paper based upon the trade and commerce of the people is the best self-liquidating asset that can be had; that, as has been so cogently pointed out by Mr. Warburg, my associate upon the Federal Reserve Board, the function of issuing money and the function of making money in banking should be kept separate and distinct in any sound system; that rediscounting institutions, such as the Federal Reserve Banks, should be conducted primarily for assistance to the commercial banks and not for profit, and that the latter should always be secondary to the former; that an open discount market is absolutely essential to any sound banking system.

All of these principles can be found in the Federal Reserve Act. We find there mobilization of reserves; the creation of a discount market; notes issued by the Government through the reserve banks, based upon adequate gold reserves and upon commercial paper; an elastic currency thereby created, which will contract as well as expand in accordance with legitimate demands of trade and commerce; Government influence in administration through the appointment of minority Government directors; Government examination, and Government taxation of surplus profits.

Furthermore, the Federal reserve system has taken for its foundation, not the call loan market, but the trade and commerce of the entire country. It has ear-marked as trust funds for the benefit of the trade of the country the resources of the Federal Reserve Banks, including all deposits of Government funds. Last, but not least, it has given to the Federal Reserve Board, a Government body, general control over the whole system, with power to fix discount rates of the reserve banks, and with power, in case of emergency, of permitting said banks, normally shut off from direct banking dealings with the public, to go into the open market and by purchase and sale of Government securities, and even also of bills of exchange, domestic and foreign, and bankers' acceptances, afford to the public engaged in trade or commerce such assistance as it deems necessary.

Such is the Federal reserve system established by the recent act. No man can say that amendments may not be desirable as to some features of the bill, but all will agree that it is a step, and a long step, in the right direction.

Much speculation exists as to the authorship of the Federal Reserve Act. It was finally presented to the country with the approval of a party caucus; in fact, it may be said to have been party but not partisan legislation. Republicans as well as Democrats voted for its provisions. Its underlying principles, as I have said, were not invented or newly created, but are the result of years of discussion and study. And let me add that your President, Honorable Seth Low, and the New York Chamber of Commerce, have pow-

erfully assisted in establishing these principles. I can say this with confidence, however, that no selfish interests assisted at its birth. I can further state that, beyond those primarily responsible for its provisions,—Mr. Glass and others of the House, Senator Owen and others of the Senate, and the Secretary of the Treasury, there looms up one figure more entitled to the credit for its provisions than any of the others, the man primarily responsible for this piece of wonderful constructive statesmanship,—The President of the United States, Woodrow Wilson.

THE NECESSITY FOR A CONSTRUCTIVE POLICY IN THE PRACTICE OF PUBLIC REGULATION OF RAILROADS

By Samuel Rea*

President, Pennsylvania Railroad Company

ALTHOUGH holding no commission to speak for the railroads as a whole, the seriousness of their present position may warrant an expression of my views on the general railroad situation. I therefore appreciate the fitting opportunity you have given me to present certain suggestions for the consideration of this thoroughly representative gathering.

It is no difficult task to sum up the present railroad situation. We can all see that something is wrong; but no useful purpose will be served unless we can suggest some constructive methods of improving railroad conditions.

Examine, for instance, the Eastern railroads, which reach the centres of the largest population and heaviest traffic of the country, and you will find greatly diminished gross revenues and a still greater proportionate reduction in net revenues; their purchasing powers are stringently curtailed, and their credit has been greatly weakened. This condition arises from causes largely beyond their own control, so that the return earned during the past year upon the money invested in the road and equipment of these railroads amounted to less than 4 per cent. This serious condition is not new, but it is now acute. We have been living on hope at least since 1910, when the downward trend was clearly indicated; how much longer we can exist on that precarious asset, I will not venture to say, except to suggest that it takes more than hope, advice or enthusiasm, or all combined, to pay wages and taxes, provide satisfactory service, pay dividends, and retain a proper credit basis to obtain capital for improvements and extensions.

Increased traffic will not cure the railroad malady; for remember that up to the present all their economies and efficiency, obtained by increased train loads, etc., have been offset by increased costs, wages and taxes. These companies, therefore, need not merely the very moderate increase in rates for which they petitioned the Interstate Commerce Commission, but also all the revenue that can be secured by working out in practice the various other means suggested by the Commission for increasing revenue.

A full consideration of the railroad position and the effects of public regulation must not, however, stop there. Irrespective of any decision in the rate case now pending, whether it be finally favorable (as we trust it will be) or unfavorable, it is evident that the time is ripe for suggestions concerning constructive railroad legislation and policy.

I need not remind you that after agriculture—and what would agriculture be without railroads?—the railroads are not merely the most important industry in the country, but they are also in their essence public institutions performing functions which are by their very nature of a public character. They are owned in part by an army of individuals, actually holding their stocks and bonds, and in part by institutions such as savings banks, insurance companies, universities, hospitals and other philanthropic enterprises, in the welfare of which many more millions of individuals are vitally concerned. These are largely dependent upon income derived from the money they have invested in the service of the public, and rightfully they hold railroad managers responsible for this income. It should be the business of government regulation, not merely to see that the public is properly served by these railroad managers, but also to see that the owners of the properties are fairly compensated, and that their revenues are sufficient to properly discharge their duties to the public. Otherwise the managements of these companies will be prevented from efficiently discharging their obligations to the public and their owners. The railroads must give the public good service, and their operation must be continuous in good times and in bad. Moreover, the railroads of the country pay over $140,000,000 in taxes every year, a sum equal to 5 per cent on nearly $3,000,000,000, requiring over 16 per cent of their net operating revenues. They pay good wages to their own employes and afford profitable employment for the industries which furnish railroad materials and supplies.

But apparently the interests of every one have been safeguarded under public regulation except the interests of those who furnish the money for the public service; and we must protect these investors, upon whom we must rely for future capital. Failure in the last decade to protect the railroads and railroad investors has at last produced a lack of confidence in public regulation, and we now know that, through the weakness of the railroads, the whole country is suffering. Upon this great industry, through the operation of too many hastily enacted Federal and State laws, and through failure to provide and adjust the machinery necessary to enforce these laws by reasonable and practical methods, a mistaken policy of repression has been imposed, which has not permitted railroad charges to increase with the enforced increase in the cost of their operation. This has caused a loss to existing railroads, and has precluded the building of new lines, and the making of needed improvements and betterments on the present roads. The inherent weakness of the present situation is that we, as a people, seem to have assumed that the present railroads and their equipment and facilities are complete, and are sufficient for present and future needs, and that the chief function of public regulation is to curtail their revenues, increase their expenses and lessen the margin of return. In this growing country, the present railroads are far from adequate; and therefore the policy of repression is bound to bring, if it has not brought already, a day of reckoning. Let us not forget that if we expect people to continue supplying their savings for our railroads, present and future, their earnings must continue to be what these investors regard as reasonable and sufficient; and they are not likely to be governed by the opinions of legislators or commissions in this respect. The present policy of repression must be modified and lack of confidence must be removed, or these millions of investors will seek other avenues to utilize their capital.

There are some particular features of the railroad situation, incidental to public regulation, to which I would direct attention.

The railroads are existing under conditions that breed business depressions, because of arbitrary, heavy and frequently unjustifiable burdens imposed upon them by legislatures, State and National; and there are still many wasteful legislative experiments forthcoming, unless the authors discover that the public will not willingly pay their cost. Public opinion is now convinced, I feel, that the railroads are entitled to more equitable treatment under

*An address before the New York Chamber of Commerce, December 3, 1914.

public regulation, and that opinion and your very kind invitation have opened the way for me to offer some suggestions.

The present situation is not the result of premeditated action or of a clearly defined punitive public policy; it is the result of our failure to fairly adjust our national conception of the rights and duties of these common carriers, and to adapt our new laws for public regulation to rapidly changing commercial and financial conditions. It is not, therefore, a case for mere sterile criticism, but for mutual study and co-operation, to the end that the evils now existing may be clearly recognized and corrected. The public, the railroads and the commissions, State and Federal, should unite in an effort to ascertain and finally establish the principles upon which wise regulation should hereafter proceed, so as to retain for the people at large the advantage of our American system of private ownership and operation under public regulation, and avoid being forced into another system far less desirable in a country such as this.

Can it reasonably be contended that any large and important business enterprise, whether individual or corporate, could be successfully conducted, if, notwithstanding radically changed conditions and substantially increased costs of production, it could only increase prices subject to the power of an administrative body which on its own initiative and without a hearing might suspend the increased prices for an extended period? Under the existing Federal law, increases in railroad rates, no matter how reasonable or justifiable, may be suspended without any hearing, for at least four months after they would have become operative. In practice, this means five months after the rate schedules are filed with the Commission, and the suspension may be extended by the Commission for a further period of six months. It is, therefore, possible even if the new rates are justifiable, for the railroads to lose nearly a year of benefit from them, while the Commission is determining their reasonableness. Is the public welfare promoted thereby? From practical experience and in a spirit of fairness and justice, I should say it is not; and the period of such suspension and of the determination of the question at issue, ought to be restricted to sixty days after the date of filing new rate schedules with the Commission.

Another trouble in the present situation is that the Interstate Commerce Commision has been over-burdened with work and with responsibilities, many of which must be deputed to a large corps of subordinates, so that in many instances direct consideration by the entire Commission is impossible. The work of the Interstate Commerce Commission, as originally designed in 1887, was to prevent unjust discriminations in rates or service, to see that rates were reasonable, to secure publicity of railroad rates and practices, to prescribe uniform railroad reports, and primarily to act as a referee between the public and the railroads. The Commission was given limited, but well defined, powers within reasonable scope. Now, however, as the result of new laws, the scope of its control of railroad operations and development has been largely extended. It could materially assist railroad development; but so far it has proved impossible for seven men in one centre to act, not merely as regulators, but as administrators of the railroads, leaving the financial results and the responsibility of that administration to be borne by the companies and their owners.

There is also a certain amount of disagreement between the Federal and State laws and orders of commissions, and of failure to recognize the inroads on railroad revenues of new laws, orders and governmental awards.

Let me use just one example of the commercial chaos resulting from such conflict. The recent difference in the views of the Interstate Commerce Commisison, on the one hand, and the Public Service Commission of New York, on the other, in connection with the allowances to industrial railroads, has, during the last eight months, resulted in freight rates, via the lines of the New York Central (whose route is intrastate) from one of the large industries at Buffalo to New York City, and to other places on its line, lower than via any of the other trunk lines, as their routes between Buffalo and New York are interstate; and there was nothing that the other railroads could do to meet this situation, injurious as it was, not only to themselves, but also to industries local to their lines. The same situation, arising from the same cause, existed in the State of Pennsylvania, as between the Pennsylvania Railroad Company and other trunk lines. These differences must be reconciled for the welfare of the public and of the railroads.

In the practice of public regulation, from the constructive side, I would at this time suggest:

First.—That the Interstate Commerce Commission should be materially increased, and so organized as to be able to deal promptly with the very important railroad questions affecting all parts of this large country; and thus conserve the time and energy of railroad officers, the public and the Commission. The additional members of the Commission should be selected from men having experience in railroad management, operation, traffic and finance; and if men of broad business experience were also added, it would be very helpful.

Second.—That the Commission should be placed beyond political influence, by a long tenure of office, and with compensation sufficient to attract and retain men of the widest experience and greatest ability. We recognize the necessity for men of this character and technical experience in dealing with banking and other broad business enterprises, and we must recognize that equally wide experience is just as essential to deal intelligently and wisely with the railroad problems.

Third.—That the regulatory power of the Interstate Commerce Commission should be clearly extended to the supervision and control of all rates and practices which directly, or remotely, affect interstate transportation or commerce.

Fouth.—That the Interstate Commerce Commission should be given the power to interfere, by appropriate action, whenever necessary to maintain a rate structure approved by or satisfactory to it, even though, to accomplish this, it should be necessary for the Commission to prevent reductions of rates which would have a contrary effect, or to compel advances of rates found by the Commission to be unreasonably low. An unreasonably low rate may be beneficial to some one or more shippers, but the rates of some other shippers are sure to be disadvantageously affected thereby.

Fifth.—That for the existing repressive policy of public legislation a conservative policy should be substituted; and existing legislation should be so modified as to permit the railroad companies to do their full share in the development of the country's resources. It will naturally follow that the Commission should be enabled, and indeed required, in the determination of questions involving railroad rates and practices, to deal with the questions before it, not merely from the standpoint of the shipper and the carrier, but from the larger standpoint of the entire country, and on such economic and business lines that due and controlling weight may be given to these larger interests essential to the public welfare. Such a change in public policy and legislation is requisite to encourage the investment of private capital for railroad extensions and additional facilities.

For instance, I seriously question the practical utility of railroad valuation, for I believe that very few railroads are overcapitalized, and I know the public is not required to pay higher rates on weak roads than on the more conservatively capitalized

railroad lines. Therefore, while the railroads are cordially and fully co-operating in the work of Federal valuation, yet under present conditions and when economies are being enforced everywhere, I look to the Commission, under such an equitable public policy as I have in mind, not to commit the country and the railroads to so vast an expenditure, until one system, or the lines in one section of the country, shall first be valued and the results demonstrated to the country.

Sixth.—That, as another necessary result of a constructive and equitable policy towards railroads, and with a Commission amply strengthened to deal with railroad questions, Congress would no doubt refer to the Commission for investigation and report, such legislation as affected wages, employes' working hours and conditions, increased taxes, boiler inspections, extra and unnecessary men on trains, non-compensatory mail and parcel post service, railroad valuation, improved stations, grade crossing elimination, and other matters which seriously affect railway revenues and expenses. Due weight to these heavy expenditures would thus be given in approving rate schedules, and a tangible basis would be thereby provided on which to continue the regulation of these matters (if essential to the public welfare), without injustice to the railroads. The inability of the railroads to protect themselves in respect to increased wages fixed by governmental action could not be more forcibly presented than in the November, 1913, report of the Board of Arbitrators under the Newlands Act, relating to conductors' and trainmen's wages, on which your President served as chairman.

Seventh.—That the extraordinary power to suspend rates without a hearing should be limited to a period not exceeding sixty days after rates are filed with the Commission, or some such reasonable period. If, after such hearing as could readily be had within this period, coupled with the information and data already possessed by the Commission, from the current and special reports made by the railroads, under its uniform accounting regulations, the Commission could not be satisfied that the increase proposed ought not to be made, the rate should rightfully become effective, and the present confusion and delay would end. The railroads, as an act of self-preservation, will always endeavor to make their service and facilities satisfactory, and their rates reasonable, because only in this way can they make friends, encourage business and earn profits.

In conclusion, I would say that considerable emphasis has been laid upon the fact that the railroad companies, and their owners, are deprived of an appeal to the courts for the protection of what they conceive to be their just rights, as against the orders of the Commission. I am willing, however, to continue relying upon public regulation and public opinion to protect the railroads, although I cannot overlook the fact that the Eastern railroads are earning a return of less than 4 per cent on their property investment. If this is not approaching confiscation, how much less must we earn before reaching that point? Surely the country does not want impoverished railroads, unduly restricted in the conduct of their business. What it does want is strong, aggressive lines, built and improved with private capital, efficiently managed and operated, subject to equitable public regulation.

What I have suggested may not meet all the difficulties in the public regulation of railroads. Other helpful suggestions will doubtless be forthcoming from railroad and business men and commercial bodies, etc.,—and, I trust, from some statesmen. There can be no difference of opinion that public regulation must be equitable so far as the railroads are concerned, and must be adjusted to promptly respond to business conditions. Such a change will encourage initiative and enterprise in railroad management and will assure investors, here and abroad, that their money has the full protection of our laws and that they will be equitably dealt with.

I believe in regulation by commissions, and I urge, therefore, that we do not encourage destruction of such regulation, but rather its conservation, by adapting it, as we have banking regulation and other laws, to suit the needs of the country as they change from time to time. We must look beyond the present obstacles and view the whole subject from the statesman's standpoint. Under an enlightened policy of public regulation, but not repression, the railroads will be placed and kept in a strong position to meet increased traffic demands, as well as to live healthfully in times of depression. If we now by equitable dealing ensure their strength, one of the greatest obstacles to the recovery of financial confidence and business enterprise can be removed.

THE COTTON TRADE AND THE EUROPEAN WAR CRISIS OF 1914

By Arthur Richmond Marsh*
Editor, "The Market World and Chronicle"

THE re-opening for regular business of the New York and New Orleans Cotton Exchanges, on November 16th, was generally accounted in all parts of the United States, even those not directly concerned with the production or manufacture of cotton, as an event of the most considerable importance for the economic and financial welfare of the country. For weeks, before the members of the exchanges were able to repair and restore the machinery of trading in contracts for the future delivery of cotton, which had been gravely disordered by the sudden paralysis of commerce and credit occasioned by the war in Europe, there had been anxious and urgent appeals from all directions for the speedy resumption of business. Not only cotton merchants, cotton manufacturers and very numerous cotton producers, but also leading bankers, large manufacturers and merchants in other fields than cotton, and the very officers of the Government of the United States, had repeatedly given expression to their desire that the great authoritative markets for trading in cotton should begin again to fulfil their function, both of establishing a calculable valve for cotton and of affording the means whereby the oppressive surplus of cotton in the United States might begin to be distributed as widely as possible, whether geographically or over future months and years. Impatience was shown in more than one quarter at the slowness with which the the cotton exchanges appeared to be resolving the difficulties with which they had to contend. Few except the members themselves comprehended the world-embracing character of the business done in these institutions, the vast complexity of the international commitments outstanding when the war broke out, the losses and the possibilities of loss necessarily resulting from the interruption of financial and commercial communications, the unavoidable defaults or partial defaults of manufacturers and merchants and traders in all directions whose resources were insufficient to meet the sudden and violent strain,—in short, all the unparalleled confusion and harm in one of the greatest departments of the world's commerce, caused by the unparalleled catastrophe to modern society. To restore order and safe conditions in such a situation was a work of time, no less than of resolute courage and the highest technical skill, both in the things of commerce and in those of finance; but while the country waited the work was gradually accomplished and at last the cotton exchanges were able to

*An address before the New York Chamber of Commerce, December 3, 1914.

take up their usual business again. Then followed the chorus of expressed satisfaction to which reference has been made. For the members of the New York Cotton Exchange, there was an element of strangeness and even perhaps grim humor, both in the urgency of the general appeal for the restoration of the instrumentalities of these institutions and in the gratification with which this restoration was received. For it happens that in recent years these cotton exchanges have had to undergo an amount of private and public criticism and even obloquy, such as rarely falls to the lot of those associated in any great industry or trade. At the very moment when the war burst upon the world, and cotton at a stroke became the greatest single problem of the United States, there was pending in Congress a bill severely restrictive and, by implication, condemnatory of the customary activities of the American cotton exchanges,—the so-called Lever Bill,—which on August 18, at the height of the disturbance and distress, became law, under the title of the "United States Cotton Futures Act." Behind this legislation lay a series of years of bitter denunciation of the alleged abusive and immoral practices of the cotton exchanges; of virulent attacks within and without Congress upon the very nature of the business transacted by the members of the exchanges; and of clamor either for the total abolition of these institutions by the Government or for such minute and comprehensive regulation of them as would deprive their members of most of the natural rights of citizens of the United States in the pursuit of their private affairs. The hue and cry had become general; the Congressional Record was filled with the noise of it; the press, especially in the South, with few exceptions had joined in it; and even among the business men of New York in the close vicinity of the New York Cotton Exchange, there were found many who lent their voices to it.

The sudden change from this preponderant note of criticism and denunciation to the congratulatory tone of the expressions with which the re-opening of the cotton exchanges has been received, has probably made a greater impression upon the members of the exchanges than upon the public at large. To be called "gamblers" one day and public benefactors the next is an experience vivid and unforgetable for those who undergo it. The members of the cotton exchanges, however, do not delude themselves with the belief that it is some sudden change in them and in their practices which has brought about this *volte-face* on the part of their critics and of the public which so short a time ago was accepting at their face value the utterances of these critics. The cotton trade of the United States to-day, whether individually or associated in the cotton exchanges, is exactly what it has been for long years, unless it be that it is now purged of some of its misconceptions about men and things by the fires of adversity through which it has just passed. Taken as a whole the American cotton trade holds the same commercial position, in all essentials, that it had before the war,—no better and no worse. It still has the same commercial probity and the same high credit that have enabled it to carry the burden of the distribution of the annual cotton crop of the United States. Members of the New York Cotton Exchange have long handled at least 80 per cent of this annual crop, having in normal years a money value of some $800,000,000; they have provided the complicated machinery for buying it from the farmers, bringing it together, separating it into its many grades and qualities, and distributing it to the uttermost parts of the globe. Their credit and financial relaions have been infinitely more extensive and complex than those of the Stock Exchange; and the reliability and security of their dealings have been successfully put to a far severer test,—high though the standard of the Stock Exchange unquestionally is. In all these respects the American cotton trade stands to-day just where it has always stood; it "gambles" neither more nor less; it conceives its duties to be no whit different; it has the same rules of fair dealing with the cotton producers, on the one hand, and with the spinners, near and remote, on the other; it is prepared to serve the economic welfare of the country in no different sense than before.

The change that has come about, within the past four months, in the public attitude towards the American cotton trade, and towards the cotton exchanges in which its members are associated, is accordingly not due to a reformation of the cotton trade itself, but to a sudden appreciation, on the part of a multitude of persons throughout the country, of the indispensableness of the cotton trade and the cotton exchanges to the welfare of the United States. And this appreciation itself has been due to the discovery (for such it has been to most), compelled by the European War, that the country has become extraordinarily dependent upon the sale of two-thirds of its annual cotton production, both for the settlement of its international debts, and for the domestic prosperity and even solvency of a most important part of its population. Until the war interrupted the activities of those who have hitherto quietly attended to the foreign sale of our cotton, there had prevailed a certain lack of correspondence between common thinking about cotton and the actual facts in regard to it. Cotton had come to be surrounded with a kind of glamor; it had had associated with it a mass of economic misconceptions; the producers of it and their spokesmen had come to apply to it the fallacious phrase that "cotton is always gold"; the assumption about it was rife that its indispensableness gives it a kind of primacy among commodities, and that this primacy confers upon the producers of it an authority with regard to the price it should bring and the manner of dealing in it, which is asserted by the producers of no other commodity in the world, unless it be the miners of African diamonds. It had become impossible for the communities in this country primarily dependent upon cotton to conceive that a condition of things might come about in which there would be no buyers of their product; and the country as a whole, even as represented by its bankers, had lost the power to visualize a situation in which the foreign demand for our cotton would not be enough to enable us, as a matter of course, to liquidate thereby the greater portion of the adverse annual balance of our international commerce. As a consequence, the sudden stoppage of the machinery of distribution of cotton, brought about by the war, proved a rude shock to the confidence with which cotton had been traditionally regarded.

It has been intensely interesting to follow the course of events in connection with cotton since early August, as illustrative of a growing perception that there is nothing automatic about the method by which the United States derives from its annual cotton crop the great economic benefits which the ability to produce abundantly this most important of all fibrous materials for human use confers upon the country. When the war began, over-night as it were, virtually nobody could realize the paralysis of world commerce and credit which was speedily to ensue. The cotton crop of the United States for 1914 was even then beginning to be picked and marketed; and, on the other hand, there had accumulated a balance of short-term indebtedness abroad of not far from $500,000,000, whose rapid reduction through shipments of the new cotton everybody was counting upon. The crop itself, after having appeared in its earlier stages to promise only a moderate yield, was already beginning to show that rapid gain in condition which has resulted in fact in the largest production of cotton ever achieved in the United States. The world's consumption of American cotton has been advancing

(Continued on Page 731.)

INSURANCE

AN unsettled condition of things continues with respect to the incidence of the new war revenue tax imposed upon the policies of insurance issued by fire, casualty, liability, surety and other kinds of insurance companies enumerated in the emergency revenue act that went into force on December 1. One question is whether the insurance company issuing a policy should itself pay the tax, either as a matter of law or of essential equity. Another question is whether it is or is not the better policy for the company to pay the tax. Most of the casualty, liability and surety companies appear to have come to the conclusion that, inasmuch as a ruling of the Commissioner of Internal Revenue will enable them to obtain a refund of the amount of revenue stamps affixed to policies and renewals of policies returned as "untaken," they had best assume the burden themselves and raise no question about it with their policyholders. With the fire insurance companies, however, the case is different. To begin with, the sum total of the tax is immensely greater for them than for the other companies, both because of the volume and because of the character of their business. Then, the underwriting margin in fire insurance is at the best far narrower in fire insurance than in any other form of insurance, and in fact tends to be a minus, rather than a plus quantity. Finally, the National Board of Fire Underwriters, after a careful consideration of the entire financial situation of fire insurance in the United States, has concluded that it is little short of financial folly for the fire companies to cut even by a little into the scanty net returns they are realizing in reasonably good years or to add to the net losses they are continually exposed to in years when they must pay for one or more conflagrations. Consequently, the fire insurance companies have undertaken to pass the cost of the new stamp tax on to the buyers of fire insurance.

This determination, as was pointed out in this paper last week, has stirred up a considerable amount of opposition and led to not a few bitter criticisms of the companies. Almost as a body the agents have protested, both on the natural ground that it is vexatious to their customers to have to pay anything more than the premiums on their policies and also because they have perhaps had some apprehension lest they should themselves in the last resort be compelled to provide the revenue stamps out of their own pockets. But buyers of fire insurance, both individuals in a large way of business and associations of manufacturers and merchants, have endeavored to resist the determination of the fire insurance companies that the insured must meet the cost of the tax. Thus the Merchants' Association of New York City has sought unsuccessfully from the New York State Insurance Department a ruling to the effect that the insurance companies must provide the revenue stamps. Failing here, the Association has applied to the Commissioner of Internal Revenue for a construction of the terms of the taxing act to the effect that the intent of the legislation is that the insurance companies alone are to be taxed. Upon this point, however, the Commissioner of Internal Revenue has declined to commit the Government, but has sent the following indeterminate reply to the Merchants' Association: "You inquire whether the tax should be borne by the insurance company or the policyholder. In reply, you are informed that, if the company insists that the insured party pay the value of the stamp, it is not a matter which the internal revenue laws can deal with. It is a matter between the insurance company and the policyholder." This ruling is, of course, subject to review by the courts; but it is improbable that the interest of any single buyer of fire insurance would be large enough to warrant him in taking the question there.

In contrast with the New York Insurance Department, (and, it may be added, of the New Hampshire and one or two other departments), a number of State insurance commissioners have entered the lists in behalf of the policyholders, as against the insurance companies. These commissioners have sought to find in the anti-rebate laws or other statutory requirements of their respective States means to compel the insurance companies to assume the tax. A good illustration of rulings of this tenor,—one which aims to do all possible for the policyholder without taking an extreme position as regards the companies,—is that of the Michigan Insurance Department, which runs as follows:

"The situation in Michigan is such that a company cannot pass this tax as a separate item on to the assured or to the agent. If the company seeks to have the assured pay the tax it will be in violation of Act No. 285 of the Public Acts of 1913, which prohibits the collection from the assured of any fee or charge in addition to the premium charge made by the company for assuming the risk. If the company seeks to have the tax paid by the agent it will be in violation of Act No. 127 of the Public Acts of 1911, prohibiting rebates on premiums of fire insurance policies. The only method by which the company can pass the tax on to the assured would be by including it in the premium itself, as written in the policy, and it would have to be included as a part of the premium, and not as a separate item. The company could do this, because we have no law regulating rates. The company could not, however, make a premium rate and a revenue tax charge also, nor can the matter be billed as two items to the assured. The entire charge must appear as the premium. The above ruling is subject to an investigation as to whether in the past a Federal court has ever ruled that an insurance company may pass a similar Federal tax on to an assured. If such is the case, I do not believe our anti-policy fee law would operate against the decision of the Federal court."

No doubt, the practical effect of this ruling is intended to be that the fire insurance companies will assume the tax rather than incur the expense either of resorting to the courts or of reframing their schedules of rates. It may, however, be said of the ruling that it is not violent or peremptory in its terms, and above all that it contains no assertion that the equities of the matter are all in favor of the policyholders. Very different in form and in tone are the ruling and accompanying memorandum of Mr. Ekern, Commissioner of Insurance of Wisconsin. These are printed on another page of this paper in exemplification of what State supervising officials should not do or say. Mr. Ekern constitutes himself a Federal court for the interpretation of the terms of the taxing statute; he summons to his aid provisions of the statutes of Wisconsin, obviously not intended for this purpose; and, finally, he attempts a financial analysis of the profits of fire insurance, both in Wisconsin and in the country as a whole, from which he deduces in effect that the fire insurance companies are guilty of insatiate greed, in that they are unwilling to surrender a part of their inordinate gains for the benefit of the hard-pressed buyers of fire insurance. All that need be said of his figures is that, to begin with, they are wholly misleading and open to the charge of being disingenuous; and that, further, even if they correctly represent the situation, they abundantly prove the accuracy of the assertion of the managers of fire insurance that, in comparison with the results obtained in other commercial and financial enterprises, fire insurance capital in the United States is inadequately compensated as things have been, and will be still less adequately compensated if Mr. Ekern succeeds in preventing the companies from transferring the new tax from themselves to the insured.

FIVE YEARS' EXPERIENCE UNDER FEDERAL WORKMEN'S COMPENSATION ACT OF 1908

THE Bureau of Labor Statistics of the United States Department of Labor has just issued a report upon the Federal workmen's compensation act of May 30, 1908, which gives in great detail the experience of the National government under this act during the first five years of its being in force. The report is of decided interest and great value to students of social insurance both because it is the first available tabulation of compensation insurance in this country over a period of years of sufficient length to make the statistics in the least trustworthy, and because it is convincing proof of the contention long maintained by a few of the more analytical students of compensation that experience in the United States would not prove contrary to that of the several European countries as to the rapid increase in the number of accidents compensated and in the annual cost of the law. This last fact is shown in that while the number of employes covered, which was approximately 82,650 under the law as enacted, was increased to a trifle over 100,000, or by about 20 per cent., by various amendments during the five years 1908-1913, the number of reported accidents increased from 4,887 in 1908-9 to 10,876 in 1912-13, an increase of 122.7 per cent, and the amount of compensation paid from $242,937.05 in 1908-9 to $392,124.80 in 1912-13, an increase of 61.0 per cent. It would be well for those States which are planning to adopt new compensation laws or to amend old ones during the coming year to take some of these facts into their calculations lest they find that they have reckoned without their host.

There are given below such excerpts from the Department of Labor report as it is possible to print in the limited space available.

* * *

Introduction and Summary.

By the act of May 30, 1908 (35 U. S. Stat. L., p. 556), entitled "An act granting to certain employees of the United States the right to receive from it compensation for injuries sustained in the course of their employment," the United States Government established a system of compensation for industrial accidents for the majority of its industrial employees, this being the first general accident compensation law in this country.

This act came into effect August 1, 1908, and this report presents data for the first five completed years of its operations. As enacted this law covered artisans and laborers in manufacturing establishments, arsenals, and navy yards, river and harbor and fortification work, hazardous employment in the reclamation of arid lands and work on the Isthmian Canal Commission. It was later extended to include all employees under the Isthmian Canal Commission and to take in employees in the Bureau of Mines, the Lighthouse Service, and the Forestry Service engaged in hazardous employment, and is estimated to embrace at the present time approximately 95,000 persons, or somewhat less than one-fourth of the civilian employees of the United States.

The law is a pioneer one in this country as a general compensation measure, though a form of compensation had been allowed for injured railway mail clerks and employees in the Life Saving Service for some years. While effective in force from the compensation laws enacted in the States, it must be regarded as having had a measure of influence in the direction of the enactment of such legislation, and since the enactment of this law 21 States have made provision for compensation in some form or other.

The administration of this act is committed to the Secretary of Labor, the consequent duties in connection therewith being performed in a large measure by the Bureau of Labor Statistics. An amendment of the act bearing date of March 4, 1911, transferred the duty of administration, so far as it affects employees of the Isthmian Canal Commission, to the chairman of that commission; as a matter of statistical completeness, however, the operations under the act on the Isthmus are annually reported to the Department of Labor and are combined with the reports of operations in other establishments.

The number of accidents reported in all departments during the first year (11 months) was 4,887, for the second year 6,989, rising to 9,381 in the third year, to 10,157 (computed) in the fourth, and to 10,876 in the fifth, making a total of 42,290 for the 5 years. Of the total number of accidents, 1,006 were reported as fatal, the numbers for the 5 years being 233, 231, 207, 218, and 117, respectively. Approximately 10 per cent of these fatalities were in occupations not subject to compensation under this or any other law. The number of claims increased from 1,818 for the first year* to 3,526 for the fifth, the total for the period covered by the report being 14,963. Of this total, 14,046 were allowed, 911 were disallowed, and 6 were not acted upon. The total paid out as compensation amounted to $1,803,923.27. The payments for the first year (11 months) were approximately $243,000, for the second year $337,000, for the third year $411,000, for the fourth $435,000, and for the fifth $378,000.

The basis of the accident reporting is much broader than that for compensation, the Secretary of Labor having made a request of all Government offices that they should report cases of accident arising in the course of employment causing disability for one day or longer. Nearly one-half of the accidents and of the compensation paid refer to employment under the Isthmian Canal Commission, with its 25,000 to 30,000 employees, largely unskilled, and working under conditions involving a high degree of hazard.

The law is restricted not only to certain classes of employment, but also to accidents causing disability in excess of 15 days. Injuries resulting from the negligence or misconduct of the injured person are not compensated, and claims on account of death must be filed within 90 days. It is obvious that employees in establishments not covered by the provisions of the act will refrain from making claims for compensation when that fact is known, so that the number of claims submitted will be affected to some extent by the injured person's estimate as to the probability of his securing relief in this way. Thus, of the number of claims rejected on account of the occupation not being covered by the act, there were 45 in the first year,* 34 in the second, 29 in the third, 21 in the fourth, and 23 in the fifth, while failure to furnish sufficient evidence to support the claim was the ground for rejecting 15 claims the first year,* 48 claims the second, 89 in the third, 100 in the fourth, and 25 in the fifth. Negligence or misconduct of the injured workman prevented recovery in 109 cases during the 5 years.

The basis of compensation payments is the injured workman's wages, the amount awarded being the same as the rate of such wages during disability, not exceeding one year, or, in fatal cases, an amount equal to one year's wages of the deceased workman. The amount paid for fatal cases approximated 18 per cent of the total amount during the first three years, falling to about 15 per cent the fourth year and 10 per cent the fifth. The average payment per fatal case was $704 for the first year, $633 for the second, $595 for the third, $681 for the fourth, and $661 for the fifth. For non-fatal compensated accidents the average amount paid the first year was $121, for the second year $113, for the third year $120, for the fourth $109, and for the fifth $107. The Isthmian Canal Commission is chargeable with by far the largest

* Eleven months.

amount of costs for compensation, the Navy Department ranking next, the War Department standing third, and the Interior Department fourth.

The distribution of costs on the basis of the period of disability for the third year shows approximately 38.7 per cent of all costs expended for injuries causing disability for not over three months, while cases lasting three months but not over six months absorbed 8.7 per cent of the amount paid for compensation for the year. Cases causing disability for more than six months required 35.0 per cent of the total amount, while fatal cases required but 17.7 per cent of the total cost.

By reason of the fact that compensation for non-fatal accidents terminates on the recovery of the injured person to an extent sufficient to allow him to resume work, but little can be determined from the data of this report as to the results of accidents causing permanent partial disability, nor is there any accurate information as to the effects of accidents causing a disability for over one year, since at the end of the compensation period, which can not exceed one year, the accounts of the injured persons are closed and no further record kept of them, so far as this act is concerned.

While a very considerable number of serious injuries were debarred from compensation under this act because of the restrictions of its applications, the failure to recognize permanent partial disability on a different basis from disability from which complete recovery may be anticipated, results in very inadequate compensation of such cases. Thus, fractures of an arm or leg led to payments in amounts less than $25, the loss of an eye in amounts varying between $25 and $50, and in a case of the loss of a right arm the injured workman was entitled to a payment of less than $50, while in three cases of the loss of both legs, occurring during the third year, the average compensation was $377.40. These small amounts were due to the fact that compensation payments (limited to usual wages) must cease when the injured employee is able to resume work, and in any case not continue beyond 12 months.

In view of the wide range of employments covered by the act it is but natural to expect to find a large variety of causes of accident. The use of railroad transportation in work on the Isthmus co-operates with the hazards of railway employees to make railway operations the leading cause of accident. One of the most frequent causes of injury is the collapse and fall of materials, while falls of the person injured are likewise a very frequent cause. The use of hand tools and simple instruments ranks above the use of working machinery using power as a cause of injury, but this is doubtless due to the fact that the number of workers with such tools is much larger than the number of machine workers.

Considering the report as a whole, it is of special interest as showing the results of the operations of a law which was enacted to relieve the situation of a class of employees who are without legal redress, and which, despite its incompleteness, has been one of great benefit to a very considerable number of injured employees and their dependents.

This report is of special interest at this time in view of the movement for the amendment of the law and its extension to cover all employees of the United States and to provide compensation for all accidents (including occupational diseases) resulting in death or disability continuing for more than three days. The fact that the bill providing for these changes has received a favorable report from the House Committee on the Judiciary after extended hearings makes the record of the experience under the existing law of more than usual value in the consideration of the details of this proposed legislation.

Summary of Accidents Reported and Injuries Compensated.

The principal data for this period may be summarized as follows:

NUMBER OF ACCIDENTS REPORTED, CLAIMS FOR COMPENSATION, AND AMOUNT OF COMPENSATION PAID FOR THE FISCAL YEARS, 1908-09, 1909-10, 1910-11, 1911-12, 1912-13.

	1908-09.*	1909-10.	1910-11.	1911-12.†	1912-13.
Number of accidents reported (all departments)	4,887	6,989	9,381	7,997	10,876
Number of claims received	1,818	2,656	3,171	3,793	3,525
Number of claims allowed	1,692	2,530	2,948	3,489	3,387
Number of claims disallowed	126	126	220	301	138
Amount of compensation paid	$242,937.05	$337,257.77	$410,698.53	$435,137.66	$392,124.80

*Eleven months.

†Not including Isthmian Canal Commission meritorious sick-leave cases reported from November 1, 1911, to June 30, 1912.

The number of injuries reported for the fiscal year 1911-12 does not include meritorious sick-leave cases handled on the Canal Zone from November 1, 1911, to June 30, 1912, as this information is not available for tabulation.

The total number of meritorious sick-leave cases reported for the fiscal years 1910-11 and 1912-13 was 6,477, an average of 270 per month. The approximate number of meritorious sick-leave cases not reported during the year 1911-12 would be 2,160, using 270 cases per month as the average. These, added to the 7,997 cases reported, would give a total of 10,157 cases for the fiscal year 1911-12.

It is apparent that the monthly average of accidents reported and of claims received was considerably larger for each successive year. This accords with the experience of other countries which have adopted an accident-reporting system, as it is commonly found that a fair degree of accuracy and completeness in reporting accidents is obtained only after some years of experience and familiarity with a new law.

The ratio of claims to accidents reported varies for the years 1908-9, 1909-10, 1910-11, 1911-12, and 1912-13, being 37.2 per cent, 38 per cent, 33.8 per cent, 37.3 per cent, and 32.4 per cent, respectively. The ratio for 1911-12 is based on 10,157 accidents, being the approximate number of cases for that year. The percentage of claims rejected was highest for the year 1911-12, 7.9 per cent being disallowed for that year, and lowest in 1912-13, 3.9 per cent being disallowed. For the year 1909-10, 4.7 per cent of the claims filed were rejected, and 6.9 per cent were disallowed for each of the years 1908-9 and 1910-11.

The number of fatal accidents reported, the number of resulting claims for compensation, and the number of claims approved is shown below:

Years.	Fatal Accidents Reported.	Claims Filed — Number.	Claims Filed — Per Cent.	Claims Approved — Number.	Claims Approved — Per Cent.
1908-09*	233	93	39.9	64	68.8
1909-10	231	124	53.7	97	78.2
1910-11	207	148	71.5	122	82.4
1911-12	218	131	60.1	98	74.8
1912-13	117	69	59.0	56	81.2

*Eleven months.

The large proportion of fatal accidents in which no claims were made is explained in many cases by the remoteness or non-existence of dependent relatives, or, when the law first went into effect, of their ignorance of it, or by the evident fact that the establishment in which the decedent was employed is not covered by the law.

Amount of Compensation Paid.

The total amount of compensation paid under the act for accidents which occurred during the 11 months ending June 30, 1909,

was $242,937.05, of which 18.6 per cent was paid for fatal accidents and 81.4 per cent for non-fatal accidents. The average amount of compensation for a fatal compensated accident was $704.48 and for a non-fatal compensated accident, $121.53.

Similar compensation paid during the fiscal year 1909-10 amounted to $337,257.77 for all classes of accidents, of which 18.2 per cent was paid as compensation on account of fatal accidents and 81.8 per cent on account of non-fatal accidents. The average amount of compensation paid per fatal compensated accident was $633.15 and per non-fatal compensated accident, $113.52.

In the fiscal year 1910-11 the total was $410,698.53, of which 17.7 per cent was for fatal and 82.3 per cent for non-fatal accidents. The average amounts paid this year per fatal and non-fatal compensated accident were $595.05 and $119.64, respectively.

For the fiscal year 1911-12 the total amount paid was $435,-137.66, of which 15.3 per cent was for fatal and 84.7 per cent for non-fatal accidents, the average amount paid for the former class being $681.31 and for the latter class $108.89.

For the last year covered by this report, 1912-13, $392,124.80 was paid, 9.44 per cent of this amount being for fatal and 90.6 per cent for non-fatal accidents. For this year the average amount paid for fatal cases was $661.12 and for non-fatal cases, $106.96.

Rates of Pay of Injured Employees.

The figures for the 11 months in 1908-9 indicated that nearly two-thirds (65.5 per cent) of all injured employes were earning less than $1,000, more than one-half (55.5 per cent) less than $800 and nearly two-fifths (39.1 per cent) less than $600; in 1909-10, 68.5 per cent of all injured employees were earning less than $1,000; 59.3 per cent less than $800; and 42.3 per cent less than $600. The percentages for the corresponding wage groups in 1910-11, 1911-12, and 1912-13 are 70.8, 63.6, and 49.3; 70.3, 61.3, and 41.8; 72.8, 64.9, and 47.2, respectively.

Causes of Accidents.

In the tabulation of the causes of accidents, the standard classification of causes as used by many European countries has been adopted with some modifications.

The following summary table shows the distribution of injuries by causes for all departments and services combined. During the first year the collapse, fall, etc., of materials stands out as the largest single cause of injury, during the second year it ranks third, and for the remaining years it was the second principal cause. With the exception of the first year, loading, unloading, lifting, etc., caused the greater number of injuries, with railway operations, flying bodies, and hand tools as the other principal causes.

NUMBER AND PER CENT OF ACCIDENTS REPORTED FROM EACH SPECIFIED CAUSE FOR THE FISCAL YEARS 1908-09, 1909-10, 1910-11, 1911-12 AND 1912-13.

†Not including Isthmian Canal Commission meritorious sick-leave cases for seven months.

Duration of Disability.

Some caution is necessary in considering these data. First, there is apparent a very low proportion of injuries reported as permanent. As a matter of fact, the information concerning permanent disability is necessarily incomplete, since the law does not concern itself with the results of the injuries after the expiration of the first year, and the department has no means of determining accurately how many of the injuries lead to permanent disability. Whether or not ultimate recovery will take place can only be estimated, and it is very likely that many of the cases reported as of a duration of 365 days, or a longer period, may actually be cases of permanent disability. No method exists, however, of following up cases of injury after the termination of the first year of disability.

A further important qualification is found in the failure of the law to recognize partial permanent disability. In case of return to work the disability is considered as having terminated, though the results of the injury are often permanent and such as seriously to impair the earning capacity of the employee in any other employment which he might be forced at some time to seek. In some cases the permanent nature of the injuries and the permanent reduction of earning capacity are quite evident, as may

be ascertained by an examination of the tables in which the accidents are classified according to the nature of the injury and duration of disability.

In the following table a comparison is made of the duration of compensated accidents with that of non-compensated accidents for the purpose of determining whether the fact of compensation appears to influence in any way the duration of disability. Accidents causing disability of 15 days or less and fatal accidents are eliminated.

PER CENT OF COMPENSATED AND NON-COMPENSATED CASES, BY CLASSIFIED DAYS OF DURATION, FOR THE FISCAL YEARS 1908-09, 1909-10, 1910-11, 1911-12, 1912-13.

SAVINGS BANK LIFE INSURANCE IN MASSACHUSETTS

MR. WILLIAM T. MONTGOMERY, State Actuary in Massachusetts, has just issued a report on the financial condition of the Massachusetts Savings and Insurance Banks as of October 31, 1914. This report, when compared with the report for the year ending October 31, 1912, shows that although the selling of insurance over the counter may not yet be called an assured success, still a certain amount of progress has been made. Premium income of the four Massachusetts banks doing this form of business shows an increase of $38,120.88, or 37.5 per cent, in the past two years, while policies in force have increased by 2,774, or 41.6 per cent, during the same period. These figures are, of course, almost infinitessimal when compared to those for some of the huge life insurance companies doing business in all the States of the Union, but considering the very limited field of operation open to non-soliciting institutions such as savings banks, the showing by the four Massachusetts institutions is not at all discreditable. That savings banks should ever become serious factors in the life insurance business and competitors with the regularly organized life insurance companies, is more than unlikely. Any efforts, however, which promise to furnish at decreased cost a commodity, endowed as life insurance indeed is, "with a public interest," cannot be dismissed summarily from the attention of those who are concerned with all forms of constructive activity for the benefit of society.

There is given below Mr. Montgomery's report, as published:

* * *

The financial condition of the savings and insurance banks at the close of the fiscal year, October 31, 1914, is highly satisfactory, and so much so that, under the law, the two oldest banks must declare extra dividends to their policyholders.

Whitman Savings Bank.—In addition to the regular dividends this bank has declared extra dividends varying from 25 per cent for first-year policies to 300 per cent for sixth-year policies on the annual premium form (these percentages being per cents of the regular dividends), or, in other words, an extra dividend equal to one-quarter to three times the regular dividend in addition to the regular dividend.

An example shows that in the fifth year, the regular dividend, together with the extra dividend, makes a total return to the policyholder of from 35 per cent to 44 per cent of the yearly premium for age 35 at issue.

On monthly premium policies the extra dividend varies from 25 per cent for first-year policies to 250 per cent for seventh-year policies (these percentages being per cents of the regular dividend in each case), or, in other words, an extra dividend equal to one-quarter to two and one-half times the regular dividend in addition to the regular dividend. On the sixth-year policies the regular dividend is 22½ per cent of the year's premium, which, together with 200 per cent extra dividend, makes the total dividend for this year 67½ per cent of this year's premiums.

People's Savings Bank.—The extra dividend in this bank varies from 12½ per cent for the first-year policies to 150 per cent for sixth-year policies of the regular dividend in addition to the regular dividend for annual premium policies, or, in other words, an extra dividend equal to one-eighth to one and one-half times the regular dividend in addition to the regular dividend. For monthly premium policies, the extra dividend varies from 12½ per cent for first-year policies to 100 per cent for sixth-year policies (the percentages in all cases being per cents of the regular dividend), or, in other words, an extra dividend equal to one-eighth to one regular dividend in addition to the regular dividend.

The percentages of the total dividends to the policyholders are thus considerably increased and make very substantial returns to the policyholders, which still further decrease the cost of insurance to the citizens of Massachusetts.

An abstract of the combined financial reports of the insurance departments of the Whitman Savings Bank, the People's Savings Bank of Brockton, the Berkshire County Savings Bank, and the City Savings Bank of Pittsfield for the fiscal year ended October 31, 1914, follows. The Berkshire County and City Savings Banks of Pittsfield have not been established so long as the Whitman Savings Bank and the People's Savings Bank of Brockton. The two Pittsfield banks have declared their regular dividends under the operation of which the net cost to the policyholders in these banks as well as in the others is very low; all four banks' regular dividends are the same.

The total premium income was $139,753.05. The total interest income was $20,563.46. The total income was $160,320.81. The total disbursements of the year for all four banks were $64,464.34, of which $35,335.32 was to policyholders, which includes death

claims amounting to $9,636.10, dividends to policyholders amounting to $12,422.85, and surrender values paid in cash, $12,826.

The total expenses chargeable against the premiums received during the year amounted to $24,129.02, or 17.26 per cent. The contributions to the general insurance guaranty fund amounted to $5,563.11, which, although a charge against the premium, is not strictly speaking an expense. The total expenses less guaranty fund contributions leaves a balance amounting to $18,565.91. In this amount $4,857.95 interest paid to holders of the certificates of the special guaranty funds is included, although not a charge against the premium. Deducting this item leaves a balance of $13,677.96, of which $2,536.00 was on account of medical fees which occur only once during the history of a policy. The total expenses of $24,129.02 less medical fees leaves $21,741.97, which includes the contribution to the general insurance guaranty fund, irrespective of the duration of the policy, and $4,887.95 interest paid to holders of the certificates of the special guaranty funds. Subtracting the interest paid on account of the special guaranty funds leaves $16,854.02 as a measure of the expense after the first year of the policy. This ratio of expense gives about 12.06 per cent as a measure of the charge against the premiums after the first year. The first years of business of the Berkshire County Savings Bank and the City Savings Bank serve to offset the showing made by the two older banks.

The admitted assets of all four banks amount to $520,968.40, of which $95,000 is on account of guaranty funds in each of the four banks. The general insurance guaranty fund, made up of 4 per cent of the premiums collected by all banks, amounted on October 31, 1914, to $21,625.33 and is also a general asset.

The total liabilities, not including $95,000 in guaranty funds, amounted to $425,968.40, which includes $349,758 reserves set aside on all policies outstanding in all banks on October 31, 1914, dividends apportioned, surplus, etc. The dividends apportioned during the coming year amount to $27,459.61 and a surplus in excess of all liabilities amounting to $44,112.53 is shown.

There were issued by all four banks during the year ended October 31, 1914, 2,403 policies representing $781,962 of insurance. There were also 11 old policies revived and increased amounting to $11,000 of insurance. There were [illegible] 1,285 policies for $415,972 of insurance. There were in force in all four banks on October 31, 1914, 9,439 policies for $3,556,015 of insurance, with annuity additions of $17,278. There were also in force 96 deferred annuities representing annual payments of $12,209.

A POETICAL PARALLEL TO CERTAIN COMPUTATIONS OF WORKMEN'S COMPENSATION INSURANCE

Actuaries are called upon to [illegible] to terms of mathematical formulæ the effects of the deepest human emotions, and they can not be neglected in this field. The [illegible] of cost under [illegible] the [illegible] to calculate [illegible] the [illegible] of a widow and her nine children, and of the survival of each of the nine children until the age of eighteen has been reached. Cold-blooded as it may appear to calculate mathematically this problem of life and emotion, it is the actuary's task to undertake it.

At the inaugural meeting of the Casualty Actuarial and Statistical Society of America, reported in these pages three weeks ago, matters of the kind just described were broached in papers and in discussions of them. Formidable actuarial formulae were propounded, quite sufficient to have made the widow and her nine children aghast, if they could have seen what they were reduced to. Even some of the hardened casualty insurance men present were unwontedly moved by what they heard and saw (on the blackboard). One of these, Mr. Frank E. Law, vice-president of the Fidelity and Casualty Company, was so stirred that, at the ensuing dinner of the new society, his memory yielded a parallel to the discussion he had been listening to, in the shape of a mathematical poem on the subject of marriage, written years ago by a famous Scotch mathematician. The text of the poem, with some account of its author by Mr. Law, is as follows:

* * *

The Mathematician in Love.

I

A mathematician fell madly in love
With a lady, young, handsome, and charming;
By angles and ratios harmonic he strove
Her curves and proportions all faultless to prove,
As he scrawled hieroglyphics alarming.

II

He measured with care, from the ends of a base,
The arcs which her features subtended;
Then he framed transcendental equations to trace
The flowing outlines of her figure and face,
And thought the result very splendid.

III

He studied (since music has charms for the fair)
The theory of fiddles and whistles,—
Then composed, by acoustic equations an air
Which, when 'twas performed, made the lady's long hair
Stand on end, like a porcupine's bristles.

IV

The lady loved dancing;—he therefore applied
To the polka and waltz an equation;
But when to rotate on his axis he tried,
His center of gravity swayed to one side,
And he fell, by the earth's gravitation.

V

No doubts of the fate of his suit made him pause,
For he proved to his own satisfaction,
That the fair one returned his affections;—because
"As everyone knows, by mechanical laws,
"Reaction is equal to action."

VI

"Let x denote beauty—y manner well bred,—
"z fortune,—(this last is essential),—
"Let L stand for love"—our philosopher said,—
"Then L is a function of x, y, and z,
"If the kind which is known as potential."

VII

"Now integrate L with respect to dt
"(t standing for time and persuasion);
"Then, between proper limits, 'tis easy to see,
"The definite integrate Marriage must be:—
"(A very concise demonstration)."

VIII

Said he, "If the wandering course of the moon
"By algebra can be predicted,
"The female affections must yield to it soon"—
—But the lady ran off with a dashing dragoon,
And left him amazed and afflicted.

The writer of the foregoing effusion was William John Macquorn Rankine, a noted mathematician and engineer, who was born at Edinburgh, and lived 1820 to 1872. He long occupied the chair of civil engineering at Glasgow University. In addition to many treatises on subjects relating to his profession, he was one of the founders of the modern science of thermodynamics, and a writer, composer and singer of humorous and patriotic songs. Our quotation serves to illustrate one phase of Rankine's immense energy and many-sided character. Ali hail the "Land o' Cakes and brither Scots!"

Rankine adds a neat touch of humor by pointing out in the second of his equations, that a man of this kind—that is, having the qualities of a mathematician—would need infinite time, from plus infinity to minus infinity, for his successful wooing. We venture to remark that he seems to have studied well the "heart of womankind."

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Proposed Revision of the Philippine Insurance Laws.—Mr. J. F. Boomer, United States correspondent at Manila, sends the following account of the proposed changes in the Philippine insurance laws:

"The special committee of the Philippine Commission appointed to draft insurance legislation to be presented to the legislature at its coming session has made public the draft of a new bill that will, if enacted, materially modify the restrictions on foreign insurance companies doing business in the islands. The measure as drafted provides that hereafter every insurance corporation formed in the archipelago must have a subscribed capital stock of $125,000, of which one-half must be paid up, in cash, before any policy of insurance can be issued, and the remainder must be payable within one year from the filing of the articles of incorporation. If the company is organized as a mutual concern, it must have $125,000 available in cash assets above all liabilities.

"The bill names the insular treasurer as insurance commissioner. Foreign insurance companies will be obliged to obtain a certificate of authority from the insurance commissioner before doing business here, and they must designate by written power of attorney some one within the islands on whom legal notices may be served. No foreign company will be allowed to do business in the Philippines unless possessed of paid-up unimpaired capital stock or assets equal to that required of domestic insurance corporations.

"Before beginning to transact business in the islands every foreign company must deposit with the insurance commissioner, for the benefit and security of policyholders and creditors in the Philippines, securities consisting of bonds of the United States or of the city of Manila or of any other city in the Philippine Islands authorized to issue bonds or of the Government under which the foreign company shall have been organized or other good securities satisfactory to the insurance commissioner to the actual cash value of $50,000. It is specifically provided that if any insurance company organized outside the United States or its possessions shall have deposited in any State of the United States approved bonds and securities for the exclusive security and guaranty of the policyholders of the company in the United States or its possessions to the amount of $200,000, this deposit shall be taken in lieu of the $50,000 deposit just mentioned.

"It is further provided that it shall be sufficient compliance with the provisions of the law if the deposit be made with the Chief of the Bureau of Insular Affairs in Washington or with a safe deposit company to be designated by the Chief of the Bureau of Insular Affairs, which company shall agree to hold the securities subject to the control and order of the Chief of the Bureau of Insular Affairs as the representative of the insurance commissioner of the Philippine Islands. This measure will be discussed thoroughly by the insurance interests of the islands before it is presented to the legislature."

* * *

Investment Yield of Canadian Life Insurance Companies in 1913.—Statistics have recently been compiled by "The Chronicle," of Montreal, showing the average rate of interest or yield on the investments of the life insurance companies of Canada for the year 1913. The figures have been made up, not with the idea of obtaining the average rate of interest and dividends realized upon the companies' security holdings alone, nor upon those with specific investments like mortgages, but to arrive at the average return upon the sum total of the companies' mean assets for the year. The method followed in arriving at these mean assets has been as follows: The mean of the assets is determined by dividing by two the sum of ledger assets as at December 31, 1913, and at the same date a year earlier, and adding thereto the market values of bonds, stocks, etc., over book values, or deducting in cases where the market is less than the book value. The addition or deduction is not made in the case of the British and certain of the United States companies, where the Government Blue Book gives ledger values without information as to market divergence. The interest or yield is considered as made up by receipts from interest and rents during the twelve months ending December 31, 1913, adding thereto the interest and rents due and accrued at the end of the year, less the same items outstanding on December 31, 1912.

The most noteworthy feature of the statistics is the remarkably high average rate of yield on their assets achieved by the Canadian life companies in 1913, as compared both with previous years of their own experience and also with the yield obtained by life companies in other countries. In 1913, the yield for the Canadian companies average no less than 6.17 per cent, as compared with 5.87 per cent in 1912 and with 5.72 per cent in 1911. In 1900, the average yield had been only 4.56 per cent; so that it may be said that the Canadian life companies have succeeded in keeping quite abreast of the world-wide increase of the interest rate which has manifested itself since the beginning of the present century. The following table gives the figures of "The Chronicle" for the average investment yield of the companies for each of the years since 1900:

AVERAGE INVESTMENT YIELD OF CANADIAN LIFE INSURANCE COMPANIES.

Year.	Pct.	Year.	Pct.	Year.	Pct.	Year.	Pct.
1900	4.56	1904	4.80	1908	5.30	1912	5.87
1901	4.66	1905	4.93	1909	5.41	1913	6.17
1902	4.75	1906	4.93	1910	5.45		
1903	4.80	1907	5.24	1911	5.72		

Commenting upon the continuous rise in the average investment yield, "The Chronicle" is inclined to attribute it in no small part to the extent to which a part of the Canadian life companies have invested of late years in high interest bearing Western Canadian mortgages on real estate or farm property. It must be admitted that certain of the companies' balance-sheets show a very high proportion of these investments and that the companies whose average investment yield is the highest are in general those having the largest proportion of mortgages, while those investing

chiefly in securities earn a much lower rate of return. The rule is, however, by no means invariable, and some of the companies whose mortgage investments are of wholly moderate proportions manage to earn very close to the average yield for all companies. Moreover, taking the consolidated settlement of all the assets of all the Canadian life companies, it does not appear that the proportion of investments in mortgages is higher than it ought to be, if the uncomfortable results of exclusive investments in securities, at a time when the world interest rate is rapidly advancing, are to be avoided. Perhaps optimism with regard to the future of real estate and farm values in Canada may have led to over-extension of this kind of investment in a few cases; but there is no reason to think that any very serious losses are likely to be incurred by the companies on this account. The following table, compiled by "The Chronicle," shows the classes and amounts of the several forms of investment held by the Canadian life companies at the close of each of the past three years, but without the adjustment mentioned above in connection with the determination of the mean assets:

CLASSES AND AMOUNTS OF INVESTMENTS OF CANADIAN LIFE LIFE INSURANCE COMPANIES.

	1913.	1912.	1911.
Real estate owned	$9,967,470	$8,941,457	$7,958,157
Mortgages on real estate	87,085,966	75,131,638	63,443,648
Loans on collaterals	1,477,726	2,889,833	2,388,758
Loans on policies, etc	30,800,808	25,810,787	22,896,968
Bonds and debentures	77,144,914	69,388,972	68,099,271
Stocks	11,691,607	16,298,097	14,328,472
Totals (unadjusted)	$218,168,490	$198,460,784	$179,114,376

* * *

The Suicide Record of the United States in 1913.—The "Spectator," New York, publishes in its current issue an article by Mr. Frederick L. Hoffman on the suicide record of the United States in 1913. There are given below extensive excerpts:

"For insured males there is a distinct rise in the suicide rate with advancing age from 1.5 per 10,000 at ages 15 to 29, to 2.8 at ages 30 to 44, and to 4.8 at ages 45 and over. For insured females, however, the rate is practically the same for each period of life. Proportionate to the mortality from all causes, the suicide mortality was highest at ages 30 to 44 for males, or 4.1 per cent, and for females at ages 15 to 29, or 2.1 per cent.* The number of deaths for women, however, is hardly sufficient to warrant entirely safe conclusions. The much higher rate of frequency of suicide among men, as observed in general experience, is, therefore, confirmed by the experience of American life insurance companies for a comparatively recent period of time.

"An interesting comparison is possible with the general suicide rate for the United States registration area, according to sex, for the decade ending with 1912. The table below will show the results by divisional periods of life, but in a slightly different form than the age division adopted for the Medico-Actuarial Investigation.

MORTALITY FROM SUICIDE BY AGE AND SEX, UNITED STATES REGISTRATION AREA, 1903-1912.

Rates Per 10,000 Population.

Ages at Death.	Male.	Female.
Under 15	0.03	0.02
15 to 44	2.39	1.02
45 and over	5.60	1.13

"It is shown that for males at ages 15 to 44 the suicide rate for the registration area was 2.4 per 10,000 of population, which compares with the corresponding rate of 2.2 for the insured male population. At ages 45 and over the male suicide rate for the registration area was 5.6 against a rate of 4.8 for the insured male population. For women it is shown that at ages 15 to 44 the rate for the registration area was 1.02 against a rate of 1.0 for insured females; at ages 45 and over the female rate for the registration area was 1.13 against a rate of 1.0 for insured women. For both sexes, therefore, the suicide rate as disclosed by the American insurance experience was below the average for the general population of the United States registration area, for which the returns may be safely accepted as conclusive.

"It appears that the rate for 1913 for the 100 cities† was 18.7 per 100,000 of population, which compares with a rate of 19.7 for the previous decade. There was, therefore, an actual decline in the suicide rate of 1.0 per 1,000 of population. Out of the 100 cities 49 show an increase in the suicide rate and 51 show a decline. In a general way the relative position of the principal cities, with reference to suicidal frequency, is maintained during the year under consideration. Out of 20 cities, which during the decade ending with 1912 had a suicide rate of from 22.6 to 49.0, eleven show an increase in suicidal frequency against nine showing a decline. The rates for each city have in each case been calculated in conformity to the methods of the census office. It is self-evident, however, that errors in population estimates are unavoidable in the case of cities with unusual conditions, and this conclusion applies particularly to San Diego, Cal., for which the suicide rate is extremely high. It is quite possible that the actual population of San Diego is in excess of the estimate on account of the forthcoming exposition, but it would be hazardous for one not familiar with local conditions to adopt a local population estimate in the absence of an official census. It has therefore seemed best not to make such a correction, but to direct attention to the reasonable probability that the actual suicide rate for San Diego may possibly be below the rate given in the table. * * *

"The suicide statistics of American cities for the last twenty years are summarized in the usual form in the table below, and more conveniently by quinquennial periods:

TABLE III.—SUICIDES IN 100 AMERICAN CITIES, 1894-1913.

Years.	Population.	Suicides.	Rate Per 100,000 Population.
1894	14,009,143	2,123	15.2
1895	14,509,040	2,204	15.2
1896	14,996,618	2,349	15.7
1897	15,384,527	2,571	16.7
1898	15,859,608	2,621	16.5
1899	16,235,080	2,590	16.0
1900	16,756,990	2,726	16.3
1901	17,251,169	2,850	16.5
1902	17,745,361	3,143	17.7
1903	18,239,573	3,511	19.2
1904	18,733,793	3,762	20.1
1905	19,254,710	3,647	18.9
1906	19,837,889	3,536	17.8
1907	20,421,084	3,969	19.4
1908	21,004,288	4,582	21.8
1909	21,587,499	4,531	21.0
1910	22,170,708	4,377	19.7
1911	22,756,723	4,453	19.6
1912	23,334,475	4,397	18.8
1913	23,917,482	4,470	18.7
1894-1898	74,758,936	11,868	15.9
1899-1903	86,228,173	14,820	17.2
1904-1908	99,251,764	19,496	19.6
1909-1913	113,766,887	22,228	19.5

"As far as it is possible to judge, a maximum figure for American cities was attained in 1908, when the rate reached 21.8 per 100,000 of population. The rate of 18.7 for the year 1913 was the lowest on record since 1903, with the exception of 1906. A diminishing suicide rate may be safely assumed to reflect in a general way an improvement in the social and economic condition of the country, and in this respect the evidence available is quite conclusive that the year 1913 was one of widely diffused prosperity. * * *"

*Per cent of deaths from suicide to the mortality from all causes at each age period.

†Table for 100 American cities omitted.

Insurance in Canada in 1913.—"The Insurance Record," of London, in a recent issue gives the following survey of insurance in Canada during the year 1913:

The report of the Superintendent of Insurance of the Dominion of Canada for the year ended December 31, 1913, is, as usual, a careful and exhaustive compilation of statistics, prefaced by information of a highly interesting character. To students and others who may have but an imperfect knowledge of the Canadian offices and the magnitude of the business transacted in the Dominion this report will bring much enlightenment, while it is instructive also as showing the results obtained by British, American and other companies in the great colony which has been called "The country of the future." The report fills two volumes (or "Blue Books"), the first dealing with fire and casualty insurance, the second with life assurance. During the year 1913 fire insurance business was carried on by 84 companies in Canada, of which 29 were Canadian, 24 British, 29 United States and 2 French. There were five new competitors in the field, one of them British (viz., the Marine Insurance Company, which during the year received a license for fire insurance, in addition to its previous powers, but did not actually transact fire business), and five fell out of the ranks—four Canadian companies having discontinued business and another having had its license withdrawn. The total amount received for premiums was $25,745,947, of which $5,099,298 was taken by Canadian offices, $13,138,597 by British and $7,508,052 by United States and other offices. The most favorable experience was that of the British companies, whose loss ratio was 52.82 per cent, as against 52.26 per cent in 1912; but the United States and other offices were nearly as fortunate with a loss ratio of 53.86 per cent, as compared with 50.82 per cent in 1912, while the Canadians had to pay away 59.23 per cent of their premiums in losses, or 5.28 per cent more than in the previous year. The total amount paid by all companies was $14,003,759, or 54.39 per cent of the total premium income, as against 52.25 per cent in the previous year. It is a significant fact that this ratio for 1913 is 7.30 per cent less han the average ratio for the forty-five preceding years.

Casualty insurance business was carried on in Canada during 1913 by 68 companies, of which 26 were Canadian, 13 British and 29 United States companies. The business was of the usual miscellaneous character, including employers' liability, personal accident, guarantee, sickness, plate glass, burglary, steam boiler, automobile, weather insurance, title insurance, sprinkler league insurance, live stock and inland transportation. Of the more modern forms of indemnity we note that automobile insurance was carried on by 22 companies (four of them British), the premiums received being $563,204; but the competition in burglary insurance is apparently not so great, as it is carried on by only 7 companies—one of them British—with premium receipts of $75,580. The total amount received in premiums for casualty insurance was $9,272,076, of which British and Colonial offices took $3,165,600. Life assurance business was transacted by 45 active companies of which 27 were Canadian, 7 British, 1 Colonial and 10 American. The total amount of new assurance for 1913 was $231,608,546, showing an increase of $12,403,443, over the corresponding total of the previous year. The Canadian offices wrote $9,774,014 less than in 1912, and the British companies' figures also show a falling off to the extent of $369,257, though in the preceding year they indicated a substantial increase. For the time being it is the American offices that are going full steam ahead, and their new business in Canada in 1913 was $22,546,714 in advance of that of the previous year. Nevertheless, the offices of the Dominion still obtain the greatest amount of support in the land of their origin. Last year they issued policies for $131,493,582, as compared with assurance for $93,164,269 granted by United States companies and policies for $6,950,695 by British offices. A table showing the advance of life business in Canada since the year 1875 is very suggestive and encouraging. The total amount of insurance effected in one year has risen from $15,074,258 in 1875 to $231,608,546 in 1913, and the huge increases effected in recent years indicate that a period of irresistible growth is in progress.

* * *

Commissioner Ekern's Ruling on the War Revenue Tax.—Insurance Commissioner Ekern, of Wisconsin, has issued the following ruling in regard to the paying of the newly imposed Federal war revenue tax. The ruling, of course, applies only to policies issued in the State of Wisconsin:

Ruling.

Sections 1941-43, 19550.

Federal Taxes on Fire Insurance Policies.

The stock fire insurance companies are required to pay the stamp tax on policies imposed by the new United States Internal Revenue Tax Law. The insured cannot be required by the company to pay the tax or furnish the stamp. He can be required to pay only the premium which must be written in full in the Standard Fire Policy as required by Section 1941-43 of the Wisconsin statutes. If the company attempts to impose this tax upon the insured, the agent cannot pay it without violating the anti-rebate law, Section 19550.

(Signed) HERMAN L. EKERN,
Commissioner of Insurance.

Madison, Wis., Dec. 1, 1914.

Accompanying this ruling, Mr. Ekern has sent out the following memorandum, stating the reasons which have led him to come to his conclusion:

Memorandum.

The intent of the new internal revenue law is that the tax shall be paid by the companies. The company and the agent are punishable by fine for issuing an unstamped policy.

There is no penalty upon the insured for accepting such policy. He is not subject to fine. The validity of evidentary value of his policy is not affected. The prohibition in the old act of 1898 against the use of an unstamped contract in evidence is omitted from the new act.

The provision in the new act that the tax shall be paid by the person for whose use and benefit the instrument is made plainly applies to an instrument which must be stamped to be recorded. This does not apply to an insurance policy.

The fact that a tax on insurance over which the Federal government exercises no jurisdiction or control may be wrong in principle, does not justify the stock fire insurance companies in requiring its payment by the policyholders.

The Wisconsin Standard Fire Policy law requires that the premiums shall be stated in the face of the policy. (Section 1941-43.) This premium is the payment required by the company to be made by the insured. The policy cannot be changed, varied, or added to by any matter not authorized by statute, and no addition of the premium tax or separate contract referring to it is authorized by statute. (Section 1941-64.)

The company and the agent are forbidden to make any contract or agreement other than is plainly expressed in the policy. The giving of any rebate of the premium by the agent is prohibited. (Section 19550.)

While the legal question is decisive, the financial and economic question raised by the argument made by the National Board of Fire Underwriters and some of the companies that they are losing money demands comment.

The stock fire companies certainly are not losing money in Wisconsin. During the ten-year period they collected from Wisconsin policyholders over $37,500,000 net premiums in excess of paid losses and the increase in reserve. They paid in losses only $42.80 for each $100 in net premiums, against United States losses paid of $56.30 for each $100 of net premiums. Taking the five-year period, 1909-13, which eliminates the San Francisco conflagration, these companies returned to policyholders in the United States $52.30 against only $43.70 losses paid to Wisconsin policyholders for each $100 in net premiums, and against only $38.20 in 1912 and $34.40 in 1913 of net losses paid Wisconsin policyholders for each $100 of premiums.

Neither are the companies losing money on their business as a whole throughout the United States. Their statements of underwriting profits and losses omit the interest earned on the assets. Roughly, one-half the assets belong to the stockholders and one-half to the policyholders, and this interest income is the greatest source of profit. Without any profit from underwriting, the companies' rate of profits on all investments in capital and surplus will be double the rate of interest earned on the assets, as the stockholders take the earnings on their own money and on the policyholders' money. Thus, the National Board statements emphasize an underwriting loss of $16,775,237 for the ten years from 1904-13, while the fact is that during this period, including the San Francisco conflagration year, on an average capital stock of about $80,000,000, the stockholders received $65,000,000 more in dividends than they paid back into surplus.

The exact figures for practically the same stock fire insurance corporations reporting to Wisconsin for the ten years are:

Net premiums		$2,445,697,711
Net losses paid		1,377,452,748
Gain in surplus		65,882,591
Dividends paid	$176,368,258	
Contributions to surplus	115,476,824	
Net dividends paid		60,891,434
Average capital stock		72,548,926
Average surplus		141,638,663

The average annual dividend, including the San Francisco conflagration year, was thus 8.39 per cent on the capital stock, or 7.84 per cent on the combined capital and surplus. The average annual stockholders' gain (in dividends paid and increased surplus) was 17.5 per cent on the average capital stock, or 5.9 per cent on capital stock and surplus.

The more normal last five-year period, 1909-13, shows largely increased profits, notwithstanding the great shrinkages in values of securities in 1913.

Net premiums		$1,322,827,514
Net losses		681,893,514
Increase in surplus		51,851,596
Dividends paid	$100,470,369	
Contribution to surplus	20,747,466	
Net dividends paid		79,722,903
Average capital stock		79,003,543
Average annual surplus		167,400,492

During the five-year period the average net annual dividend was 20.11 per cent on the capital stock, or 6.48 per cent on the capital stock and surplus. The average annual stockholders' net gain (in dividends and increased surplus) was 33.3 per cent on the capital stock or 10.68 per cent on the combined capital stock and surplus.

During the ten-year period the average annual stockholders' gain (in net dividends and increased surplus) was 5.18 per cent of the net premiums or 9.2 per cent of the losses paid. During the five-year period the same gain to stockholders was 9.95 per cent of the net premiums paid by policyholders, or 19.3 per cent of the losses paid to the insured.

This is not all. During the five-year period the increase in unearned premiums was $49,217,147, which at the 30 per cent used by the New York Fire Investigation Committee contains an added profit of $14,765,144. This makes the total gain to stockholders (in net dividends, increase in surplus and the 30 per cent increase of unearned premiums) $146,339,743, which was an average 11.07 per cent of the net premiums, or 21.5 per cent of the net losses paid.

This is what it has cost the policyholders for the use of the stockholders' capital and surplus. Taking the stock fire insurance business in the United States as a whole, even through a period involving insurance losses of $150,000,000 in the largest conflagration known, the companies and stockholders have made a large profit. With the San Francisco losses now recouped, the gains should be reduced rather than increased. There is no excuse for adding the one-half per cent Federal tax to the policyholders' premiums.

Annual Meeting of Association of Life Insurance Presidents.—The preliminary announcement of topics and speakers at the eighth annual meeting of the Association of Life Insurance Presidents, to be held in New York City on December 10-11, 1914, is as follows:

Mr. Jesse R. Clark, chairman, president Union Central Life Insurance Co., Cincinnati, O.

The Common Interests of Life Insurance, Education and Business.

"Relation of Life Insurance to the Credit Fabric of Business," by Hon. A. Barton Hepburn, chairman of board of directors, Chase National Bank, New York.

"Response of Our Educational Institutions to Present-Day Business Needs," by John H. Finley, LL.D., State Commissioner of Education, Albany, N. Y.

"The Increasing Need for Insurance of Women," by Mr. Herbert C. Cox, president Canada Life Assurance Co., Toronto, Ont.

"In re Prevention of Verdict Before Trial in Life Insurance Cases," by Mr. W. H. Davis, general counsel Pacific Mutual Life Insurance Co., Los Angeles, Cal.

"Safety First in Life Insurance," by Mr. John B. Lunger, vice-president Equitable Life Assurance Society, New York.

"The Insurance Department as an Educating Force," by Hon. J. S. Darst, president National Convention of Insurance Commissioners, Charleston, W. Va.

"Some Observations on Supervision," by Hon. Frank Hasbrouck, Superintendent of Insurance, Albany, N. Y.

"The Relation of Sanitary Engineering Works to Public Health," by Mr. Rudolph Hering, sanitary and water supply engineer, New York.

"Live a Little Longer—The Rochester Plan," by Miss M. E. Bingeman, Rochester, N. Y.

"Can Insurance Experience be Applied to Lengthen Life?" by Mr. Arthur Hunter, actuary New York Life Insurance Co., New York.

Fireside Campaigning.

Opening Address: By Mr. R. W. Stevens, vice-president Illinois Life Insurance Co., Chicago, Ill.

Following Mr. Stevens' address there will be a general discussion on the subject of "Fireside Campaigning." Every member and guest is urged to come prepared to say something on this vital subject, if only to speak for two or three minutes. There will be a limit of six minutes for each participant, so that time may be provided for every one who brings a message.

("Insurance News in the West" and "Items of Insurance News" will be found on pages 735 and 736.)

FINANCE AND COMMERCE

Financial and Commercial Review.

Banking Situation at Home and Abroad.

Statistics of Cotton and Coffee.

Market Prices of Securities and Commodities.

WALL STREET has been the place of marked progress in the past week or, speaking with a more strict regard for Wall Street functions, the place where progress in banking and business recovery has been most strikingly reflected. It looks now as though it would only be a little while before the country's primary securities market would be restored to some semblance of normal working order and when this occurs the rehabilitation of the economic machinery will be completed. The indications are that irregular processes of improvement in values and volumes, financial and commercial, will then get under way. Unless we mistake the temper both of the American people and of the leaders of affairs a determined effort is going to be made to take every economic advantage which the position of the United States offers in the circumstances of the war abroad, and no matter what the ultimate result of the war may be the American advantages are great.

Wall Street events of the last few days suggest that the stimulus to a forward business movement is even now being prepared in the securities and money markets. The mere resumption of open dealings in the organized securities market has tended to provoke an optimistic sentiment which is bound to be promoted as it is found possible to resume open trading in stocks. Probably until the Interstate Commerce Commission makes its decision in the Eastern rate case it will be found necessary to maintain restrictions on transactions on the New York Stock Exchange, and all the other minor markets will take their cue from it. Even though the Commission's ruling be favorable to the contentions of the railroads and the hopes of the investors, the stock market will probably have to remain under an unusual degree of authoritative control at least until there is a definite turn in the war which is prophetic of the outcome.

It might be noted though that in the financial district there is a growing feeling that apprehension about the quantitative urgency of foreign liquidation of American investments has been exaggerated and the belief is gaining ground that the securities market will be able almost to take care of itself in the continuing adjustments of values which the contingencies of the war will require. It is thought, moreover, that the banking position and the money market is nothing like as subject to violent derangement as was feared only a month or so ago. The whole world has become more or less accustomed to the fact of the war. It has seen with what impressive ability the financial situation has been righted. It has seen huge war loans floated with remarkable celerity and it has before its eyes the spectacle of a vast plethora of bank credit which can take up and absorb a great deal of financial strain sudden or otherwise.

For the time being the bond market derives support from the increasing ease of money. The most important aspect of business in bonds is not their price level just now, but the evident lack of selling pressure which may also be owing to the level of bank rates. In the long run, unless the economic doctors are all wrong, the quoted values of bonds will decline from their present range in order to bring their yields up to parity with the price which capital will command for new uses. A significant token in this regard is furnished by the terms on which foreign borrowing is being done here. France, Sweden and Norway have negotiated loans of moderate amounts which have cost the borrowing countries upwards of 6 per cent. In all likelihood, however, the readjustment of bond prices to the long distance outlook will be gradually effected without severe disturbance of financial positions. The fact that foreign countries are coming here for money is one of the striking developments of late and is auspicious for our future. There will be more of this business as time goes on and the beginnings of it show that the American banking community is getting into world finance. In the war and its aftermath New York may come very close to attaining the eminence as a world money market which patriotism has occasionally been inclined to predict for it.

In the aspects of stocks observers find reasons for taking a hopeful view of general business chances of comparatively early recovery. In the first list of prices officially sanctioned by the Stock Exchange authorities since the Exchange closed its doors last July, seventy stocks were quoted and almost all of them exhibited substantial gains over the closing quotations on July 30 last. Responding more to the visible cheapening of borrowable funds than to anything else, shares in every market in which they are being dealt in have been displaying rallying or rising tendencies and, if the discounting operations of the stock market are to be accepted, both speculators and investors are now anticipating material betterment in the field of trade and industrial activities where the values which underlie quoted values are created.

Even at this stage the combined influences of the money and securities markets have started at least a sentimental change for the better in basic lines of business, as in the iron and steel trade. From the point of view of employment and profits we have a hard Winter ahead, but if the funds with which bankers have on their hands in uncomortable sufficiency begin to seek employment the end of Winter will not be reached before business men report everywhere that trade is picking up. Every concern that gets some of the foreign orders for supplies which are being placed here is a centre of potential general business improvement in its locality and foreign trade recovery, which gave November an export balance of more than $70,000,000, compared with $57,000,000 in October, must have beneficial domestic reactions all around. It takes time to get business going after the machinery of finance and commerce has all been knocked to pieces, but machinery has been practically set up again and general business activity seems to be now only a question of time.

When the New York Clearing House Association announced this week that all the clearing house certificates issued by way of emergency measures had been retired a traditional sign was given that the period of critical strain had passed and that financial equilibrium had been restored. More of these certificates were taken out and were outstanding at one time than ever before, but their retirement was much more quickly effected. Retirement of not far from half of the total emergency currency issued by the National banks of the country and the fact that in no city are there any clearing house certificates which have not been redeemed or called for redemption testify to the completeness with which the banking conditions have recovered from derangement.

Corroborative evidence is furnished by the rates for bank accommodation which cannot be called prevailing rates because of their persistent downward trend. Call loans have been negotiated in Wall Street on Stock Exchange collateral at 3½ per cent and

time money and commercial paper may be quoted as ranging around 4½ per cent. It is just as necessary as it ever was for a borrower to have excellent credit in order to get the lowest terms for accommodation and bankers are anxious to be conservative, but the most interesting question of the moment is how long banking conservatism will be able to refrain from forcing credit on borrowers. The artificial measures resorted to in British war finance have made money almost unlendable at London. In this country the money market is in a state of absolute glut as a result of the establishment of the Federal Reserve Banking System and the coincident reduction of statutory reserve requirements.

Perhaps because the banks are going to have infinite trouble in finding employment for their funds and because the open market rates for money are tending lower all the time, there is no danger that the Federal Reserve Board can or will do anything now which will store up trouble to be dealt with later on. It looks very much as though the Board would have to let the Federal Reserve machinery stand more or less idle for a protracted period. Certainly if the Board takes counsel of banking judgment it will see no way to put the reserve banks in line to earn expenses by rediscounting or by open market operations. Whatever the reserve banks do under the present circumstances of an unprecedented excess of reserve holdings by the banks of the country as a whole will only have the effect of cheapening the rates for credit and increasing the market supply of money.

What the Reserve Board may attempt as a result of other than banking considerations is a different question. A session of Congress is about to open which promises to be full of discontent and because of its business basis discontent may converge on the Treasury. The administration of the Treasury has been such as to cause expectations that on the least possible excuse, or on no excuse at all, some financial novelty will be espoused by Mr. McAdoo, and the strength of Treasury influence in the Federal Reserve Board was one of the dangers foreseen at the very beginning of currency legislation last year. This danger has been emphasized recently. Although it is outside of its duties, the Board has been involved in the McAdoo Cotton Loan Fund to the extent of undertaking its general supervision. This is quite in keeping with the conceptions of the Federal Reserve System which President Wilson and Mr. McAdoo have formed. Mr. McAdoo regards the Federal Reserve Banks as a branch of the Treasury and Mr Wilson has told his Secretary of the Treasury that in the reserve bank system "You have a new instrument at hand."

London	22¾	22⅞	22 13-16	23 1-16	23 1-16	23

COTTON

December 5, 1914.

ALL the conditions of the time combine to make the volume of trading in cotton far smaller than normal, and consequently the impression given by the markets is one of extreme inactivity. During the past week this was particularly the case, because little is now left unliquidated of the business held over perforce from the last weeks before the outbreak of the war, while the initiation of new business, in the midst of all the inevitable uncertainties to be faced by dealers, is necessarily slow. The truth of course is that the lack of precipitancy about entering into new commitments is one of the most wholesome features of the trade at present; but the want of energy and animation in the markets must also be admitted to have its trying side. None the less, the past week has really shown the most decided enlargement of new business which has been seen since the re-opening of the cotton exchanges. It has become manifest that the world is really coming back to the cotton exchanges and is actually buying and selling cotton for commercial purposes, even though on a very moderate scale as yet. In the New York Cotton Exchange orders of spinners have begun to appear, on the one side, and the orders of cotton merchants hedging their purchases of cotton, on the other. Liverpool firms are resuming their arbitrage buying and selling, and are showing both willingness and ability to acquire stocks of cotton, protected by sales of future contracts either in their own market or in the American markets. Some fresh business is appearing from the Continental countries not involved in the war; and, curiously enough, there has been some buying of contracts in New York for both German and Austrian account. Actual cash to protect these last commitments is understood to have been forwarded to New York banks. This German and Austrian buying is all the more noteworthy because as yet all the efforts to get cotton started for German ports direct have proved unavailing. No less than three ships fully laden with cotton are understood to be lying still in American ports, despite the assurances conveyed by the British Government to our State Department that cotton in neutral bottoms will not be interfered with by war vessels of the Allies, even though cleared direct for Germany or Austria. The hitch now is reported to be not so much the impossibility of obtaining marine insurance as the unwillingness of crews to face the dangers of mine fields in the North Sea and in the Adriatic. Yet, as stated above, there is little doubt that Germany and Austria are both beginning to contract for cotton for future delivery, especially for the late Summer and early Fall of 1915. Some in the cotton trade surmise that this fact may be of significance in respect of the probable duration of the great war. It has been noted in New York that there appear to be in the market numerous orders to purchase October (1915) contracts on a scale down from 8 cents per pound. This would appear to indicate that as the season progresses larger and larger quantities of contracts will be entered into for the delivery of cotton a year or more hence. It is unnecessary to remark that such buying will take care of the surplus of the present season's production just as effectually as would a present demand for the actual cotton in the South; for merchants will buy the actual cotton, as the producers get ready to sell it, and will sell these distant deliveries, on a proper parity, as a hedge. As it more and more perceives the initiation of this economic process, the cotton trade grows to fear less and less a further disastrous decline in the price of cotton. Provided the Southern farmers continue to show the courage they are now displaying in selling no cotton except under the stress of actual necessity, and provided these farmers intelligently accommodate their cotton acreage next Spring to the obvious requirements of the situation, there is little reason to anticipate that their average price for this year and next together will fall far below the cost of production, if indeed it does not equal or exceed it. Meantime, the cotton trade is interested to ascertain at the earliest possible moment the probable size of the present crop, with its corollary of the probable amount of surplus cotton that must be reckoned with. It has been deduced from the record-breaking ginning figures issued by the Census Bureau on November 21 that the crop must exceed the 16,100,000 bales of the season of 1911-1912. The trade, however, is well aware of the variation from year to year in the rapidity of ginning, and it is accordingly awaiting the annual crop estimate of the Department of Agriculture, to be issued next week. The only indication from official sources as to what this estimate is likely to be is to be found in "Farmers' Bulletin 641", just published by the Department of Agriculture. There it is stated: "With the exception of 1911, the cotton crop of 1914 is the largest on record. The 1914 crop, from conditions on September 25, is expected to be about 15,360,000 bales of 500-pounds, gross weight. This estimate does not include linters, the production of which has averaged about 600,000 bales for the past three years." Independent crop students, on the other hand, incline to somewhat higher figures, as a rule. Miss Kate M. Giles puts the crop at 15,780,000 bales, exclusive of linters, or about 16,400,000 bales with linters. The New Orleans "Times-Picayune" has issued an estimate of 15,750,000 bales, exclusive of linters. The average estimate of members of the Memphis Cotton Exchange is 15,529,000 bales, exclusive of linters. The Memphis "Commercial-Appeal," however, has arrived at the lower figure of 14,988,000 bales excluding linters. Even after all the estimates of production are made, on the other hand, there will still remain some question as to how closely the last of the crop will be picked.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 21, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Receipts at ports	444,905	452,993	376,640	341,151
Overland to mills and Canada				
Interior stocks in excess	18,492	61,431	60,785	43,781
Southern consumption				
Total receipts	140,000	100,000	105,000	90,000
Total to mills and exports				
Net overland to Jan. 1	36,661	38,887	54,163	38,064
Southern consumption to Jan. 1	170,000	653,311	596,588	512,996
Total Movement—				
Total to Jan. 1	6,173,917	6,141,768	5,980,712	3,099,589
Overland to mills and Canada				
Charged	313,955	387,459	447,915	302,321
Southern consumption	313,955	1,159,873	1,159,796	757,887
Total overland to Jan. 1				
Interior stocks in excess	717,917	581,330	638,998	965,260
Total crop to Jan. 1				
Total crop movement	8,225,241	8,216,430	8,227,421	5,125,057

The total crop movement is respectively for 130 days, 128 days, 127 days and 128 days.

The Cotton Trade in India and the War Crisis.—A special meeting of representatives of the various associations in Bombay interested in raw and manufactured cotton was held at the Bombay Chamber of Commerce on October 8, writes United States Consul Baker, of Bombay, for the purpose of discussing the present crisis in the cotton trade in India and formulating some plan for relieving the situation. At the request of several of the interests concerned, this office prepared a memorandum in regard to the efforts being made in the United States to store and finance the cotton surplus. The data were obtained from the latest American newspapers received at this office. This memorandum was read at the meeting and excited much interest. It led to the sentiment being strongly expressed that India, like the United States, will find it necessary to give very serious attention to any reasonable plans for helping cotton producers through the present crisis.

The chairman, in his opening remarks, explained that the stocks of imported piece goods now in Bombay amount to nearly 150,000 packages, which, at an average cost of $133, would have a value of $19,950,000. The stocks of country-made cloths in Bombay are estimated at 250,000 to 300,000 bales, and of yarns, at 100,000 bales. Turning to the raw material, he said that old-crop stocks amounted to something like half a million bales, while from all accounts the new Indian crop promises to be very large and the American crop a record one. On the other hand, the demand for raw cotton would be greatly reduced as a consequence of the war, and it follows that the price of cotton must rule low for some time to come.

He mentioned that the cotton crop of the next season, on account of the reduced acreage resulting from the persent situation, would be greatly reduced, and that in his opinion there ought to

be some way of averaging the prices of the two seasons, so as to avoid needless dislocation of trade and loss to the country. He said that the value of the Indian cotton crop of last season may be estimated at about $200,000,000, and though the yield of the present season is likely to be fully as large, the return to growers will be far less. The Indian cotton grower must now sell a good deal of his cotton as soon as it is ready in order to pay his taxes and provide the necessaries of life. If he has to sell it at a loss, it will be difficult for him to meet his liabilities; moreover, if he becomes panic-stricken over the fate of his cotton crop this year, he may hesitate to run the risk of free planting when normal times return.

The chairman stated that although it is no easy matter to formulate a plan that would be effective and easy to work under the conditions prevailing in India, yet the most promising would be to have the Government accept custody of cotton and issue warrants against it. It would be an easy matter for warrant holders to obtain loans and advances on such convenient and undoubted securities, and an additional advantage would be that the lenders themselves could raise money on them if they so desired. This should make them a very attractive investment, not only to banks, but to private individuals who want a temporary investment; and investors would have the satisfaction of knowing that while doing themselves a good turn they would also be helping the country.

A resolution was passed as follows: "That this meeting is of opinion that immediate steps should be taken with a view to preventing any unnecessary decline in the price of cotton, and requests the co-operation of the Government in such measures as may be found practicable for the storing and financing of the surplus crop of the season."

A committee was then appointed to negotiate with the Government with a view to giving effect to the resolution.

THE COTTON TRADE AND THE EUROPEAN WAR CRISIS OF 1914

(Continued from Page 714.)

for years past by leaps and bounds and may be put now at well over 15,000,000 bales, provided trade and industry are following their normal course. For the average of seasons we are not able to do better than keep up with the increase of the world's consumptive demand; and a happy result of this is that the production of cotton has been kept profitable by a highly remunerative price. The rapid economic advance of the entire South during the past decade bears witness to this fact. More than this, the production and distribution of cotton have been "stabilized",—to use a word now coming into favor,—in the sense that all those having to do with it, whether producers, merchants, manufacturers or bankers, have seen its value maintained year after year in such wise that operations involving cotton have a high degree of calculability. The vicissitudes of Nature, giving us an over-abundant production in one year, following upon a somewhat deficient production in a previous year, have ceased to be disturbing, and the mere existence of a very large supply at a given moment is no longer thought of as a necessary cause for a severe depreciation in price. Hence, had it not been for the rapidly developing effects of the war, there would have been nothing alarming about the prospect of a record-breaking production of cotton in the United States this year. Some decline in price would naturally have been expected, but certainly no ruinous decline. In other words, cotton to-day has in the minds of those dealing in it a permanent intrinsic value, independent of the daily or seasonable fluctuations of its market price; and this intrinsic value is the ascertained cost of production, in an economic sense, which is somewhat above 10 cents per pound on Southern farms or somewhat under 11 cents per pound for the cotton delivered at American ports. The cotton trade now calculates upon the steady maintenance, over a period of years, of market prices in consonance with this economic cost of production; and the consuming world has shown itself to be content with these prices. It is this opinion of the cotton trade and this acquiescence of the consuming world that have become the basis of all the usual expectations of the producers of cotton as to the return from their crops, and of the country as a whole, and particularly of the regulators of the country's domestic and foreign credit, the bankers, as to the part which cotton may be counted upon to play in the annual liquidation of all manner of indebtedness at home and abroad.

The catastrophe of the European War seemed to upset in a moment all these accepted opinions. The very fact that these were as a rule simply accepted, and not thought out to the point of conscious conviction, made the shock all the worse. The first visible result of the war was that cotton could not be exported as usual, and its proceeds could not be used for the settlement of indebtedness due at fast approaching dates. Then alarm was occasioned by the swift perception that, for the period of the war at least, there must be a severe reduction in the world's consumption of cotton. Millions of bales were assumed to be destined to remain not only unconsumed but also unsold and unsalable. Figures were made up and circulated, showing the immense loss of value which the country must face on this account, and the immense burden which must be carried by some one until the restoration of peace in Europe. And then the period of expedients, political and other, began. It is unnecessary to rehearse here the succession of projects for raising huge sums of money by public loans and otherwise for the relief of the situation. The newspapers have been filled with accounts of these projects, as one after another they have had their day. Not one of them has as yet proved itself to be valuable; and it must be confessed that nothing in the experience of the cotton trade leads it to think that any one of them will hereafter prove valuable. It has no confidence whatever in any plan for withholding cotton from the market, gathering it together and segregating it and borrowing money on it. The cotton trade believes that any surplus of cotton may be permanently and satisfactorily disposed of only by distributing that surplus over future years, and the machinery of the cotton exchanges has been devised by the cotton trade for that very purpose.

And at last the problem has come back into the hands of the cotton trade, at first despised and rejected. Through the instrumentalities of the cotton trade, and particularly through the facilities afforded by the cotton exchanges for distributing a present surplus of cotton over the fuutre, instead of keeping it a heavy present burden alleviated only by the gradual withdrawals of restricted users, the heavy surplus of this year's cotton crop of the United States is now in process of distribution, with no more ruinous decline in its value than has attended other super-abundant crops within the past decade and a half. The individual cotton producers, and the country as a whole in its capacity of the greatest producer of cotton in the world, must expect to pay a part of the price for the destructive instead of constructive activities of the nations of Europe; but there is now no reason to expect that the result for us will be a long-continued grievous depreciation of the value of our greatest international commodity. Within the little more than two weeks since the cotton exchanges were re-opened, no inconsiderable portion of this year's cotton crop has already been sold for delivery from one to two years hence. This process will continue with continuous acceleration. It is thus that the cotton trade will accomplish in good time what all the hastily devised and commercially inexpert expedients have been ineffective in bringing about.

INDUSTRY, COMMERCE AND FINANCE

Federal Reserve System Consolidated Statement.—The Federal Reserve Board, at Washington, has issued a consolidated statement of the condition of the twelve Regional Reserve Banks at the end of each of the first two weeks of the operation of the system. It is as follows:

CONSOLIDATED STATEMENT OF CONDITION OF THE TWELVE REGIONAL RESERVE BANKS.

ASSETS.

	November 20.	November 27.
Gold coin and certificates	$203,415,000	$227,840,000
Legal tender notes, silver certificates and subsidiary coin	37,308,000	34,630,000
Total cash	$240,723,000	$262,470,000
Rediscounts and loans	5,607,000	7,383,000
All other resources	95,000	165,000
Total resources	$246,425,000	$270,018,000

LIABILITIES.

Capital paid in	$18,072,000	$18,050,000
Reserve deposits	227,138,000	249,268,000
Federal Reserve notes in circulation	1,215,000	2,700,000
Total liabilities	$246,425,000	$270,018,000
Gold reserve against all liabilities	89%	90%
Cash reserve against all liabilities	105%	104%
Cash reserve against all liabilities after setting aside 40% gold reserve against Federal Reserve notes in circulation	105%	103.70%

The resort to the Reserve Banks by the member banks for rediscounts shows but a trifling increase,—$1,676,000,—in the second week of operation over the first. The total amount of rediscounts at the end of the second week ($7,383,000) remains trivial in comparison with the immense resources of the banks in the aggregate.

The following table shows the several amounts of rediscounts,—or, as the statement calls them, "rediscounts and loans,"—for the twelve Banks, on November 27:

REDISCOUNTS FOR THE SEVERAL RESERVE BANKS.

	Nov. 27.		Nov. 27.
Boston	$216,577	Minneapolis	$175,000
New York	2,715,476	Kansas City	392,765
Philadelphia	880,000	Dallas	172,799
Cleveland	None	St. Louis	1,073,000
Richmond	113,352	San Francisco	129,458
Atlanta	4,963		
Chicago	1,509,610	Total	$7,383,000

A point of interest in connection with the table just given is that the Southern member banks are apparently making no use of the rediscount facilities of their Reserve Banks for the financing of cotton, despite the supposed pressure for accommodation for this purpose. The total rediscounts at Atlanta do not represent the value of 200 bales of cotton; and those at Dallas do not represent the value of 5,000 bales. Evidently, the readjustment of the cotton business to the new banking methods has not yet been even begun.

* * *

Commerce of Salvador for 1913.—The total foreign commerce of the Republic of Salvador for the year 1913, according to the report of the Director of the Bureau of Fiscal Accounts, Senor Don Bernardo Arce, amounted to $6,173,544.84 gold, imports; and 23,527,781.54 colones silver, exports.

Estimating the colon silver at 42.2 cents United States gold, the exports would amount to $9,928,723.81, and the total trade to $16,102,268.65.

The statistics of foreign trade for the year 1912 were: Imports, $6,774,859.43; exports, $9,942,184.32 (22,341,987.23 colones silver, converted on the basis of 44.5 cents); total trade, $16,717,043.75.

There was, therefore, a decrease for the year 1913 as compared with the preceding year of $601,314.59 in imports, and on the basis of the conversion as above made of $13,460.51 in exports, or a total decrease in the foreign trade of $614,775.10.

* * *

The Production of Metals in the United States in 1913.—Comparative statistics of metals produced in the United States in 1912 and 1913 are now available. The following tables give the value and the production (in short tons) of the principal metals, as compiled by the United States Geological Survey:

UNITED STATES PRODUCTION OF METALS, 1912 AND 1913.

1912.

Metals.	Production from Domestic Ores. Short Tons.	Value.	Production from Foreign Ores, Matte and Unrefined Bullion Smelted or Refined in the United States. Short Tons.	Value.	Total Production. Short Tons.	Value.
Iron (pig*)	32,458,938	$402,378,453	1,343,747	$18,184,935	33,802,685	$420,563,388

*Marketed production.
†Includes marketed production of ferrosilicon, ferrophosphorus, ferrovanadium, ferrotungsten, ferromolybdenum, ferrotitanium.
‡Nickel content of imported matte and ore.
§Includes foreign. Figures are consumption, not production.

INSURANCE NEWS IN THE WEST

The Attitude of the West on the War Revenue Tax.—The question of who shall pay for the revenue stamps on fire insurance policies is stil the most live one in the West. On Tuesday the Chicago Board of Underwriters passed resolutions setting forth the reasons why its members believe the companies should pay the tax. Among these it is stated that attempts to make the assured or the agents pay it will increase the friction between these classes and the companies, which already is too marked. Copies of these resolutions will be sent to Chicago men in Congress with the request that in drafting any more measures of this sort pains be taken to make it clear who is to pay the tax.

Agents continue to protest and assured certainly do not like the National Board rule. Insurance Commissioner Ekern, of Wisconsin, has made a ruling that will make it difficult to collect the tax from the assured in that State. The joint conference committee of the Western Union and the Western Insurance Bureau has held several sessions on this question and early in the week it was reported that a member of the National Board's committee on laws and legislation would be in Chicago shortly to take the question up.

It is known that many Western managers were opposed to making the assured pay the tax from the start. It is in a sense a repetition of what happened when the Eastern offices ordered the 25 per cent flat advance in fire rates after the Baltimore fire of 1904. The Western managers were opposed to that, but had to bend before superior authority. The opinion is held in some quarters that since there has been such opposition to the National Board's plan in the West, that body would recede from its position were it not that it thinks it would be bad policy to appear to bend to the protests of the agents.

One peculiar feature in the situation is the fact that while the fire companies are demanding that the assured pay for the stamps the casualty companies, which several of these same fire companies control, are affixing the stamps to their policies before they leave their offices and are paying for them themselves.

Several interesting questions already have been referred to home offices of casualty companies by their Chicago representatives, with the request that they get rulings on them. For example, when a pay roll audit shows that excess premium is due, the company bills the assured for the amount of premium due. When the bill is paid it is simply receipted, no formal document, like a renewal receipt, being given. Are the stamps to be affixed to the receipt? When a liability or workmen's compensation policy is issued on a small deposit premium, with monthly or quarterly payments to be made after audits of pay rolls, on what is the tax to be paid and to what document are the stamps to be affixed?

The situation is materially complicated in Chicago by the inability of the collector of internal revenue to furnish stamps enough. On Tuesday the police had to be called to handle the crowd that besieged his office clamoring for stamps. It is stated that it will be three weeks before all wants can be supplied.

* * *

Resignation of Mr. George H. Moore.—Assistant Western Manager George H. Moore, of the Liverpool and London and Globe, has resigned as of January 1 because of ill health. He has been in the company's service for more than thirty years. Hugh R. Loudon, deputy assistant manager, has been promoted to assistant manager, and R. H. Purcell, who has been a field man of the company in the mountain district, has been given Mr. Louden's old position. Until a few years ago, when he was called to Chicago to take the position from which he has just been promoted, Mr. Loudon was State agent of the company in the Northwest. He made good there and he has done so as deputy assistant manager. He is modest and has not thrust himself forward, but has proved his ability to perform every duty which has been assigned to him. Mr. Purcell recently has been helping in the Western department office at Chicago.

* * *

New Compensation Mutual in Nebraska.—Even before the workmen's compensation law of Nebraska had been made effective on December 1 by the Governor's proclamation, plans had largely been carried out for the organization of a mutual. These plans were held up a year ago by the referendum on the law. The Employer's Mutual Casualty Company of Nebraska is the name of the new concern and it will start with the advantage of a president who knows the casualty business thoroughly. A. J. Love, of Omaha, one of the best known fire insurance men of the West and head of a big agency which for years has represented the Travelers, is the president. J. W. Grace, the secretary, is also a man of experience in casualty insurance. Among the directors are traction and public utilities magnates, as well as manufacturers and other prominent employers of labor.

* * *

Reorganization of the Kansas City Casualty.—The Kansas City Casualty Company's stockholders will vote on December 29 on a proposition to reduce the capital from $250,000 to $200,000. This will probably be the final step towards putting the company on a substantial basis. When it was organized it undertook to write all casualty and surety lines. After a time it reinsured its boiler and fly-wheel business. When Dennis Hudson became its secretary and general manager he immediately went to work to improve the company's condition. A study of the situation convinced him that it would better discontinue writing employers' liability, workmen's compensation and contract bonds, and these lines were given up in August, 1913. Since then, however, a number of heavy losses have occurred on contracts issued before that time. It was found that to do bonding business the company must issue more powers of attorney than it desired to do and that the expense of handling fiduciary business was so great that it had little likelihood of making money on this class, so it will be discontinued at the end of this year. Notwithstanding that the "heavy" lines were discontinued last year, the company this year has had a premium income of about $110,000, as compared with $129,000 in 1913, the accident and health, plate glass, burglary and automobile business having been largely increased. With a capital of $200,000 the company can be licensed to write these lines in nearly every State. It already has a substantial surplus and with $50,000 added to it from capital, the company can make a statement that will be very satisfactory. It expects to do about $130,000 in premiums next year, and as its expense ratio is low and it is careful in its underwriting it looks for a fair profit on its transactions.

* * *

New Rôle for Moving Pictures in Chicago.—The use of the "movies" to create public sentiment against the liability companies and further the State insurance propaganda has now been adopted in the West. In Chicago, in Iowa and in Minnesota, and probably elsewhere, "For the People" is being shown in the motion picture houses. This is a story of a quarryman who is killed by a blast and his family, being unable to secure damages, goes to the poor farm. Later a boy, a friend of the quarryman's children, now grown to manhood, becomes a State Senator and promises to introduce a workmen's compensation bill that will not require the victims of accidents and their dependents to look to "lawyers and the insurance people." The bill is passed in the Ohio Legislature, notwithstanding intimidation, forgery and attempted bribery to prevent its introduction, and is signed by Governor Cox. It is stated

Detroit to Test Constitutionality of Michigan Act.—Cities in States having compensation laws seem quite inclined to contest the constitutionality of these acts. Recently Cincinnati was defeated in an attempt to knock out the Ohio law on the ground of discrimination in charging cities a flat 1 per cent on their payroll, while private employers' rates are graded according to the hazard. Now Detroit has started suit to prove that the Michigan law is invalid because it requires municipal corporations to come under it, while private employers are given the option of coming under or staying out and losing their main defenses. The action is said to have been decided upon because of pique on the part of the City Water Board at being ordered by the State Industrial Board to pay compensation to an injured employe.

Chicago, December 4, 1914. LA SALLE.

ITEMS OF INSURANCE NEWS.

The New York State Insurance Department has, with admirable wisdom, decided to forbid the declaration of premature dividends by mutual companies writing workmen's compensation in the State and has issued the following letter to all of these companies:

Dear Sirs:—It has come to the attention of this department that some of the mutual compensation companies desire to pay a dividend to their members at the expiration of six months experience. It is our opinion that a mutual company should not declare or pay any dividends to its policyholders until a sufficient period of time has elapsed to give a fairly completed experience.

In accordance therewith you are instructed to withhold declaring or paying any dividend to policyholders until the approval of this department has been obtained, which approval will not be given in any case until one year after the company started writing business and after a departmental examination has been made of the company to ascertain if a dividend is warranted. Respectfully yours,

FRANK HASBROUCK, Superintendent.

The annual meeting of the Association of Life Insurance Counsel will be held in the Library of the Metropolitan Life Insurance Company, No. 1 Madison Avenue, in the City of New York, on Wednesday, December 9, at twelve o'clock noon. Papers will be read as follows: "Misrepresentations as a Defense to Policy Contracts," by James H. McIntosh, Esq., general counsel, New York Life Insurance Company; "Question Arising Under the Non-Forfeiture Statute of Missouri," by Lucius F. Robinson, general counsel, Connecticut Mutual Life Insurance Company and Connecticut General Life Insurance Company; "Must the Policyholder Pay Taxes on the Cash Surrender Value of His Life Insurance?" by Alfred Hurrell, Esq., attorney, Association of Life Insurance Presidents; "A Policyholder's Relation to the Resources of a Mutual Life Insurance Company," by the Hon. William Marshall Bullitt, of Kentucky, former Solicitor-General of the United States.

The Prudential Insurance Company has recently announced a new industrial policy, the benefits of which are payable in weekly instalments instead of in one sum. It is the belief of the company that there is a widespread field of usefulness for an industrial policy providing for the payment of a certain amount each week in order to tide a household over a reasonable period until the members have had a chance to readjust themselves to the change conditions after the breadwinner is gone. By the terms of this new policy the beneficiary receives th insurance in regular weekly instalment for thirteen or twenty-six weeks, as the insured elects at the time of his application. It is not intended that the new offering shall replace the regular industrial policy, payable in one sum, but that it shall be supplementary to it, thus making the protection of the family more complete than has hitherto been possible for industrial policyholders.

Many and divergent opinions are being expressed as to who shall pay the new War Revenue Tax on fire insurance policies which goes into effect this week. As announced in these columns, the National Board of Fire Underwriters has taken the stand that the tax should be passed on by the companies to the policyholders. The Chicago Board of Underwriters has, however, taken the opposite position and on Tuesday, last, adopted the following resolutions:

"Whereas, The act 'to increase the internal revenue, and for other purposes,' was approved on October 22, 1914; and

"Whereas, The language of such act is identical with that of a similar act of June 13, 1898, as regards the affixing of internal revenue stamps to fire insurance policies; and

"Whereas, Under the act of June 13, 1898, the expense of such stamps was borne by fire insurance companies that were engaged in business for profit; and

"Whereas, We believe that said companies are still engaged in the fire insurance business for profit; and

"Whereas, A policy of fire insurance of such companies is not a valid instrument unless the tax thereon is attached thereto; and

"Whereas, To follow the instruction of most of our companies and insist that the assured pay for the stamps necessary to validate the company's policy of fire insurance is fatally uneconomic if not illegal, produces ill feeling between the assured and the insurer, also bad practices in part of the agent and leads to discrimination in rates; and

"Whereas, To put the expense of said stamps on the local agent issuing the policy is equivalent to a still further reduction in the agent's compensation, and at the same time very largely increases the present friction and agitation between the fire insurance company and its local agent; therefore, be it

"Resolved, By the members of the Chicago Board of Underwriters, Incorporated under the laws of the State of Illinois in special meeting assembled, that the cost of such internal revenue stamps as are required under the said law should be borne by the company to whose policies they are attached and which they validate."

It is interesting to find that Minnesota, at least, has provided against "The Case of the Painter Who Fell from a Ladder" (see THE MARKET WORLD AND CHRONICLE, July 25, 1914). In a decision rendered November 13, the Ramsey County District Court, at St. Paul, holds that under the Minnesota Workmen's Compensation Act persons whose employment is only casual cannot seek relief from employers. The case was that of Isadore Fuksman, a house painter, who brought suit against Maurice Rosenbloom for $90. Fuksman was engaged by Rosenbloom, a grocer, to paint his house. While thus engaged he fell from a ladder and was injured.

Judge Kelly declared that the Compensation Act was intended to make the employer an insurer of employes working for him in the conduct of his business.

The Committee on Field Practice of the National Fire Protection Association has completed its two years' work in the compilation of an inspection manual. This publication is called "Field Practice" to distinguish it from the ordinary fire protection handbook, from which it differs radically in function. It is not a mere compilation of fire protection standards, but a handbook designed to educate and serve the man who is undertaking inspection work, and who, possibly, has had very little previous experience. The increasing inspection of premises by uniformed members of the fire departments and by newly constituted municipal inspection bureaus has made such a handbook imperative, covering not only standard equipments, but covering what may be called points of relaxation from the standard which the inexperienced inspector does not know how to look for. This book is designed to point out the common faults in equipments and those points of deterioration difficult for inexperienced persons to discover, with methods and suggestions for their remedy. It is, in its potential usefulness, the most important publication which the National Fire Protection Association has ever compiled.

The Association has published a list of its pamphlets, standards, bulletins, fire reports, etc., which will be sent on application to the Secretary, 87 Milk Street, Boston, Mass.

The Accomplishment of the United States Commission on Industrial Relations

ALMOST exactly a quarter of a century ago (in 1889), that arch-hater of cant in the discussion of economic and social matters, the late Professor William G. Sumner, of Yale University, published in "The Forum," a thoroughly characteristic essay, under the title: "Do We Want Industrial Peace?" The first paragraph of this essay has particular pertinency at the present moment, in view of the matters contained in the first report, submitted to Congress on Monday of this week, of the ambitiously conceived National Commission on Industrial Relations. It is well then to quote Professor Sumner's very words. He wrote:

"It cannot be said that the discussion of the so-called labor question has been productive of any positive results in the way of making us understand the facts and relations of the industrial system any better. The discussion has fallen into certain grooves and has revolved around certain assumptions and pet notions. It has become almost hidden under conventionalities and has bred a series of commonplaces. An actual orthodoxy has arisen in connection with it, dissent from which is regarded with horror. A code of discussion has been elaborated for it and a certain conventional tone of mind has come to be recognized as proper to be assumed before taking part in it. Consequently the future historian will read our labor-bureau literature as a revelation of the mental fashion of our time. There never has been any literature just like it, inasmuch as its chief aim is, while maintaining some of the forms of a scientific investigation, to reach results which shall not brush rudely against the pet notions of any important school of social opinion, or against any one of the strong interests which are in conflict."

The first report to Congress of the Commission on Industrial Relations, mentioned above, covers the year beginning October 22, 1913,—that having been the date upon which the funds appropriated by Congress became available. Another and final report, containing the conclusions and recommendations of the Commission, will be submitted to Congress before August next, in accordance with the terms of the Act creating the Commission. Hence the present report is in the main rather a survey of the work which the Commission has done and of the information it has gathered than a considered interpretation of that information. None the less, the present report reveals clearly enough the method which the Commission has elected to pursue and gives more than a hint of the general character of the recommendations which the final report will contain. In respect of the method pursued, the Commission may be allowed to speak for itself; and the following passage from the report sets out in what manner the Commission has conceived that a sound basis for its final conclusions might be arrived at:

"Our decision to hold public hearings was based on the belief that laws are valueless except where they rest upon a strong opinion, and there seemed no way that would be more effective for ascertaining the general sentiment as to industrial unrest and its causes than the face-to-face method of open hearings to which are summoned interested parties from all walks of life.

"The hearings have served two other great purposes. They

have carried to the general public for the first time, it is believed, an idea of the issues involved in the industrial struggle, and an understanding of the causes which make for industrial unrest. They have compelled both employers and labor to consider deeply their own weakness and shortcomings, and to search for means to correct evils which have been brought to their attention in this public manner."

In pursuance of this programme the Commission has held during the past year a very large number of hearings throughout the country. According to the report no less than 514 witnesses, summoned after careful investigation by agents and members of the Commission, have appeared before it to give their diagnosis of the industrial unrest whose asserted prevalence in the country was the pleaded reason for the creation of the Commission. Of these 514 witnesses, 181 directly represented the point of view of employers of labor; 183 were spokesmen of labor itself; and 150 are described as immediately connected with neither the employing nor the wage-earning class, and were presumably the proponents of all things sociological and humanitarian. Among the witnesses were 29 representatives of organizations of employers, 53 representatives of labor organizations, 30 representatives of private (i. e. so-called civic and similar) organizations, 19 representatives of public institutions and 79 representatives of firms and corporations.

The programme is certainly an impressive one, and the obvious laboriousness of carrying it out, involving great sacrifices on the part of the members of the Commission, makes it appear reactionary and almost cynical to ask whether it is open to the biting criticism of Professor Sumner that "its chief aim is, while maintaining some of the forms of a scientific investigation, to reach results which shall not brush rudely against the pet notions of any important school of social opinion or against any one of the strong interests which are in conflict." At first sight there would seem to be a broad basis for induction in the testimony of 514 persons,—all vitally concerned with the problem of the relationship between capital and labor,—with regard to the causes of the antagonisms and strifes that are continually in evidence between the two interests. If industrial peace and concord are desiderata and if these can be attained through the results of any scientific inquiry, what more trustworthy course of inquiry could be followed than to gather at first hand and collate the contentions of all the parties and then to strike a just mean of these contentions? In this way, too, if in any, it may very plausibly be alleged, it should be possible, in the words of the Commission, "to carry to the general public * * * an idea of the issues involved in the industrial struggle, and an understanding of the causes which make for industrial unrest."

At any rate the Commission has conceived that its function can best be fulfilled through the employment of this method; and in the present report, though it reserves its ultimate conclusions for its final report, it presents as solidly established "the causes which make for industrial unrest" in the United States. These it enumerates, not, to be sure, with its own direct assertion of their exclusive validity, but as being so generally accepted that their validity may be taken for granted henceforth in any discussion of the matter. The list of causes, with their proponents, is as follows:

"A world-wide movement arising from a desire for better living conditions.—Advanced by representatives of labor, Socialists and employers, and generally endorsed.

"A protest against low wages, long hours, and improper working conditions in many industries.—Advanced by practically all labor representatives, and assented to by many employers.

"A desire on the part of the workers for a voice in the determination of conditions under which they labor, and a revolt against arbitrary treatment of individual workers and a suppression of organization.—Almost uniformly approved by labor witnesses.

"Unemployment and the insecurity of employment.—Generally advanced.

"Unjust distribution of the products of industry.—Advanced by most labor representatives and agreed to by most employers.

"Misunderstanding and prejudice.—Agreed to by employers and employes.

"Agitation and agitators.—Advanced by employers; defended by labor representatives and others as a necessary means of education.

"The rapid rise in prices, as compared with wages.

"The rapidly growing feeling that redress for injuries and oppression cannot be secured through existing institutions."

These are the nine generally agreed-upon prime causes of our industrial unrest, which it is assumed to be the province of legislation and of governmental activity to mitigate, if not to do away with altogether. The report suggests also a subsidiary cause. "In addition," it says, "it has been stated by many witnesses that the tremendous immigration of the last quarter century, while not itself a direct cause of unrest, has served to accentuate the conditions arising from other causes, by creating an over-supply of labor unfamiliar with American customs, language and conditions."

Having thus, with all the appearance of a wide collection of the available material, established the causes of the evils which it was created to elucidate and propose remedies for, the Commission announces that in its final report, a few months hence, its constructive programme will appear. Hints of what this programme will contain may be found in the present report; but it is scarcely worth while to dwell upon them in their tentative form. The main point now is that the Commission promises to submit to Congress, as the true fruit of its labors, positive proposals for constructive legislation in this important field. And the list of the matters to be covered by these proposals for legislation is given,—a very formidable list. In it we find: labor exchanges; industrial education, vocational guidance and apprenticeship; sanitation, health of employes and administration of laws relating thereto; smuggling of Asiatics; mediation, conciliation and arbitration; woman and child labor, minimum wage, hours of labor; agriculture and farm labor; social insurance, especially workmen's sickness and invalidity insurance; and, finally, labor and the law.

All the familiar words and phrases,—we were almost tempted to say, all the familiar panaceas,—are in this list. If all the matters mentioned in it were to be covered by National legislation, it may easily be imagined what a bewildering mass of statutes we should have, relating to the conduct of industry in the United States. The perplexities of the Sherman Act, combined with those of the new anti-trust statutes which provide "the road at last both clear and firm to business," would be trivial in comparison with the

maze of restrictions and uncertainties through which business,—and by business we mean both employers and employed,—would have to proceed, if so-called "constructive legislation" were to be enacted by Congress with respect to all these multitudinous aspects of the problem of making the conditions of our industrial life conform out-of-hand to the ideals of a perfected and care-free human society. It is, of course, highly improbable that Congress will attempt any such task; it has to give some heed to the Constitutional limitations upon its activities, as well as to the possibility of economic disturbances whose effects will be visited upon the heads of its members, however well-intentioned their action may have been. It is, however, to be expected that, following upon the suggestions of the Commission on Industrial Relations,—supposing these to be what are portended,—we shall have all manner of projects of legislation introduced in the National Legislature, and no little eager and perhaps acrimonious discussion about them. Hence it is no bad time for the sober-thinking to be quietly pondering fundamental principles and preparing themselves for the coming agitation.

It is apparent at a glance that the nine agreed-upon causes of our industrial unrest enumerated by the Commission belong preponderantly to the realm of feeling and emotion rather than to that of economic necessity. In fact, the Commission's entire first report contains hardly a hint that there is any such thing as economic necessity or that any consideration needs to be given to it. From reading the report one would hardly suspect at all that the one profound cause of industrial and social unrest in this and all civilized countries is the impatience of the majority of mankind with the stern fact that, with insignificant exceptions, all of us must accommodate the manner of our living to what we are able to produce. We get what we give,—no more and no less, in the long run. And in the long run, too, we must submit to the full play of the great economic forces, whether they are comfortable for us or not. There exist no human means, for instance, of staying a general migration from agricultural to industrial occupations, if the remuneration and conditions of the latter are more appealing than those of the former. The industrial unrest produced in those previously engaged in the industrial occupations, whether through more intense competition of workers or through an enhanced cost of food, cannot be prevented by any form of legislation. No more can legislation prevent the unrest of workers, and of employers also, in those industries which for any reason are waning, or whose production has grown to exceed the requirements of the rest of the population. Again, the legislature is impotent in the face of a world-wide imperative need for capital. This condition brings with it inevitably that higher return to capital which is the only means of inducing its more rapid and abundant accumulation. All the considerations of so-called social justice must yield to this over-riding need; and all discussion about the "unjust distribution of the products of industry" becomes irrelevant. Legislation to procure a "just" distribution is, under such circumstances, the most grievous of social harms.

It were foolish to deny that there is large opportunity for the study of unnecessary abuses, from which workers unjustly suffer, in modern industry. A wholesome state of the body politic requires that these should be studied and that they should be treated as proper subjects for police regulation, pure and simple. But to hope and believe that such police regulation will do away with industrial unrest is the height of unwisdom. For the fact is that no forward-looking American should desire to have an end put to industrial unrest. It is a condition precedent to our social life and health. No one has said this better than Professor Sumner, in the essay to which reference has been made. A paragraph from that essay may well conclude this discussion. It is as follows:

"The same is true with regard to industrial war. It is worth all that it costs to maintain industrial liberty. So far as individual interests are concerned, those who find themselves weak under liberty may be sure that they would find themselves very much weaker under any system of legal regulation. That, however, is a comparatively unimportant consideration. The most important consideration is that the industrial war is solving questions which can never be solved in any other way."

Arthur Richmond Marsh

THE UNDERLYING CAUSE OF BRITISH COMMERCIAL SUCCESS IN SOUTH AMERICA

By Charles L. Chandler*

South American Agent, Southern Railway, Mobile and Ohio Railway, etc. Formerly of the United State Consular Service

IN a previous article allusion was made to the fact that South America buys five times more from Europe than from the United States, and that before the present European War England and Germany were the nations contributing most of these European purchases. During the last three months a flood of well-meant, but erroneous advice has spread over this country, to the effect that England's commercial supremacy in South America is ours for the asking—that it is lying ready to be picked like a ripe apple, to use M. Jules Huret's phrase when warning his countrymen against too ready success in South American trade. England's commercial supremacy in South America, more particularly in the temperate countries of settlement of that continent, is on a very sure and sound foundation—the surest and soundest of all foundations, namely, her large investments there. These investments have contributed more than anything else to her trade supremacy. She controls 73 per cent of the 25,000 miles of Argentine railways; no wonder that in some years not a single American locomotive is exported to Argentina, and very little other American rolling stock. John Bull understands co-operative foreign marketing. For instance, he is a director in a locomotive factory in his home city of Nottingham. He is a director in a shipping company that carries the locomotive from Liverpool to Buenos Aires. In London he has a bank account with the London and River Plate Bank. The Bank has had an agency in Buenos Aires since 1863. There is a Spanish proverb which says that money works more than it talks. There are $1,605,383,573 of John Bull's money invested in Argentina—and it has yielded from thirty-fold to ninety-fold on the investment. The banks investing declare dividends of from 12 to 20 per cent; the railway directors sit in Leadenhall Street, London, and cut off many and many a coupon which is not thought of by the average student of trade conditions as being a part of the fundamental basis upon which British trade rests.

*This is the second of a series of articles on South American trade conditions which Mr. Chandler is contributing to this paper. The first article, "The Personal Element in Our Trade with South America," appeared in our issue of November 7.—Editor.

But the British money is not all in railways in Argentina. $384,297,606 is in government bonds, and through them in waterworks and public utilities. Why is so much iron pipe brought to Argentina from Sheffield? Because London bankers have floated the bonds of the flourishing new city of Villa Magnificencia; and if the English bankers have shown enough faith, hope and charity to take up the bonds, why shouldn't they deliver the articles for which those bonds will pay? Can the citizens of our sister republic float those bonds in the United States? How many Argentine securities are listed on the New York Stock Exchange? How many members of the Stock Exchange know that Buenos Aires has a white population of 1,548,664, or practically as great as that of Philadelphia?

A pastoral country needs money to buy blooded stock. The best horses in Argentina are bought in England; $193,000 was paid for a Derby winner recently. Money is needed to finance the large ranches, and the new packing and freezing plants; that is where much of that $239,374,880 of British money that is invested in "miscellaneous investments" in Argentina goes.

How much United States money is invested in Argentina? What have we actually contributed to the development of our sister republic? Is United States capital financing any railways there now? We have about $20,000,000 invested there as a maximum estimate, as compared with over $1,600,000,000 of English capital. Obviously a new country of settlement must have money for its development. It is no secret that we ourselves needed it badly enough when we were nationally growing and internally developing. Therefore we should not be surprised that Argentina buys twice as much from England as from the United States, when England has invested in her development over one hundred times more than has the United States. In fact, we should rather wonder that our proportion is as great as it is. There are barely five thousand citizens of the United States in Argentina, while there are fifty-four thousand British subjects. There is more British money invested in the development of the city of Bahia Blanca, the population of which is seventy thousand—all white—than in any other city in the world not under the British flag. Incidentally, there are two direct steamship lines under the American flag between Bahia Blanca and New York, but our Government maintains there no consular representation of any kind.

There is not a single South American country where British investments do not exceed those of the United States, with the possible exception of Ecuador, where our enterprise and capital have opened a railroad which has been the greatest single permanent factor in that rich republic's recent development. Even in Peru, where there is more United States money invested than we have at the present moment in Japan and China put together, England has investments twice as large as those of the United States—$125,449,527, as compared with our $60,000,000. Growing countries such as these, built up by foreign capital, "financial protectorates," as they may be called, are wholly characteristic of modern imperialism. Chile has not quite 4,500,000 people. England has $302,382,224 invested in Chile about $60 per inhabitant. No wonder that our ablest diplomats could not get Chile to buy her warships in the United States, in spite of the fact that her first foreign officers and ships were from Baltimore and Connecticut, long before Cochrane came to Chile in 1817. We cannot help remarking in passing that British investments in Mexico amounted to $763,693,832 just before the Diaz regime closed.

We have spoken of individual countries, and have given a few general figures. That investments of English capital in South America were increasing before the war would seem to be indicated by the London Stock Exchange estimate of $3,964,833,229 on December 31, 1911, and $4,560,594,979 on December 31, 1912—a gain of $596,121,750. This gain in a single year is at least five times greater than the entire investment of United States money in South America.

At times we may guage a government's interest in foreign countries by what it has invested in its consular services therein. Germany has doubled her consular expenditures in South America since 1907; England has increased hers by over one-half, and we have added barely $30,000 to our own, as was brought out by Congressman Cyrus Cline in his instructive speech of May 14 last, in the House of Representatives.

What is the conclusion? It obviously must be that trade follows the loan; and that it even more surely follows the investment.

We can by native skill and industry partially overcome this tremendous handicap; but it is always there and must be reckoned with, and never more forcibly than at this present moment.

The South American countries are not bankrupt to-day. They are no more bankrupt than a man whose house has burnt down but whose farm is intact and laden with crops. Argentina will profit by the European war almost as much as will the United States, as far as the sales of raw products are concerned; she has already shipped live stock and grain to the armies; and she is better situated than most of her fellow republics. But to develop trade with Europe or with the United States, the primary need of all South American countries, as Consul Manning, of Barranquilla, has so well stated, is not catalogues but credit; not samples but securites. To try to sell them goods and give them nothing to replace their destroyed credit arrangements with Europe is like putting tempting dishes before an armless man. They have just as much to offer as security as have many of the temporarily embarrassed communities in our own country. In fact, they have the most valuable vegetable products in the world to pledge; they have tin, if we would only lend them the money to smelt it; gold and copper, if we would only lend them the money to mine it. We can ascertain just as much about the desirability of such investments as if they were in the United States. Our leading credit agencies have correspondents in all important South American cities, and the National City Bank's new service supplements this. England derives $70,000,000 a year from her investments in Argentine railways alone. The continent is only beginning to be developed. Can we not employ our surplus capital in this development? Until we do, we shall never have our share of South American trade.

NEW YORK CLEARING HOUSE LOAN CERTIFICATES IN 1914

THE cancellation, on Saturday, November 28, of the last outstanding clearing house loan certificates of the banks of the New York Clearing House, in effect marks, it is hoped and expected, the end of an interesting and important chapter in American banking. Not quite all the clearing house loan certificates issued in other cities in the country during the past four months have been retired as yet; but the importance of New York as the chief centre of American banking makes the action of the New York banks decisive for the banks of all other cities. In no long time, no remnant will remain of the 1914 issues of these certificates. And in the future, if the Federal Reserve System performs the function for which it has been created, there will not again be had recourse by the banks to this expedient for meeting the more or less frequent excessive strains and the occasional panics which have characterized our banking and credit mechanism. Bankers will be the last to regret that they must say goodbye to this peculiarly American device, though they must, of course,

concede that in default of something better it has more than once served us well.

The present year's issues of clearing house loan certficiates naturally were due to the sudden cramp of domestic and foreign exchanges, and the tie-up of money, brought on by the European War. It is scarcely a secret that the clearing house banks of New York, even under the trying conditions of early August, resorted to them with reluctance, and in no small measure at first at the solicitation of the Treasury Department of the United States, although it is virtually certain that the defense of our stock of gold would have made the use of them unavoidable in any case. In the same way, Aldrich-Vreeland emergency currency notes were taken out by the banks in larger volume than perhaps a majority of the New York and other Northern and Eastern bankers really thought necessary or advantageous, because the authorities at Washington were exceedingly solicitous to increase the available currency with all speed, while they were not ready to put the Federal Reserve System into operation at once. Hereafter, on the other hand, it is expected that resort to the Federal Reserve Banks will produce such ready relief for any monetary crisis that there can be no possible interruption of regular clearings, anywhere in the country, by reason of a scarcity of the circulating medium, however produced. At the end of this article is reprinted an interesting table compiled by the "Journal of Commerce" giving a detailed record of the use of loan certificates of the New York Clearing House from the first issue in 1860 up to and including the issue of 1914.

In view of the finality of the present cancellation of clearing house loan certificates in New York, there is much interest in a statement given out this week by Mr. Albert H. Wiggin, Chairman of the Clearing House Committee, which covers summarily the use made of the certificates from the date of the first issue of them,—August 3, 1914,—to the date of the cancellation of the last of them,—November 28, 1914. According to Mr. Wiggin's statement, the total number of days during which there were certificates outstanding was 118; but the last issue of them was made on October 15, only 73 days after the first issue. The aggregate amount of the certificates issued altogether was $124,695,000; but the largest amount outstanding at any one time was $109,185,000, while the largest amount in circulation at any one time was $57,625,000. The character of the collateral deposited from first to last as security for the certificates is shown by the following table:

COLLATERAL DEPOSITED FOR LOAN CERTIFICATES.

Commercial paper	$234,465,000	50.7%
Bonds and securities	163,873,000	35.5%
Collateral loans	63,836,000	13.8%
Total	$462,174,000	100.0%

The maximum amount of collateral in the hands of the Clearing House Committee at any one time, as security for clearing house loan certificates issued, was $158,327,000.

LOAN CERTIFICATES OF THE NEW YORK CLEARING HOUSE.

Loan Comm. of	Date of First Issue.	Date of Last Issue.	Date of First Cancellation.	Date of Final Cancellation.	Aggregate Issue.	Max. Am't Outstanding.	Date of Max. Outstanding.	Rate of Interest.	Nature of Collateral.
1860	Nov. 23, 1860	Feb. 27, 1861	Dec. 12, 1860	Mar. 9, 1861	$7,375,000	$6,860,000	Dec. 22, 1860	7 p. c.	U. S. stocks; Treasury notes; stocks of State of New York.
1861	Sept. 19, 1861	Feb. 17, 1862	Oct. 7, 1861	April 18, 1862	22,585,000	21,960,000	Feb. 7, 1862	6 p. c.	Temporary receipts of United States for purchase of Government bonds.
1863	Nov. 6, 1863	Jan. 9, 1864	....	Feb. 1, 1864	11,471,000	9,608,000	Nov. 27 to Dec. 1, 1863	6 p. c.	U. S. or N. Y. State stocks, bonds, etc., or temporary receipts as in 1861.
1864	March 7, 1864	April 25, 1864	April 20, 1864	June 13, 1864	17,728,000	16,418,000	Apr. 20, 1864	6 p. c.	Same as in 1863; comm. of that year continued.

1884*	May 15, 1884	June 6, 1884	May 19, 1884	Sept. 23, 1886	24,915,000	21,885,000	May 24, 1884	6 p. c.	Ditto.
1890	Nov. 12, 1890	Dec. 22, 1890	Nov. 28, 1890	Feb. 7, 1891	16,645,000	15,205,000	Dec. 12, 1890	6 p. c.	Ditto.
1893	June 21, 1893	Sept. 6, 1893	July 6, 1893	Nov. 1, 1893	41,490,000	38,280,000	Aug. 20 to Sept. 6, 1893	6 p. c.	Ditto.
1907	Oct. 26, 1907	Jan. 30, 1908	Nov. 14, 1907	Mar. 28, 1908	101,060,000	88,420,000	Dec. 16, 1907	6 p. c.	Ditto.
1914	Aug. 3, 1914	Oct. 15, 1914	Aug. 26, 1914	Nov. 28, 1914	124,695,000	109,185,000	....	6 p. c.	Ditto.

*The certificates of all the banks, except part of those issued to the Metropolitan National Bank, were cancelled by September 1, 1884, and these were gradually retired as the bills receivable became due and were paid.

BRITISH AND AMERICAN TRADE AFTER THREE MONTHS OF WAR

THE proverbial visitor from Mars could hardly fail to be considerably surprised if he were to examine the comparative figures covering the foreign commerce of Great Britain and the United States during October, 1914. The simple facts of the matter appear to be these: On the one hand a nation of less than 50 million people, living on two islands about 120 thousand square miles in area, and engaged, during the period covered by the trade figures referred to, in the third month of a critical and tremendously expensive war; on the other hand, a nation of 100 million people, inhabiting a continental area of 3½ million square miles, or nearly 30 times as great as that of the smaller country, and, almost alone of the great nations, entirely at peace.

Despite these unequal conditions, the United Kingdom imported during the month of October, 1914, merchandise valued at $258,000,000, as against imports into the United States of $138,000,000. This was a falling off from the figure for the corresponding month in 1913 of 28 per cent in the cast of British imports; but it was an actual increase of 5 per cent in United States imports as compared with the returns for October, 1913. In a sense, however, the British advantage in the matter of imports is to be expected. Even in normal times a country of high civilization, with a population of 376 to the square mile, would be expected to import a large per capita average of merchandise, while a nation of the same grade of advancement with a population distributed over a vast and rich territory on an average of only 27 per square mile would normally require a much smaller ratio of imports. And such is the fact. The per capita imports of Great Britain in 1913 amounted to $79, and those of the United States to $18. Obviously in time of war, when the output of native industries is to a considerable extent reduced, the import requirements of a country are increased.

It is more surprising, however, to find that British exports

declined only 36 per cent in value, as against the 28 per cent decline in value of imports. The exports from the United States declined 28 per cent in value for the month, amounting to $195,000,000, as against a total value of $179,000,000 exported from the United Kingdom. This result can hardly be considered as other than a distinct achievement. There is perhaps a pardonable note of pride in an article on British trade for October in a recent issue of the London "Economist." The passage is as follows:

"Under the abnormal conditions now prevalent, when a belligerent country lives, so to speak, from hand to mouth from month to month, it is quite permissible to be content with the actual increase in October. Moreover, when all the obstacles to progress are taken into account—the complete disappearance of commerce with Germany and Austria-Hungary, the dislocation of the world's exchanges, the destruction on the Continent, the closing of the Baltic and Black Sea routes to Russia, the dangers of the North Sea (the most important shipping area in the world), and the diversion of men into the army—it is a matter for no small congratulation that we maintain 72 per cent of our import, 64 per cent of our export, and 75 per cent of our re-export trade. That we have achieved such success is due to three great assets that we possess—our insular position, our naval supremacy, and the predominance of our mercantile marine."

One of the most positive conclusions which may be drawn from the strength Great Britain has shown in maintaining her trade position under severe handicaps must be that the early prophecies of the shifting of commercial predominance to the United States as a result of the European war are at least premature. It has been pointed out in these pages several times since the present war broke out that the United States had not entered the modern arena of foreign trade on the same basis as that upon which England and Germany had done so. To them, foreign trade was a necessary element of existence, both from an import and an export point of view. As has been stated in an earlier article, the total annual output of manufactured goods in the United States is valued at approximately 25 billion dollars, a value in excess of the total manufactured products of England, Germany, France, Belgium and Holland combined. Yet the United States uses within its own boundaries 96.5 per cent of its product, while the five nations mentioned consume less than 40 per cent of their own manufactures. It must be clear from this that the export trade, or at any rate this important branch thereof, is a far less vital matter to the United States than it is to the other commercial nations. It is not improbable that, as an accompaniment of the fuller internal growth and development of this country, a greater export surplus will be accumulated from year to year. If this result is achieved it is also probable that the necessary financial assistance will be rendered to our foreign customers in the newer countries which will bind them to us on a basis of sound co-operation. When this is done it will be possible to make a juster comparison of the trade achievement of the United States and that of Great Britain. In the meantime, without detracting from the truly great success of the United Kingdom, it is well to bear constantly in mind that as between the two countries, the United States is a borrowing nation and Great Britain a lending nation. The vast financial requirements of this country for the development of its industrial and natural resources put it on a wholly different plane, with regard to the ultimate ranking of its trade position, than that occupied by a small, highly developed country such as Great Britain with capital invested abroad to the amount of over 15 billion dollars, as estimated by Sir George Paish, and with the consequent substantial annual income to offset such excess of imports over exports of merchandise as may be convenient to meet the country's annual needs.

At the same time, while it is of first importance to a clear understanding of the relative trade positions of the two countries to appreciate the economic differences which underlie their status, it is none the less true that each is the chief customer of the other; and the fluctuations in the purchasing or producing capacity of either country is of immediate interest in the other. It is of value, therefore, to examine the main features of the foreign trade of Great Britain and of the United States for October, 1914, as compared with the results in October, 1913.

The total figures for the month have already been set out. British imports naturally consist chiefly of foodstuffs, although the lagest single import item in the course of a year is raw cotton. During October, 1914, roughly £28,000,000 in value of imports represented foodstuffs, £14,000,000 raw materials, and £10,000,000 manufactured articles. The value of food-stuffs was slightly in excess of the value for October, 1913; the value of raw materials was only 50 per cent of the 1913 value, owing chiefly to a decline in cotton imports for the month of over £7,000,000, in oils and gums of nearly £2,000,000, and in wood and timber of £1,000,000. There was, also, a greater or less decline in every important item on the raw material list, including ore, wool, and hides. Under manufactured articles, the largest decline appeared under the head of iron and steel, which showed a falling off of over £1,000,000, or 75 per cent. This, of course, is due to the total elimination of the German trade. Under the head of manufactured articles, as in the case of raw materials other than food-stuffs, a loss is registered in every item of importance.

With regard to exports, a loss is reported under every item in the usual monthly summary issued as a supplement to the London "Economist." Manufactured goods form the chief item of British export trade, and under this classification the chief actual loss is naturally to be found. Under exports of manufactured goods there was a decline for the month to the value of £13,000,000, or 37 per cent. Exports of foodstuffs declined £1,000,000, or 32 per cent, and exports of raw materials £2,700,000, or 42 per cent, £2,200,000 of this last amount being under the head of coal and coke. Of the decrease in the value of British exports for the month of £18,000,000, over £13,000,000 was represented by losses in various forms of manufactured goods exported. This feature of the returns is therefore of sufficient importance to be recorded in detail. The following table is taken from the "Economist":

EXPORTS OF BRITISH MANUFACTURES.

	Oct. 1913.	Oct. 1914.	Inc. or Dec. in Oct. 1914.
Iron and steel, manufactures thereof..	£4,672,588	£2,810,817	—£1,861,771
Other metals, manufactures thereof....	1,155,573	807,717	— 347,856
Machinery	3,271,296	2,032,738	— 1,238,558
Cotton manufactures	11,374,113	6,109,580	— 5,264,533
Wool manufactures	2,739,879	1,455,233	— 1,284,656
Apparel	1,389,714	984,790	— 404,924
Chemicals, drugs, dyes and colors.....	1,828,969	1,570,270	— 258,762
Railway carriages, etc	1,032,514	828,121	— 254,393
Miscellaneous	3,183,613	2,297,804	— 885,809

As to future possibilities, the "Economist" has little to say. A note of discouragement, however, is found in the fact that the percentages of monthly trade decline, as compared with the corresponding months of 1913, are less favorable for the month under consideration than for the first two months of war. In other words, the decrease in British imports in August, 1914, as compared with August, 1913, was 24 per cent; the decrease in September, 1914, as compared with the corresponding month in 1913, was 26 per cent, and the decrease in October, 1914, as compared with October, 1913, was 28 per cent. With regard to exports, the August decrease was relatively the greatest, but the October decline was greater than that in September. August, 1914, exports fell off 45 per cent from the 1913 figures; September exports

fell off 37 per cent, and October exports 38 per cent. For the ten months ending October 31, 1914, all the classes of British imports and exports referred to above show a substantial decline as compared with 1913 figures.

As has been pointed out, the total value of imports into the United States in October, 1914, was 5 per cent greater than the value for October, 1913. Imports for the ten months ending October 31, 1914, exceeded in value the imports for any similar period in the history of the country. In fact, the import value for the first ten months of this year, namely, $1,548,531,394, is greater than the import value for the total fiscal year 1911, which amounted to $1,527,226,105. Imports of food-stuffs in October, 1914, increased approximately $4,000,000, imports of crude material increased $4,000,000, while manufactured goods imported declined about $3,000,000, making a net increase for these items of $5,000,000.

The net decline in the value of our exports for October, 1914, was $76,000,000. There was a decrease in the value of crude material exports of $90,000,000, and a decrease in manufactured goods exported of $19,000,000, making a total decrease of $109,000,000 under both heads. There was an export increase for the month of $33,000,000 in value of food-stuffs, making the net total decrease of $76,000,000 in exports for the month.

With regard to specific countries, it is interesting to note that no new fields for our exports have been developed as a result of the war. The only increases which appear in the returns for the month are under exports to Great Britain, Russia, Italy, and Cuba, totaling less than $5,000,000 in all. Decreases have been shown in our much heralded Oriental trade amounting to $3,000,000 in the case of Japan and $1,000,000 in the case of China. The even more fully advertised possibilities in South America have yet to be taken advantage of. Our Argentine exports for the month, as compared with October, 1913, declined from $5,168,000 to $1,684,000, while exports to Brazil for the same month fell from $3,866,000 to $1,362,000. The total loss for the month in the case of these two countries alone was more than $1,000,000 in excess of the amount gained in exports to all other countries combined. It is hardly necessary to add to the evidence of these figures in bringing out forcibly the truth of the suggestion made in an earlier paragraph, namely, that trade cannot be built up in a moment, but must be founded on a painstaking study of conditions, combined with substantial financial aid to the countries with which commercial intercourse is desired.

GERMANY'S FOOD SUPPLY AND ITS SUFFICIENCY FOR WAR TIME

A CORRESPONDENT of the United Press, Mr. Karl H. von Wiegand, has recently interviewed the German Minister of Agriculture, Baron von Schoriemer, upon the subject of the present and prospective sufficiency of Germany's food supply, while the war is going on and assuming that Germany will continue to be in the main cut off from any considerable imports of foodstuffs from foreign countries. Mr. von Wiegand's account of the interview, in the form of a letter from Berlin under date of November 10, has been published in the New York "Evening Sun," of December 5. The most striking feature of the interview is that its theme is one that has never before in the memory of living persons required consideration. This theme is whether one of the great nations of the world will or will not be able to make both ends meet in the matter of food for its population. From this point of view the interview is exceedingly interesting; and the statistical information contained in it cannot help stirring reflection upon the basic economic situation of any and all modern countries in which industrial development and its accompanying "urbanism" have brought about a disproportion in numbers between the food producers and the industrial wage-earners.

As was to be expected, Baron von Schoriemer stoutly denied the possibility that Germany might be reduced to submission by the Allies, through lack of food. At the same time, his figures show at the best the closest kind of margin and clearly indicate that the striking of a balance between supply and demand can be accomplished only by the most strenuous economy, nearly approaching actual deprivation. Moreover, he appears not to have taken into his calculation the diminution in the agricultural production of Germany for the coming years, due to the withdrawal for military service of certainly 3,000,000 and quite possibly 4,000,000 farmers and farm laborers, whose normal production can scarcely be expected to be made good by the labor of women, children and the aged, because these classes of farm workers have hitherto contributed to agriculture virtually all of which they are capable. Something, of course, may be accomplished by the diversion of labor from the cities and idle industrial centres to the farms; but this labor must be comparatively ineffective, at least during its first season at the new work.

It is well, however, to state the substance of what Baron von Schoriemer said to his interviewer. "In the first place," explained the Minister, "we have 3,000,000 less mouths to feed now than in times of peace. These figures represent foreigners who have left Germany and our soldiers who are subsisting off the enemy's territory. They represent a saving of approximately 1,000,000 tons of grain and 2,000,000 tons of potatoes. Add to this the great saving and elimination of waste by the people because of the war." A reduction of 3,000,000 in the number of mouths to be fed, leaves the German population for which food must be provided at approximately 66,000,000 persons. The annual food requirements, other than meat and other animal products, for this population the Minister estimated to be 15,760,000 tons of grains for bread and 43,296,000 tons of potatoes.

As against this demand, Baron von Schoriemer spoke as follows of the potential supply of grains and potatoes, resulting from the German agricultural production of 1914: "Our crop last year," he said, "exclusive of the seed, was: Grains, 14,651,000 tons; potatoes, 48,662,000 tons. This left 1,109,000 tons of grains to be imported and a surplus of 5,366,000 tons of potatoes. We exported 581,921 tons of rye, but imported 2,007,610 tons of wheat. Exportation of foodstuffs is prohibited and, therefore, the surplus rye and potato production will go a long way toward filling up the lack between production and consumption of wheat usually covered by imports. The use of grain for feeding animals or for industrial purposes has been forbidden. There is to be a small percentage of rye flour used in making wheat bread and not less than 5 per cent of potato flour in rye bread. Many use 10 per cent. Two hundred factories are being established for the manufacture of potato flour. There were 300,000 tons of grain left from last year's crops. One million tons of grains will be saved through prohibition of feeding it to animals. The mixture of rye with wheat and of potato flour with rye to make bread means a vast addition to the bread supply."

This is certainly very close calculation; and, as suggested above, it makes no allowance for the diminished production which must result from the withdrawal of farm workers to serve in the army. On the side of meat and other animal products, however, the showing made out by Baron von Schoriemer would appear to be even less satisfactory. To be sure, he lays stress upon the gratifying number of farm animals in Germany, saying of it: "Our 'animal cen-

sus' shows gratifying figures. Less than a year ago there were 20,994,844 head of cattle, 5,520,837 head of sheep, 25,669,140 hogs and 3,548,384 goats. There were 3,226,640 horses in Prussia alone at that time. Before this supply is gone we will get no slight amount more through importation, despite present unsatisfactory conditions along this line." Here again, however, no allowance is made for the necessary reduction in the production of milk, butter, veal and pork, by reason of the curtailment of the amount of grain available for feeding purposes. It has to be remembered, too, that Germany's meat and dairy production has of late years been very greatly stimulated by means of large importations of cattle foods and fodders from foreign countries. Hence, not only the domestic grains but also the imported fodders and foods will be withdrawn from animal production, certainly with severe effects upon the amount of the products.

But even with this normal supply of meat and dairy animals, Germany has not hitherto been sufficient unto herself in this class of foodstuffs. According to Baron von Schoriemer, Germany produces only 108 pounds of the 116 pounds of meat consumed per capita. The deficiency of the domestic production is especially marked in respect of poultry. Fowls, and geese in particular, may be expected to become very scarce, as most of the supply has been coming from Russia. "Over 7,000,000 tons of geese of the 8,568,872 tons Germany imported last year, came from Russia; one-third of the 12,683 tons of chickens we imported came from Russia."

Eggs, too, are likely to be in greatly diminished supply: "We shall have to go without approximately 166,286 tons of eggs which we imported last year, and we shall have to replace coffee, tea and cocoa with something else. We produce more sugar than we use. Wool and rubber supplies may run low and become scarce, even. Private individuals cannot now purchase automobiles or tires."

It seems apparent from the figures and prognostications of the German Minister of Agriculture himself that the food problem which Germany will have to face, after the supplies derived from the period before the war are consumed, will be scarcely less serious than her military problem. Indeed, the figures contain all the internal indications of the severest privations for the German people.

ECONOMIC NOTES

Traffic Through the Panama Canal.—The "Canal Record" gives the following account of the traffic through the Panama Canal during the first two months of its being open for passage:

"During the period of two months, from August 15 to October 15, that the Panama Canal has been open to traffic, the commercial vessels which have been using it have carried through 583,949 tons of cargo. The traffic has followed fairly well defined trade routes, and the course of the great majority of vessels may be roughly classed in four great groups.

"The heaviest traffic has been between the Atlantic and Pacific coasts of the United States. Manufactured goods of great variety and general merchandise are carried from the Atlantic seaboard, principally from New York, and secondarily from Boston, Philadelphia and New Orleans, to the principal California and Puget Sound ports; also to Honolulu. On the Eastbound voyage, these vessels carry chiefly canned fruits, vegetables and salmon, lumber, grain, sugar, pineapples and wine. This trade is restricted to vessels of American registry, and nearly all the American vessels which have used the canal have been engaged in it. During the period of canal operation, 24 vessels have passed through Eastbound on this route with 151,290 tons, and 25 Westbound with 135,214 tons. These passages, 49 in all, have constituted approximately 44 per cent of all the 113 passages through the canal. The total cargo carried on this route, 286,504 tons, has been almost exactly 50 per cent of all cargo.

"A route between the Eastern coast of the United States and the west coast of South America has been second in cargo through the canal. Northbound vessels carry principally nitrates from the fields of Chile, with secondary cargo of raw material products of the Western countries of South America, and Southbound vessels carry manufactured goods from the United States and Europe. The Northbound traffic, passing 13 vessels with 93,139 tons through the canal during the two month period, has considerably exceeded the Southbound, consisting of three vessels with 18,800 tons, and one in ballast, though the Southbound traffic seems to be getting under way.

"There has been a marked, though probably seasonal, traffic from the Pacific ports of the United States and Southwest Canada to Europe with grain. Ten vessels, each heavily laden, have gone through Eastbound, with 71,560 tons, and eight vessels, all of foreign registry, have gone from the Atlantic to the Pacific in ballast, to return on this route with grain. In addition, one vessel, which went through the canal with 6,000 tons of manufactured goods, from Antwerp to Tacoma, is to return with grain.

"The fourth great route has been from the Atlantic seaboard of the United States to China and Japan, with refined petroleum in bulk and in cases, and other petroleum products. Four vessels have gone through in this trade from the Gulf of Mexico, with 24,931 tons, and four from Philadelphia and New York, with 26,570 tons, an aggregate of 51,501 tons. No vessels have gone in the other direction on this route.

"Next to the four principal routes just described, the most notable development has been the coal traffic from the middle Atlantic seaboard of the United States to the Pacific coast of North and South America. Five vessels, four from Norfolk, with 22,535 tons, and one from Baltimore, with 6,000 tons, have carried coal to the upper Pacific, and one vessel from Baltimore has carried 6,010 tons to Valparaiso. The total coal carried has been 34,545 tons. None of these vessels have returned through the canal to this time, but it is understood that they will load with Pacific coast products for the Eastern United States and for Europe.

"The development of a line from Liverpool around South America, with vessels sailing both ways, via the canal, has been arrested by the European war. The only vessels to have used the canal in this route was the steamship Potosi, which passed through the canal on September 25, on its way South, along the West coast of South America. It was held in the bay at Balboa, awaiting orders, but sailed on October 14.

"The steamship Desabla, which passed through the canal on October 12, in ballast, was on its way from Rio de Janeiro to San Pedro for a cargo of fuel oil.

"The military service of the United States has used the canal for the passage of one army transport and one navy collier, both from Pacific to Atlantic.

"In the week from noon, October 20, to noon October 27, following the resumption of traffic through the canal after the opening of the channel opposite the new Culebra slide, 17 vessels were put through the canal from the Pacific to the Atlantic, and 21 from the Atlantic to the Pacific, a total of 38 vessels in seven days. Up to the end of the week, 71 commercial vessels and three launches had passed through the canal in the 27 days of October.

INSURANCE

Articles on the Theory, Practice and Experience of Insurance

Notes on Insurance, American and Foreign

Items of Insurance News

ARE we about to have in the business of fire insurance a state of things similar to that which already exists in that great department of our economic life, the railroads? Is every movement of the free initiative of the managers of fire insurance in the United States to be checked, hampered and often completely thwarted in the same manner as the plans of our railroad managers for dealing with the unavoidable conditions they have to meet, are visibly checked, hampered and largely thwarted by the regulatory interference of the Interstate Commerce Commission? When new problems must be solved, new adaptations of means to ends arrived at, new difficulties overcome, in the business of fire insurance, are we to have the same intolerable delays, the same intrusion of inconsequent issues, the same putting aside of what is actual in favor of what is collateral and specious, which have characterized the course of the Interstate Commerce Commission in dealing with the question of railroad rates during the past decade?

A reaching of the series of model laws for the control of fire insurance rate making, which have been formulated by the Committee on Fire Insurance Rates and Rate Making of the National Convention of Insurance Commissioners and adopted by the Convention at its meeting in New York this week, cannot but raise these questions in the minds of all those who are more concerned with the future vigor and efficiency of fire insurance than with the minor defects and abuses that must be expected to develop in any branch of business, but which for the most part need only to be let alone to work their own cure. Of the bills referred to there are six, attacking the subject of fire insurance rates, rate making and rate discrimination from as many angles. Through them all, however, runs a single conception, derived substantially from the politically popular theory of rate making for railroads and other public service corporations, viz. that the presumption always must be that those who supply any form of service "affected with a public use or interest" will, if left to their own method of arriving at the proper rates for such service, abuse their power, work hardship and injustice upon those dependent upon the service, and in general pursue ends which are alien from the good of the community as a whole. Hence the assumed desirability of subjecting those potentially anti-social persons, the providers and administrators of the various forms of public, or asserted public service, not to general laws (which might not catch and cover all their devices), but to public officials, under whatsoever name, with the widest discretionary authority to interpose at a moment's notice and in respect of every detail.

The six model laws, about fire insurance rate making, approved by the National Convention of Insurance Commissioners for adoption by the legislatures of the States, undertake to formulate step by step a virtually compulsory system for making the rates of fire insurance throughout the country, and finally to bring the rounded whole of the system completely under the control of the Insurance Commissioners themselves. Bill Number 1 provides for the supervision of all fire insurance rate-making bureaus by the Insurance Commissioners of the respective States in which they are located. Bill Number 2 prohibits the fixing or charging of a rate by a fire insurance company or rating bureau "which discriminates unfairly between risks in the application of like charges or credits or which discriminates unfairly between risks of essentially the same hazards or having substantially the same degree of protection against fire." Bill Number 3 compels every fire insurance company or insurer to "maintain or be a member of a rating bureau," and requires every bureau,—apparently even one maintained by a single company or insurer,—to "admit to membership any authorized insurer applying therefor." Bill Number 4 requires a physical inspection and a written survey to be made of each risk specifically rated,—only dwelling houses and other risks for which a flat rate is quoted being excluded from this provision. This bill further compels the classification of every risk rated, in accordance with the Uniform Classification of Occupancy Hazards adopted by the National Convention of Insurance Commissioners. Bill Number 5 regulates the making of agreements between fire insurance companies and other insurers or between such companies or insurers and rate making bureaus with respect to the fixing and collecting of fire insurance rates. And, finally, we come to Bill Number 6, which is the keystone of the arch of regulation and which, for that reason, it is well to give in full, in its alternative forms (i. e. as suited to States allowing rate agreements and to States prohibiting the same):

"A bill authorizing hearing upon and review of the rates fixed by any bureau for fire insurance upon property within this State.

"Section 1. The Commissioner of Insurance shall have power, on written complaint or upon his own motion, to review any rate fixed by any bureau for fire insurance upon property within this State for the purpose of determining whether the same is discriminatory or unjust. He shall have power to order the discrimination removed or to fix and order substituted a bureau rate which is not discriminatory or unjust. A review of such rates before the Commissioner of Insurance shall be had only after due notice and hearing, and his findings or order shall in all cases be subject to summary court review by a court of competent jurisdiction of this State. In the event of final determination against any insurer, any overcharge during the pendency of such proceedings shall be refunded to the persons entitled thereto.

"Where the law prohibits all agreements as to the collection of the rates, including the prohibition against agreements that membership in a bureau shall be maintained for a specified period, or that a member shall refrain from maintaining its own bureau, the foregoing Bill Number 6 should be changed by striking out the words 'or unjust' following the word 'discriminatory' and by striking out the words 'or to fix and order substituted a bureau rate which is not discriminatory or unjust,' and inserting in lieu of the latter the following: 'No discrimination shall be removed by increasing the rate or rates on any risk or class of risks effected by such order, unless it shall be made to appear to the Commissioner of Insurance that such increase is justifiable, and an order of approval has been filed in his office.'"

Obviously, under the provisions of this last of the series of model bills, the powers of State Insurance Commissioners over fire insurance rates would equal, if they would not exceed, those of the Interstate Commerce Commission over railroad rates. It is, of course, impossible to foretell how much favor this proposed legislation will find with State legislators, or how many of these will adopt it in whole or in part. It is safe to predict, however, that if it is generally adopted throughout the country, no long period will elapse before there is the same paralysis in respect of the useful activities of fire insurance that is now plaguing us in respect of the railroads.

CAN INSURANCE EXPERIENCE BE APPLIED TO LENGTHEN LIFE?

By Arthur Hunter*

Chairman, Central Bureau, Medico-Actuarial Mortality Investigation

I HAVE stated my subject as a question, "Can insurance experience be applied to lengthen life?" and the answer is simple: It can. I have no doubt that the knowledge which the life insurance companies have acquired from their investigations regarding the mortality among their policyholders may be applied by individuals towards lengthening their own lives; but the difficulty arises of getting such information before the public in a form which can be readily understood. The investigations undertaken by the companies were primarily intended to assist them in determining which types of persons could safely be accepted for insurance at the regular rates of premium, which types should be charged an extra premium, and which should be declined. The purpose of the preparation of these statistics was not to excite public interest or curiosity, but for actual use in a great business. No haphazard methods have been used, but the most approved and scientific known to actuaries and medical directors; their knowledge of mortality is based upon the actual experience of companies with all sorts and conditions of men and women, and naturally appears in the form of statistics. Lest the word "statistics" should frighten you, let me point out that true progress in any science is made through recording the result of actual experience or of experiments, and that my statistics will be of this nature. They will constitute, in fact, a brief record of what has happened to mankind under certain conditions, and will not be difficult for the layman to follow.

Forty-three of the leading life insurance companies in the United States and Canada agreed in 1909 to prepare their collective experience on many different classes of insured. They decided to put the investigation into the hands of the Actuarial Society of America and the Association of Life Insurance Medical Directors. The companies supplied their records on about 2,000,000 lives, covering a period of twenty-five years. It is the largest and most comprehensive investigation ever undertaken by insurance companies anywhere. The object of the investigation was to determine from past experience the types of lives among which the companies had a higher mortality than the average. The results of the investigation have appeared in four volumes, and the fifth is in press. It has taken the Central Bureau about three and a half years of continuous labor to produce the results, using the most up-to-date machinery in the way of electric sorters and tabulators. A card was supplied for each of the policies issued from the years 1885 to 1909 among certain types, the history of the person being given on such card.

The insured were divided into many classes, of which the following are the chief groups:

1. Those who were in occupations involving hazard;
2. Those who had a family history of consumption;
3. Those who had a defect in their personal history, such as an attack of appendicitis, renal colic, rheumatism, syphilis, etc.;
4. Those whose physical condition was not normal, as shown by indications such as a high pulse, irregular pulse, albumen in urine, etc.;
5. Those whose habits with regard to alcoholic beverages were not satisfactory in the past, or who used liquor steadily at the time of application for insurance;
6. Those who were distinctly overweight or underweight.

It would be impossible to cover in a brief paper any but a very few of the important classes. Before describing these classes I should like to emphasize the fact that all the lives involved in the investigation had been carefully examined by competent physicians, and that, in general, the more hazardous the occupation, or the greater the defect in physical condition, in family history, or in personal history, the more care was taken in selecting the lives. For example, in the case of applicants who were 20 per cent overweight insurance would be granted in the majority of cases, but among those of extreme overweight very few would be accepted, and these would be the best of their kind. In order to determine the relative mortality, a standard or "measuring rod" was prepared, representing average mortality among insured lives, based upon the experience of the forty-three companies among all their insured. It is not necessary to describe this standard—merely to point out by an example the method of using it. When a class is said to have 10 per cent extra mortality, it means that where the experience of the companies would have resulted in 100 deaths among their insured as a whole, there were 110 deaths in the specified class. Another way of making the needed comparison is by showing the number of years by which the average lifetime will be reduced, and this manner of exhibiting the degree of hazard will be used in some cases. In this connection it may be well to point out that a reduction in the average lifetime of, say, five years among a large group of men is a serious matter. It does not mean that five years is taken off the lifetime of only those who have reached age sixty-five or seventy, but that the average lifetime of all men is reduced by five years. If in an occupation employing many men, such as mining, there were such a reduction, it would mean an economic waste in the United States equivalent to about five years of the lifetime of one million men, or a reduction of their productive lifetime by about one-sixth.

There were ninety-seven different occupations in which the relative mortality was determined. I shall here deal only with three groups of these occupations.

Railroads. One of the significant results of the investigation was the high mortality experienced among railroad men. Among locomotive engineers, for example, the mortality was 60 per cent in excess of that experienced among the insured as a whole, which is equivalent to five years' reduction in the average lifetime. If these locomotive engineers had been in a non-hazardous occupation, there would have been about 337 deaths, and there were actually 541 among them. Such a death rate can be reduced, as is proved by the results of the splendid efforts being made by a number of the leading railroads to educate their employes to assist in keeping down the accident and death rates. Some of the leading railroads issue monthly pamphlets, showing the best manner of coupling cars, shutting off air brakes, etc. They publish lists of men who have done good work in reporting deficient couplings, defective rails, etc., which might lead to accident. These railroads impress upon the men in every way the necessity of safety for themselves, and the effect which care on their part is likely to have on the future of their families. As a result of this campaign there has been a great decrease in the number of deaths. During the first six months of 1914 there was a decrease of one-third in the number of deaths among employes of one of the leading railroads over the corresponding period of 1913; and there was a decrease of one-quarter in the number of employes injured in the same period of 1914, as compared with the first six months of 1913. As in both of these years the company had in effect its plans for the safety of its

*An address delivered before the Eighth Annual Meeting of the Association of Life Insurance Presidents, December 10, 1914.

employes, the above figures show that there is a continued improvement as the result of this campaign, and that the employes are learning to realize the advantages which accrue therefrom.

Mining Industry. One is also greatly impressed with the needless waste of life in connection with the mining industry. The mortality among working miners in all underground metal mines was more than double that among other insured lives. This is equivalent to an average reduction of fully nine years in their lifetime. If these men had been employed in non-hazardous occupations, there would have been about 280 deaths, while there were actually 642 deaths. More than 150 of these deaths were due to mining accidents. That a great reduction in the death rate from accident is possible may be inferred from the experience in corresponding occupations in Belgium, Germany and Great Britain.

Pneumonia and tuberculosis both cause a very high death rate among miners, and this can largely be prevented through systematic education and through co-operation between the employers and the miners' unions. Much can also be done in reducing the number of accidents in the mines by such co-operation.

Space prevents my taking up other classes of the mining industry, and I shall therefore only state that the mortality was high among all classes of miners, including foremen, both in underground and surface mines.

Liquor Business. There is a general impression that saloon keepers do not live as long as persons in non-hazardous occupations, but it is not generally known that most classes which are connected with either the manufacture or sale of liquor have a high mortality. Among saloon proprietors, whether they attended the bar or not, there was an extra mortality of 70 per cent; and the causes of death indicated that a free use of alcoholic beverages had caused many of the deaths. The hotel proprietors who attended the bar either occasionally or regularly had as high a mortality as the saloon keepers, i. e., the lifetime was reduced about six years on the average on account of their occupation. The mortality among those connected with breweries was about one-third above the normal. The large class of proprietors of wholesale liquor houses had an extra mortality of about one-fifth. In the fourteen subdivisions of the trades connected with the manufacture or sale of alcohol, there was only one class which had a normal mortality, and that was the distillery proprietors. The facts regarding the adverse effect on longevity of engaging in the liquor trade are such that, if they were generally known, young men who are easily tempted would be deterred from entering this business.

The high mortality in some of the occupations to which reference has been made must not be ascribed to the men having other defects, such as a tubercular family history. Where there was any defect in the physical condition, in the family record, in the habits of life, etc., the insured was not included in the investigation of the mortality of men in the occupation. In the same way, in investigating the mortality of insured with a defect in family record or personal condition, no men in hazardous occupations were included in the groups investigated.

There were forty-nine classes investigated in which the insured had a defect in his physical condition, personal history, or family history. I shall refer only to a few of these in which the public are likely to be most interested.

Syphilis. It has generally been assumed that syphilis increases the death rate, but no facts relating to this country have hertofore been published showing the serious effect of that disease on mortality. The forty-three companies accepted only the better type of cases with a history of syphilis. Taking all the cases in which the insured admitted having syphilis prior to the date of application for insurance, the companies had 274 deaths, while the normal mortality would have been about 153; that is to say, there was an extra mortality of about 80 per cent due to that disease. The same results have been found in other countries. For example, among the men insured with the principal German company there were 487 deaths among those who had undergone treatment for syphilis, while there would have been only 290 deaths according to the experience of that company among all their insured lives; the excess mortality was therefore nearly 70 per cent. The only other published investigation of which I am aware was that made by the Scandinavian companies, which showed a mortality as high as in the German company to which I have just referred. This is sufficient evidence of the bad effect of syphilis on the individual. It is hardly necessary to mention that, in addition to shortening men's lives, it shortens their period of activity while they are alive. Locomotor ataxia and softening of the brain are believed by medical men to be due to syphilis in the majority of cases.

It must not be assumed that the high mortality is due to the companies accepting cases which had not been properly treated for syphilis. One of the classes consisted of men who had had two years' continuous treatment, and one year's freedom from symptoms prior to acceptance by the insurance companies, yet the excess mortality was 80 per cent—a decreased lifetime of about six years. A disease which shortens the life and limits the activity of the individual, and which causes untold misery and suffering to the progeny, should be and can be banished by an intelligent public opinion.

Habits as to Alcoholic Beverages. Nothing has been more conclusively proved than that a steady free use of alcoholic beverages, or occasional excesses, are detrimental to the individual. In my judgment, it has also been proved beyond peradventure of doubt that total abstinence from alcohol is of value to humanity; it is certain that abstainers live longer than persons who use alcoholic beverages. The low mortality among abstainers may not be due solely to abstinence from alcohol, but to abstinence from tobacco, and to a careful regard for one's physical well being.

Among the men who admitted that they had taken alcohol occasionally to excess in the past, but whose habits were considered satisfactory when they were insured, there were 289 deaths, while there would have been only 190 deaths had this group been made up of insured lives in general. The extra mortality was, therefore, over 50 per cent, which was equivalent to a reduction in the average life of these men of over four years. If this meant that four years would be cut off the end of the average normal lifetime of each man, there are many who would consider that "the game was worth the candle"; but it means that in each year a number of men will die at an earlier age than they should. For example, at age thirty-five, the expectation of life is thirty-two years: in the first year after that age, instead of, say, nine persons dying, there would probably be twelve deaths; that is, three men would each lose thirty-two years of life; in the next year probably four men would each lose thirty-one years of life, etc. As a matter of fact, many immoderate drinkers would live longer than thirty-two years, but not nearly so many as would live if they had been moderate drinkers, and far fewer than if they had been total abstainers from alcohol.

With regard to men who had used alcoholic beverages daily but not to excess, the experience of the companies was divided into two groups: (a) men who took two glasses of beer, or a glass of whiskey, or their equivalent, a day; (b) men who took more than the foregoing amount, but were not considered by the companies to drink to excess. The mortality in the second group was found to be fully 50 per cent greater than in the first—an excellent argument for moderation in the use of alcoholic beverages. The fore-

going result does not mean that the large excess mortality in Class (c) was due to their drinking a little more each day than those in Class (a). It is probable that among those who were very moderate users of alcoholic beverages there were comparatively few who eventually used liquor immoderately; but among those who took more than a glass of whiskey or its equivalent a day there were probably a goodly number who increased their daily consumption after having applied for insurance, and who eventually drank to an immoderate extent. Part of the hazard from alcoholic beverages lies in the user losing the power to limit himself to a moderate consumption.

Among the men whose habits were formerly intemperate but who had reformed for at least two years prior to their acceptance by the insurance companies, the extra mortality was fully 30 per cent; i. e., their average lifetime was reduced by about three years. This excess mortality is partly due to the effect of previous intemperate habits in undermining the system and partly to a proportion of the persons relapsing into their old habits.

In the foregoing classes men who were in the liquor business, or in any other occupation involving hazard, were excluded.

The committee of the Medico-Actuarial Mortality Investigation did not make a report on the mortality among total abstainers, but sufficient statistics have been published by individual companies to justify the statement that persons who have always been total abstainers have a mortality during the working years of life of about one-half of that among those who use alcohol to the extent of at least two glasses of whiskey per day. In a view of this, the effect of prohibition of the manufacture and sale of alcoholic beverages in Russia must be very great. If the Government of Russia carry out their present intention to abolish permanently all forms of alcoholic beverages, the saving in human ilfe will be enormous. It is not too much to say that the loss of 500,000 men as the result of the present warfare could be made good in less than ten years through complete abstinence from alcoholic beverages by all the inhabitants of Russia. In the "New York Times" of November 19 a former member of the Duma, a man who has worked for prohibition in Russia for many years, Michael Demitrovitch Tehelisheff, states that already the results of the abstinence from vodka are seen in the peasants; "they are beginning to look like a different race." He states that in the factories the efficiency of the worker has greatly increased, that women and children who suffered from violence of the husband and father through his addiction to vodka "suddenly found themselves in an undreamed-of paradise. There were no blows, no insults, and no rough treatment. There was bread on the table, milk for the babies, and a fire in the kitchen."

Pleurisy. What may the public learn regarding such an apparently uninteresting subject as the death rate in an insurance company from pleurisy? They may learn that the deaths from tuberculosis of the lungs among persons who had had pleurisy within five years prior to insurance were three times the average number. The public should be told that an attack of pleurisy is followed in many cases by tuberculosis, and that, accordingly, after an attack of pleurisy every precaution should be taken to guard against infection from tuberculosis.

Family Record of Tuberculosis. Twenty years ago it was believed that tuberculosis of the lungs was directly inheritable, and, accordingly, it was the custom of most companies to decline to grant insurance on applicants either of whose parents had died of tuberculosis of the lungs. After it was ascertained that tuberculosis was apparently due to contagion, the companies liberalized in their treatment. It was noted, however, that there was an excess mortality among persons with a family history of tuberculosis even when care was taken against contagion, and many physicians were led to believe that a predisposition to that disease could be inherited. In the latest investigations it has been feasible to make subdivisions with a view to determining the types of persons among whom the mortality had been high, and thereby to arrive, if possible, at the reasons for the apparent pedisposition to tuberculosis. Among light weight men who had a parent die of tuberculosis, the mortality was high at the younger ages, but normal at the older ages. It may be said, in general, that, except at young ages, the longevity of persons above the average weight is not affected by a family history of a parent dead from tuberculosis. The mortality among men who had a brother or a sister die of tuberculosis was not materially different from that among men who had a parent die from that disease.

Unfortunately, these statistics do not show definitely whether or not a predisposition to tuberculosis is hereditary, but it has been indicated that there is a predisposition to light weight, which is a condition favorable to the development of tuberculosis. Among young men who were, when insured, at least 25 pounds under the average weight, and who had a parent, brother or sister die from tuberculosis, out of every ten deaths five were due to tuberculosis. This is an appalling waste of life, which could be greatly decreased by proper care and sufficient nourishment. Among young men with the same family record of the disease, who were slightly overweight, three out of every ten deaths were from tuberculosis; while among those distinctly heavy, out of every ten deaths only one was from tuberculosis. A well-nourished man, taking reasonable precautions against contagion, has little to fear from tuberculosis. The lesson to be drawn by the community from the experience of the insurance companies is that the inhabitants should be well nourished in order to reduce the great economic waste which comes from tuberculosis. That this waste is very costly there can be no doubt. Dr. Hurty, the Indiana Health Commissioner, states that "the cost of preventable consumption to the people of Indiana is not less than ten million dollars a year."

Among persons who were very light in weight but who had not a family record of tuberculosis, the death rate from that disease was high.

During a time of war the dependents of those in the army and navy are looked after by their governments, although generally in an inadequate way; but in time of peace comparatively little attention is paid to the dependents of those afflicted with tuberculosis, frequently acquired as the result of conditions which the governments could prevent. There is unquestionably a great need for the State or the community providing means of subsistence for the families of the breadwinners under treatment for tuberculosis. As great a need also exists for suitable employment for those who have recently been cured of tuberculosis and who are not yet fitted for their regular occupation, or must change from indoor to outdoor work. It is beginning to be recognized that the man or woman afflicted with tuberculosis should not be hindered from recovery by anxiety about the conditions of their dependents; but it is equally important that the bread winner should not be required to take up hard or unsuitable work too soon after recovery, because a relapse means that the treatment must begin again with a discouraged patient.

Influence of Overweight on Mortality. There is no doubt that marked overweight has a material effect in decreasing length of life, especially at the middle and older ages. For example, among men forty pounds above the average weight the lifetime of those who entered the companies at age forty-five was about four years less than that of men of normal weight. The public should understand that marked overweight is a serious handicap to length of life, and that the adage, "Laugh and grow fat," is not good advice

for the man or woman who is inclined to be heavy. Diabetes, Bright's disease, heart disease, and apoplexy cause a large proportion of the deaths among the overweights. While the over-eater is not such a bad social influence as the excessive drinker, the former is also shortening his life by lack of moderation.

In conclusion it should perhaps be stated that the statistics of the Medico-Actuarial Mortality Investigation were not compiled with intent to prove or disprove a particular theory, as so frequently happens when partisans engage in the preparation of statistics in support of their point of view. The companies put their records in the hands of a committee of actuaries and medical directors and asked them to determine what the true experience has been. The statistics, therefore, represent the facts.

This investigation shows effects of incorrect living and frequently indicates the way in which improvement may be made. The officers of the companies are glad to have such information given to the public, since they know it will be of direct benefit in reducing the death rate and because they are interested also in such matters from the standpoint of the general welfare.

THE RELATION OF LIFE INSURANCE TO THE CREDIT FABRIC OF BUSINESS

By Hon. A. Barton Hepburn*

Chairman of the Board of Directors, Chase National Bank, New York

I AM asked to discuss "the relation of life insurance to the credit fabric of business," from the viewpoint of a banker.

In 1879 I was chairman of the Assembly Insurance Committee of the New York Legislature, a position unsolicited and undesired, but a position which forced upon me more or less study of the subject of life insurance. The Continental, Knickerbocker, Globe and other companies failed, and the failures were bad ones; public sentiment was greatly aroused and the demand for immediate legislation was importunate. All attempts at legislation that year failed, because every measure was loaded down with punitive provisions, *ex post facto* provisions, not only unwise but unconstitutional. It required the lapse of a year for the temper of the public to cool down sufficiently to permit of the enactment of wholesome legislation.

In 1879 the total resources of the Prudential Insurance Company were $201,891, and outstanding insurance was $3,866,913; in 1913 the total resources of the Prudential had grown to $335,478,783, and outstanding insurance, ordinary, to $924,362,877, industrial, $1,462,515,043. In 1879 the resources of the Metropolitan Life Insurance Company were $2,022,482, and its total outstanding insurance amounted to $11,150,349; in 1913 the total resources of the Metropolitan were $447,972,405 and outstanding insurance, ordinary, amounted to $1,038,089,393—industrial insurance amounted to $1,778,415,069. The aggregate resources of the New York Life, Mutual, Equitable, Prudential and Metropolitan were, in 1879, $166,296,822, and their aggregate outstanding insurance was $603,553,606. According to their reports for 1913, the aggregate resources of these companies had grown in the intervening 34 years, to $2,694,591,746, and their outstanding insurance had reached the enormous total of $7,325,711,135 of ordinary insurance, and including the industrial insurance of the Metropolitan and Prudential, the grand total reaches $10,566,042,247.

I have presented these figures in this way, in order to emphasize the fact that these institutions are the greatest investment banks in the world; and indeed they practice a measure of commercial banking, since life insurance companies have adopted the policy of loaning to the insured upon their policies as collateral. A contractual obligation is written into the policies, whereby they agree to loan a certain percentage of the surrender value at a fixed rate of interest at any time when the insured may require the same. Policyholders are coming to realize this privilege and the volume of these loans is constantly on the increase. The aggregate amount of such loans, according to the 1913 reports of the five companies above named, was $356,280,312.92. Such loans, of course, offset and reduce the amount of insurance. Such disadvantage must be more than counterbalanced, in the opinion of life insurance managers, by the commercial value, the availability as collateral, which the borrowing privilege gives to the policy.

The asset side of life insurance may be classified as banking—in one form or another. Should not the banking character of life insurance companies impose upon them, measurably, the same obligation to support the credit fabric of the country, as rests upon other forms of banking? If savings banks, trust companies and commercial banks are required by law to keep a reserve against their liabilities, should not life insurance companies, in the conservatism of good management, keep liquid funds available in case of need? Should not the liquid character of their assets contribute to the general protection of the public credit in times of stress and stringency? I by no means lose sight of the differentiation between life insurance and banking, and I am not advocating fixed legal requirements of reserve, but in view of the policy loans to the insured, it can no longer be said that a man must die before any demand upon the company can result from his policy of insurance.

My understanding is that the wisdom of such a general policy was recognized and practiced up to the time of the recent insurance investigation. Then large bank balances were paraded, coupled with the charge that they were excessive, maintained as a matter of favoritism in institutions whose stock was largely owned by the trustees, or where the trustees were especially favored in respect to loans. To the extent to which such charges were true, it represents, of course, a wrong which rightly called for correction. That time and those conditions have passed, however, and the proper relation of life insurance management to the credit fabric of the country is, it seems to me, a question of importance calling for careful consideration on the part of life insurance managers.

As to the liability side, the functions of an insurance company are not eleemosynary; they do not give alms, but they do sell protection, they insure against the extremes of misfortune and graduate the vicissitudes of life; they are not money-making institutions, but enable the general public to mutualize their strength and helpfulness, and minimize the loss and hardship which would otherwise exist. That is the attitude which the companies have assumed and which the public have accepted, and now insist that such relationship shall be maintained.

Some companies are capitalized, but public sentiment limits dividends to a very moderate percentage, and insists that all overplus earnings be held for the benefit of the policyholders. All companies are essentially mutualized in their administration; the amount received in premiums exceeds the amount paid for losses only by an amount representing the cost of management and a proper and wholesome reserve. All benevolent work deserves commendation. The figures I have given you, showing the growth of life insurance in force, show the public appreciation of this greatest of all humane instrumentalities for equalizing the burdens and alleviating the sufferings of mankind, which would otherwise exist. Time was when a life insurance agent had to weave a spell, to fascinate with

*An address delivered before the Eighth Annual Meeting of the Association of Life Insurance Presidents, December 10, 1914.

fluent phrase to induce the sale of a policy. Now, if a business man is known not to have a life insurance policy, it excites the query, "I wonder why?" Of course the premiums exceed the death losses, and long years of payment enable the companies to meet the presently occurring losses. I have never known any one to regret these constantly recurring payments, year after year, and all the while the insured has had protection. Anxiety and worry yield to the comforting conviction, day by day, that his insurance will enable his estate to make full restitution to those who have given him their confidence and credit, or better still, that his insurance will care for and maintain his loved ones when his supporting hand no longer avails.

The Good Book tells us that "a contented mind is better than great riches." Life insurance has been most effective in bringing the contented mind within the reach of all.

Life insurance companies and banks both deal in credit and subsist upon credit, and both draw from the public the financial resources with which they in turn serve the public. The reservoir, filled by the inflowing stream of premiums, is drained by the outgoing current of ascertained losses. The asset side of life insurance deals wholly with credit; on the liability side, your outstanding insurance depends upon your credit with the general public, upon their belief in the honesty and efficiency of your management and your financial ability to meet the obligations contained in such insurance. You would not insure a known crook, however flattering your physicians might report his physical condition to be, nor would a bank make a loan to a known crook, however choice the collateral offered might be. To quote the late J. P. Morgan, "Character is fundamental in all business transactions, or should be." The exigencies of business compel us to have arm's length relations with all sorts of people, but we establish a community of interest only with those whom we trust and whose character we believe to be worthy and well established.

Fifty or sixty years ago banks of this country did business upon their capital, reinforced, in many instances, by the issue of bank note currency. The money of the people and corporations was in active use—bank deposits were negligible. The growing wealth of the country has changed this, and now the business of banking is done upon deposits, capital and surplus being only sufficient in amount to margin the business and command public confidence.

The individual wealth of our citizens has made bankers more and more dealers in credit, by furnishing the major part of their banking power, by giving the banks credit, in form of deposits, as well as by utilizing their credit with the banks. If a man or corporation wished to open an account, the line of investigation as to the individual or the individuals managing the corporation would first be directed to their character, honesty, temperance, sobriety, industry, forethought, efficiency, prudence, the quality of looking ahead and providing for eventualities, and their financial resources and property strength.

The initial inquiry would naturally take the form of a personal interview, and at some point in such an interview between a banker and a would-be depositor or debtor, the inevitable inquiry would suggest itself, "Have you any life insurance, and if so how much, and in what companies? Does it run to your estate, or to some named beneficiary?" Such an inquiry would be important because of its bearing upon his financial power, but vastly more important as showing his trend of mind, the extent to which he assumed personal responsibility, whether he was caring for the present and immediate future only, or whether the range of his vision and his activities looked to the protection of his estate and his family after his demise. (We live under the shadow of the Stock Exchange, and it may be well to remark that money on the Exchange is, theoretically at least, loaned to the highest bidder, and such loans are an exception to all usual credit rules.) The quality of mind which induces one to take out life insurance is the quality of mind that best insures success in business.

The business of the world is dependent almost entirely upon the maintenance of credit relations among men. If we ever lose sight of this fact, its truth is presently borne in upon us by some financial depression, panic, great labor strike, or war.

Business transactions on a large scale, such as we of this age have become accustomed to regard as matters of course, but which would have been the marvel of earlier generations, arise out of man's faith in the promises of his fellow-men. Agreements to do or not to do certain things, which in diplomatic circles may sometimes be regarded as "mere scraps of paper," but never in business circles, afford the means by which commerce of present-day magnitude is carried on throughout the world. Credit of the kind we are considering may almost be defined as man's faith in man and in man-made institutions.

We have established a new banking system, to the end that we may have better credit facilities. The President of the United States took occasion to refer to the importance of the event, saying, among other things, that "credit is the very life of trade; the very air men must breathe if they would meet their opportunities." And so, indeed, it is.

It is almost as difficult to separate the matter of credit from our daily deals and examine its constituent elements, as it is to isolate a particular bacterial cell from thousands of others for the purpose of studying its peculiar characteristics, so intimately is credit intermingled with every business transaction. Even in sales where men feel that they are trusting nobody, we find credit involved in the currency that is being paid in the "cash transaction."

The machinery of credit is made up of governmental agencies, banking institutions, customs of business, courts for the enforcement of contracts, and in many other practical devices having their origin in law. But underneath the great superstructure lies the credit foundation, consisting of ability and determination on the part of men to meet their obligations at maturity.

It has been the custom of business men, in extending credit, to lay much stress upon financial ability to pay, and this element, coupled with laws which make it possible to enforce payments when property is available for that purpose, is of great importance. But does not the average business man put too much emphasis upon a man's financial ability to pay, and too little upon those personal traits which are comprehended within the general term "determination to pay"? In other words, do we not pay too much attention to property qualifications and too little to personal qualities? The law's delays and the law's circumvention permit property to melt away, but the element of personal honesty and the quality of efficiency do not change with time.

With such thoughts in mind it is interesting to note the activities of life insurance companies, in urging life insurance, as a means of circumventing the disaster almost sure to follow, in cases where death removes from the management of a business the man whose foresight and ability have made the business a success. Of course, the mortality chances in such cases, under the law of average, may not be very great, but they are chances which a concern, dependent largely upon one life, may well hesitate to take. Hence, the growing custom, to shift the risk to a company, which, by insuring many lives, invokes the law of average, thus making certain that its losses shall not in the aggregate be abnormal. I am told that this kind of insurance is now being written in large amounts to cover, not only the dependence of one partner upon another, but also of corporations upon their man-

aging geniuses, their inventors and other persons upon whom success is largely dependent. Life insurance is also being made to serve the useful purpose of insuring creditors against the death of debtors whose ability to pay their debts is more dependent upon their living than upon the amount of property they may own. I borrowed money to finish my education, and had my life insured as collateral. The party making the loan believed I would repay the same if I lived, and that the insurance company would if I did not. These useful functions tend to remove uncertainty and chance of loss from daily business transactions, which is most important in establishing and maintaining credit relations. It shows how rapidly and how intimately life insurance is being interwoven with current business.

There is another feature of life insurance about which I would like to speak, and on which I would lay much emphasis, because I feel that it has not been fully appreciated. I hardly know what to call it, unless it be the psychological significance of life insurance as it should be viewed from a creditor's standpoint.

When it comes to extending credit, the average business man does not, perhaps, have in mind any set of rules or formulae. He does not attempt to analyze and catalogue the qualities the applicants should possess, as a basis for the credit they ask. He reaches a conclusion by the short cut to which he is accustomed, viz.: the man's manner, appearance, reputation, financial standing, and somewhat by his words and promises. He should in some way, either general or specific, by inquiry or intuition, seek and obtain answers to a number of questions such as these: Has the man ability, self-control, prudence and forethought? Is he cautious, frugal and normal in his habits of life? Has he a sense of justice and a proper regard for the rights of others? Is he accustomed to assume responsibility, and does he understand the need for being prepared to meet emergencies? Is he home-loving, industrious and mindful of duty? Is he progressive, and likely, therefore, to keep pace with his competitors? Does he know how to get money's worth for money expended? Is he fickle and erratic, or are his habits fixed and his purposes in life well-defined? Has he integrity and reputation and does he cherish his standing among his fellowmen? Is he selfish and self-centered, or does he think of others, and especially of wife, children and those who may be dependent upon him?

Surely it will require no argument before a group of life insurance experts to prove that a careful and detailed inquiry as to the life insurance a man carries would shed light upon each of the questions I have attempted to formulate and to which many others of similar import might well be added. Suppose, for example, in seeking information as to a man's forethought, prudence, caution, frugality, unselfishness, reliability and other qualities which go to make up high character and good repute, we should ask how much life insurance he carries, of what kind and for how long has it been carried, in what companies has it been taken out and is it for the protection of the family or the business or both? Could we find anywhere better evidence of the working of the man's mind, of his habit of life, of his sense of responsibility, and, in fact, of all those qualities upon which we must rely for fulfilment of promises so far as personality is concerned? Of course, inquiries concerning a man's life insurance will not answer all of the questions involved in the matter of extending credit, nor any of them conclusively, but I doubt if there is any one line of inquiry that could be made of a man who has reached middle age, after having been engaged in business for several years, that would come as near showing both ability and determination to meet obligations and keep promises.

The need for making such inquiries is of growing importance. There was a time when it was the rule, even among conservative business men, to carry largely, if not entirely, risks of fire, accident and death, against which to-day it is almost the universal custom to insure. Then a lack of life insurance did not carry special insignificance. Now the failure of a man to take the precautions which are commonly taken by his fellowmen is a fact of such importance as to put the prospective creditor on notice, and call for careful inquiry as to why he thinks he can disregard what has come to be the common judgment of mankind. Or, to put it another way, the man a generation ago who carried life insurance of large amount was so exceptional as to excite inquiry as to his reasons and motives for so doing, while to-day it is the man who thinks he can afford to do without life insurance that is subjected to inquiry.

Banks have long been accustomed to ask large borrowers for a statement of the life insurance they carry, and it seems to me that commercial agencies, like Dun's and Bradstreet's, should ask for similar information for use in reaching a conclusion as to the credit-rating to which a man is entitled. Such information is certainly valuable contributory evidence.

In urging the psychological element in credit transactions, as disclosed by the life insurance a man carries, I have in mind largely those dealings in which security is neither asked nor expected—dealings in which property is exchanged for mere promises to pay. As to such transactions, faith is, and must be, put in a man who makes the promise and in his habits of mind and conduct, which have crystalized into what we are accustomed to term reputation. I fear we sometimes overlook the fact that in making inquiry about a man's property and the profitableness of his business, we are really seeking information concerning the qualities which have led to his success in business. It has occurred to me that the combined records of life insurance companies, showing those who have insured and carried insurance for some time, those who have borrowed on their policies, and those who have not committed this offense against their beneficiaries, would afford an excellent credit-rating of the men whose names would thus appear. It is almost regrettable from the credit standpoint that such information must be deemed confidential by the life insurance companies. Men seem to pride themselves upon their property ownership and do not object to its being known in business circles, partly, no doubt, because this is customary and generally regarded as evidence of the possession of those characteristics which give reputation and standing among their fellowmen. Would not public knowledge of the insurance they carry also contribute to their credit-standing in the community?

The potent factor, the all-important factor in every business, is the management. Would you insure the machine and not the man? By every rule of prudence and conservatism, is not life insurance just as indispensable to credit as fire insurance?

Banking renders an indispensable service to the public and realizes its profit in the aggregation of very small percentages in multitudinous transactions. It is managed as a business and for gain. Life insurance management seeks no profit in the usual sense of that term; it holds and uses all net earnings for the benefit of the insured; the insured seeks no personal profit or advantage, but strives to protect his credit, shield his family and soften for them the asperities of life after he has passed beyond the realm of personal activity. Life insurance is unselfish, it is the tangible result of the better motives of human nature embodied in the form of practical relief; although interwoven with and closely allied to business, its impulse and its execution are sociological, altruistic; it is the regard for one's credit and the love for one's family, incarnate in tangible, enforcible contract, a beneficent instrumental-

ity, which enables the dead hand to control, in order to soothe, assuage, cherish and support.

THE INCREASING NEED OF LIFE INSURANCE FOR WOMEN

By Herbert C. Cox*

President, Canada Life Assurance Co., Toronto, Can.

THE problem of the insurance of women has ever been one of interest and difficulty because of the paucity of knowledge we have been able to bring to bear upon its solution. At a very early period we learn that woman as an insurable subject was considered most desirable; at another period—the companies having insured her on a lower premium rate than men because of her supposed superior longevity—we find her attractiveness quite dispelled by the unfavorable mortality experienced. At still another and later period, we find her again being wooed by life insurance companies, until presently practically all barriers to her acceptance have been removed.

As pointed out by Cornelius Walford, F. I. A., the earliest glimmering of the idea of woman as an interesting statistical subject was when Graunt, in 1661, made something in the nature of a discovery, namely, that in the City of London there was a preponderance of males over females, but that the females outlived the males, in spite of the fact, which had come under his observation, that "Physicians have two women patients to one man, yet more men die than women." He was, however, speaking only generally, and came to no positive conclusions.

In 1693 Dr. Hadley, in constructing the Breslau table of mortality, had not discovered the superior longevity of women, and it was not until 1742 that Kersseboom, in his investigations into the mortality of the Dutch Annuitants, took special note of that amongst females, and his data established the fact of their greater longevity. This information, together with further proofs supplied in 1746 by Deparcieux, an investigator of the French Tontines, was turned to advantage by the Dutch, who, when subscribing to a scheme of English Exchequer Life Annuities, nominated girls instead of boys, thus obtaining the benefit of the more favorable mortality.

Up to 1843 the confidence engendered by these discoveries had, as stated, resulted in the life insurance companies offering lower rates to women, which proved to be a sorry miscalculation, for in that year the tabulated experience of seventeen British offices demonstrated that the boasted longevity of women failed to assert itself when insured women were under observation.

The general experience from that time was that the insured female presented a doubtful aspect, and the unfavorable mortality gave rise to the suspicion that the offices had been grossly deceived by the woman applicants, who, it was asserted, could not have discharged their true physical condition to the examining physician. An excessive death rate in the first five years of risk seemed to bear out this contention, but no specific case of fraud could be discovered. Many suggestions were offered in explanation of this reversal of the former case for women as good insurable risks, it even being mooted that they were subconsciously warned of the approach of disease while they were still in a perfect state of health, and thus impelled by instinct they applied for insurance.

In 1861 the compilation of the well known Combined Experience Table of Mortality led to the conclusion that the greatest reliance could be placed upon a table which was based upon observation of male lives exclusively, as the mortality amongst insured females had been clearly shown to be higher than amongst insured males. The recent investigation made by the Actuarial Society of America still further confirms this finding, although the superior longevity of women in general is still unquestioned.

This wide divergence in experience as exposed by a comparison between insured and uninsured women we may in large measure account for by a review of the practice of the companies which would seem to indicate that they have somewhat extensively adopted the method of waiting for female insurants to propose themselves. If the same procedure were followed in regard to men, the result would, in all probability, be similarly adverse. Officials and agents know the necessity of urging men to apply for life insurance and the voluntary applicant in some degree invites especial scrutiny of his desirability as a risk by this very offering of himself without solicitation. It would, therefore, seem that if the increasing need of life insurance for women is to be met, without undue stress upon the companies, we must adopt toward them the same attitude as toward men. It is not sufficient to accord them the same rates and plans, as has already been done quite commonly, but that we may create a favorable average our agency system must be extended to include an aggressive campaign amongst women of all classes, employing such safeguards as are reasonably demanded for the female risk in the same manner that hazards are guarded against in dealing with men in various occupations and walks of life.

That the occasion of insurance for women is great and urgent and largely unsatisfied is apparent, and we must perforce acknowledge that its need has far outgrown the machinery of the companies for supplying it, the personal solicitation which has been the great factor in the increase of insurance amongst men being almost entirely neglected. Probably less than 7 per cent of insurance risks are upon the lives of women. This surely cannot be considered a fair proportion, having in mind how very extensively woman has been thrust into the professional and industrial occupations by our modern civilization. In art, in literature, in law, in medicine, in education, in finance, in commerce, in manufacture, and even now in war the twentieth century woman is bearing her full share in the creation and conservation of the wealth of nations, and in the support of those for whom circumstance had rendered her responsible. While this increasing absorption of women in business pursuits may by some be viewed as constituting a danger to the State, on the one hand through giving them interests foreign to the home, and on the other through the effect of their competition with man, hereby lessening his earning capacity to the point where the forming of home ties is not feasible, it is nevertheless the outcome of present-day economic conditions and must be recognized as an integral part of our financial and industrial fabric. Charged, then, with the maintenance of themselves and sundry others, it would seem they perform a function as important to society as do their brothers, and they cannot logically and properly prosecute their avocations with independence and content without the provision and protection for the future of which those brothers have the advantage and which they also should be able to secure through life insurance. Every basic argument in support of insurance for men serves also to impress the necessity and desirability of similar protection for such women producers. In addition and of equal importance is the economic value to the State of having insured those women who have established for themselves a monetary value through becoming the support of others who may eventually but for the aid of life insurance become a charge upon the State.

Entitled also to consideration and insurance benefits are number-

*An address delivered before the Eighth Annual Meeting of the Association of Life Insurance Presidents, December 10, 1914.

less women of the home, whose lives represent a value which cannot be expressed in terms of money, but who nevertheless constitute one of our greatest national resources and present an indusputable insurable interest.

It would seem, therefore, that the life insurance companies have a duty in respect of these women who are sharing in the erection of our business and social structure, that our institutions should approach the obligation in the light of its broader relation to the community at large, and that, looking to its adequate discharge and the satisfying of the increasing insurance need of our women, we should set in motion whatever of machinery we may have or may be able to devise, having always in mind that it is also laid upon them by thier relation to the State to make, even at the cost of some individual discomfort, ample or possible provision for the perpetuation of their earning capacity in its application to others.

MAKING NEGLIGENT PROPERTY OWNERS LEGALLY RESPONSIBLE FOR THE COST OF FIRES

TO Fire Commissioner Robert Adamson, of New York City, belongs the credit of taking the first effective steps in this country towards making the cost of fires in which negligence has a part fall where it belongs, i. e. upon the negligent owners of the property which is burned. As long ago as 1871 the Legislature of New York afforded at least partial statutory means for doing this, and Chapter 742 of the Laws of 1871 contained the initial provision of law under which there may be a recovery by a city or other political sub-division of the State, of the expenses incurred in putting out fires resulting from wilful or culpable negligence of the owner of the property. Ever since 1871, the laws of New York have contained this provision, with some modification as time went on; and in substance it has been embodied in the charter of Greater New York. Yet during the whole period from 1871 to 1914 not a single action was brought against a property owner under the statute.

On January 31, 1914, a fire occurred in the basement of a building known as Nos. 212-214 East 99th Street, New York City, owned by the Greenwood Cemetery Corporation. The fire was a difficult one for the Fire Department of New York to extinguish, and several members of the department were more or less severely injured in the course of their duty. It happened that during November, 1912, the Fire Commissioner of the City of New York had served upon the owners of the building in question an order requiring them to equip the building with a system of automatic sprinklers; but the owners had neglected or failed to obey this order. In consequence of the lack of these automatic sprinklers the progress of the fire was rapid, and the fire extended to adjacent buildings. Some time after the fire the Fire Commissioner brought action against the owners of the property, in the sum of $1,500, for the expenses of extinguishing the fire, in respect of the use of employes, apparatus and materials for the same. The defendants demurred to the complaint on two principal grounds: (1) That there must be shown a criminal intent; and (2) that the failure to instal sprinklers did not start the fire. This demurrer was sustained by the Supreme Court, but an appeal was taken by the Fire Commissioner to the Appellate Division, First Department. This week a decision was handed down by the Appellate Division, reversing the order of the lower court and overruling the demurrer. Though this decision does not, of course, determine the matter at issue in this case, the opinion written by Judge Scott may be regarded as almost epoch-making, both in New York and in the United States, with regard to the possible means of asserting the legal liability of property owners for fires and the cost of extinguishing them, if not for all the loss occasioned by them. It is, therefore, printed herewith in full:

SUPREME COURT, APPELLATE DIVISION

First Department, November, 1914

George L. Ingraham, P. J.
John Proctor Clark,
Francis M. Scott,
Victor J. Dowling,
Henry B. Hotchkiss, JJ.

Robert Adamson, as Fire Commissioner of the City of New York,
Appellant,
against
Greenwood Cemetery,
Respondent.
No. 6482.

Appeal by the plaintiff from an order sustaining a demurrer as a contested motion.

Albert de Roode, for Appellant.
Edwin D. Bechtel, for Respondent.

Scott, J.

The complaint, summarized, alleges that in November, 1912, the then Fire Commissioner of the City of New York, pursuant to the authority conferred upon him by Section 775 of the Greater New York Charter, as amended by Laws of 1911, Chapter 889, made and served upon the defendant, the owner of the building known as Nos. 212-214 East 99th Street in the City of New York, an order that the said building be equipped with a system of automatic sprinklers; that the said defendant failed and omitted to comply with the said order and to equip the said premises with the system of automatic sprinklers ordered by the said Fire Commissioner, or any other system of automatic sprinklers; that on January 31, 1914, a fire occurred in the basement of said building and from its point of origin, extended to and set fire to other portions of said building and the contents thereof, and spread rapidly throughout the rest of the building and to adjoining buildings, being extinguished by the Fire Department with great difficulty and after injury to many members of the Department; that had a system of automatic sprinklers been installed in said building as ordered by the Fire Department, and maintained in good working order at the time of the fire, said fire would have been confined to that portion of the building in which it originated, and would not have spread, as it did, throughout and set fire to the rest of the building and the adjoining buildings. It is charged that the failure of the defendant to instal a system of automatic sprinklers constituted wilful and culpable negligence on its part, and it is alleged that by reason of this wilful and culpable negligence of the defendant the Fire Commissioner of the City of New York, without fault or negligence on its part, incurred in and about the use of employes, apparatus and materials, the expense of $1,500, which expnse would not have been necessary except for the wilful and culpable negligence of the defendant. Annexed to and forming part of the complaint by reference is an ordinance of the Board of Aldermen of the City of New York adopted December 19, 1911, and which went into force and became operative on January 1, 1912. The demurrer is for general insufficiency. The plaintiff relies upon two sections of the Greater New York Charter as warrant for the maintenance of this section. Section 773 provides in part as follows: "any person, persons or corporation, for the violation of or non-compliance with any

of the several provisions of the several sections of this Title, where the penalty is not therein specially provided, shall severally forfeit and pay a fine or penalty in the sum of $50 for each and every offense, and shall forfeit and pay the penalties respectively imposed under any of said sections and shall also be severally liable for any costs or expenses that may be incurred by any violation of or non-compliance with, any requirements under said sections and shall also be severally liable for the payment of the further penalty of the sum of fifty dollars ($50) and for any violation of, or non-compliance with any regulation, or special direction issued by the said Commissioner," etc.

Section 761, after providing for the recovery of damages for personal injuries suffered by members of the Fire Department, provides as follows, "and any and all persons for any fire resulting from his or their wilful or culpable negligence or criminal intent or design shall, in addition to the present provisions of law for the punisment of persons convicted of arson be liable in a civil action for the payment of any and all damages to the persons or property, the result of such fire, and also for the payment of all costs and expenses of the said Fire Department incurred in and about the use of employes, apparatus and materials in the extinguishment of any fire resulting from such causes, the amount of such costs and expenses to be fixed by the said Commissioner and when collected shall be paid into the relief fund of such Department herein created," etc.

Both sections above quoted are embraced in the same title of the Charter (Chapter 15, Title III) and are therefore to be read together. Section 773 provides generally that any person for non-compliance with any of the several provisions of what Title shall be liable for any costs and expenses that may be incurred by such non-compliance. Section 775, under which the order for the installation of automatic sprinklers was made, is a part of the same Title III. A failure to comply with an order made under Section 775 is therefore a failure to comply with the provision of Title III and subjects the offender to the consequences specified in Section 773 (Peo. vs. Kaye, 212 N. Y. 407-415), which includes liability for costs and expenses incurred by reason of non-compliance. Section 761 is more specific and provides when and under what circumstances a person who has been culpably or wilfully negligent and thus caused the fire, may be called upon to pay the damages resulting therefrom, what damages he may be charged with. It is not claimed and we do not hold that the only culpable and wilful negligence which would establish a right of action, under the Section last quoted, is the disobedience of an order of the Fire Commissioner. All that it is necessary to hold in the present case is that such disobedience as is set forth in the complaint establishes *prima facie* such culpable and wilful negligence. We think that there can be no doubt that it does.

The order of the Fire Commissioner requiring the installation of automatic sprinklers was presumptively valid and lawful, and non-compliance therewith subjected the owner of the building to the penalties provided for by the Charter (Peo. vs. Kaye, *supra*). The order being authorized by law and validly made and served has all the authority of a statute or ordinance and its violation of itself is sufficient to establish *prima facie* the defendant's negligence (McRikard vs. Flint, 114 N .Y. 222. Shields vs. Pugh & Co., 122 App. Div. 586).

In order to justify a recovery under the statute, mere negligence is not sufficient. It must be "culpable and wilful"; and it is alleged in the complaint that the defendant's negligence was both culpable and wilful.

Whether or not the failure to obey the order was wilful is a question of fact and the demurrer admits it. Whether it is culpable,—that is, criminal or worthy of punishment,—is a question of law dependent upon the facts proved, or perhaps more properly speaking, a question of mixed law and fact. Upon the facts stated in the complaint admitted and not explained, we find no difficulty in holding that the defendant's failure to obey the order of the Fire Commissioner was both culpable and negligent.

The defendant argues that the reference in Section 761 to the punishment provided by law for the crime of arson indicates that an action for damages under that Section will not lie unless the person sought to be charged has been guilty of the crime of arson. It is manifest that this could not have been the intention of the Legislature. What fixes the civil liability is negligence as well as criminal intent or design. But mere negligence, even if culpable and wilful is not sufficient to establish the crime of arson, of which an indispensable ingredient is criminal intent. To construe the section, in this regard, as defendant would have us do, would be to emasculate it.

It is further insisted that the defendant cannot be held liable under the statute because it is not alleged that the fire started as a consequence of defendant's negligence, but merely that it spread for that reason. As we read the section it is not necessary that the fire should be started as a consequence of negligence. The word used in the section is "resulting," and it is clearly alleged that the spread of the fire, and its communication to adjacent buildings resulted from the defendant's negligence. This we think satisfies the language of the statute and is clearly within its intention. We are therefore of opinion that the complaint sufficiently states a cause of action.

It follows that the order appealed from must be reversed with $10 costs and disbursements and the demurrer overruled with $10 costs, with leave to the defendant to withdraw its demurrer and answer within twenty days upon payment of costs in this court and the court below.—All concur.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Industrial Commissioner of Iowa Advocates Exclusive State Administration of Workmen's Compensation Insurance.—The Industrial Commissioner of Iowa, Mr. Warren Garst, while in New York this week attending the Convention of Insurance Commissioners, gave to the New York "Globe and Commercial Advertiser" an interview, in which he set forth his opinion that the administration of workmen's compensation insurance in each State should be wholly under the control of the State and that the private liability insurance companies should be completely excluded from participation in it. He would, further, have all the costs of administration borne by the State, leaving employers to bear merely the pure cost of the insurance. The essential portions of the interview are as follows:

"Compensation is a tax and should be regarded as such. The insurance fund should be created by premiums paid by the insured employers. The expenses of administering this insurance should be paid by the State at large. The State workmen's compensation relieves the courts of the trial of damage accidents, and thus saves the taxpayers thousands of dollars more than the expense of administering a State insurance fund can amount to. The payment of compensation saves thousands of families from becoming public charges, and again the State is saved expense in excess of the cost of administration. The entire State benefits—therefore the entire State should pay the cost.

"Perhaps that scares you. Perhaps it sounds too populistic for you. But I insist that this compensation is a tax. It must

FINANCE AND COMMERCE

Financial and Commercial Review
Banking Situation at Home and Abroad
Statistics of Cotton and Coffee
Market Prices of Securities and Commodities

NOW that the machinery of finance and trade has been almost restored a familiar development is being witnessed. Most persons are more than satisfied with the re-establishment of conditions conducive to a recovery of volumes and values, but a note of discord with the general contentment is struck by the usual number of post mortem grumblers who are persuaded that almost everything which has been done since the outbreak of the war should not have been done and nothing was done which should have been done and there is no health in us. For a reason no doubt the banking and business community will have to put up with the objectors who can make a good deal of noise when they try. Nor would it be surprising if President Wilson, despite his desire to prevent the business peace of mind from being disturbed by political manifestations, has trouble in keeping Congress from running amuck with investigations into the financial and business conduct of the war crisis with a view to shaping legislation accordingly.

Already Southern members of the National Legislature have begun to make a predictable howl about the opening of the cotton exchanges. No matter what the country as a whole has learned about the value of the organized apparatus of commerce and finance and the indispensability of the commodity and stock exchanges, the fact that cotton prices have not risen, but have gone down since the reopening of the regular markets is construed as proof that all the demagogic charges about speculation in futures is true. There will be more of this kind of thing, although it is a question now if clamorous radicalism is going to get a large following from a public which has had a good deal of schooling in the stern adversities which the European War has caused.

The cotton exchanges are far from being the only text of criticism and pestiferous comment. With the reopening of the stock exchanges we are beginning to hear that there never was any good reason why they should have closed. Something of the sort was said by bankers at the beginning of August, before finance and business realized how stupendous was the emergency precipitated by the European conflict, but it is worth noting that banking objection to the closing of the stock exchanges was not accompanied by any ideas as to how to go about reopening them at an early date.

The facts are, of course, that the suspension of the regular securities markets all over the world saved civilization from a panic, the colossal proportions of which cannot be comprehended. The shutting down of the machinery of the capital markets furnished needed leeway for the bolstering up of the credit markets and gained time for the repairing of the shattered economic machinery generally. It also produced an area of inaction and permitted an interval of reflection in which people everywhere had a chance to regain their wits and proceed to accustom themselves to the facts of the war and adjust their perspectives to it. How much all this was worth is shown by the circumstances under which the securities markets are reopening. Not so very long ago it appeared that Wall Street, like other financial centres, had on its hands a suspended panic ready to break out violently as soon as the embargoes on its expression were removed. It is now seen that the panic was rather suppressed than suspended, for there are no signs anywhere that a panicky state of mind exists.

Other financial developments are coming in for their share of unfavorable discussion. The banks, for example, are accused of having practiced a foolish gold hoarding in August and the early part of September, which spread dismay among depositors and helped to make the financial situation worse and so accelerated the contraction and depression of general business. The truth about this, as in regard to the other aspects of the commencement of the war, is that finance had no way of estimating promptly the dimensions of the economic catastrophe which might be impending, and it was certainly the part of wisdom for our bankers operating under statutory reserve requirements to hold fast to the reserve basis of credits. The Federal Reserve Banking System was still a matter of the future; and the one thing which was shown about gold was that every country in the world was grabbing at our supply. After a while effective co-operation was arranged, not only in the domestic banking community, but among international bankers, and a prudent release of gold for export purposes restored our international credit. The one important influence in promoting a return of comparative public composure at home was the taking of early steps to keep the gold foundations of our banking and currency system strong.

There is much debate also about the emergency measures resorted to in the issuance of clearing house certificates and emergency currency. Of these it is being said that both were overdone, although no particular difficulty is being experienced in undoing them. It is argued further than as long as emergency currency was going to be circulated in volume, the use of clearing house certificates could have been avoided because the clearing houses readily arranged to accept the extra circulation in settlement of balances. In answer to all this it can be pointed out that the crisis which loomed up in the banking prospect was huge. There were no precedents which could be consulted as adequate for dealing with it and there was no way of telling what was going to happen. It was highly desirable to spare no pains to cope with formidable runs which depositors might make on the banks, and it was more than desirable to safeguard bank reserves by provisions for converting deposits into acceptable forms of cash. It is fortunate that people in the main kept their heads as well as they did, but one reason why they did so is now to be the unmistakable over-preparation of finance to handle all possible contingencies. Excessive preparation against the chance of trouble has proved again to be the surest way of averting it.

As if the foregoing did not represent enough belated criticism fault is being found with the authorities for keeping the stock exchanges closed as long as they did, and with the methods instituted to safeguard security values and financial positions after the resumption of open business in the organized markets. With regard to these contentions the wisdom of keeping the stock exchanges so long in a state of suspension is demonstrated by the lack of any portents of serious disturbance attending their reopening. As for the restritcions on trading in securities, the only objection which has any symptom of validity is based on the theoretical arguments against any attempts at valorization, such as is implied by fixing minimum prices below which transactions will not be authorized in the open. This objection borrows from experience with the futility of efforts to valorize commodities, but the analogy is defective. Securities are only technically consumed through market processes. Actually they are imperishable and this quality presumes a long range intrinsic value which it is proper to recognize in figuring market value.

No, there is no sufficient ground for dissatisfaction with what has been done in the world of finance in the last few months. On the contrary, there is good ground for satisfaction with the con-

tributions which have been made to a recovery of the economic equilibrium. Indeed as one surveys the immediate situation as it exists in our own country he must find some encouragement for a fairly hopeful view of the outlook for some betterment of volumes and values. Probably values should receive the preference because it is logical that Wall Street, for instance, should be the first department in which activity has been suspended to make a return to its wonted activities. The return has been going on for some time and the opening of the Stock Exchange doors to trading in stocks as this week ended was only the outward completion of progress.

Until the organized securities market was restored and until it is shown what degree of permanence attaches to the restoration, and what the course of values will be, it could not and it cannot be said that the country is ready to go ahead to do better business in general trade and industry. There is entire fitness in contemplating the Wall Street resumption as marking the probable beginning of all around business improvement, because the discounting function of the securities market extends to such a momentous matter as the reopening of the Stock Exchange after a suspension of unprecedented duration. Financial activities are at the bottom of all forward movements in commerce, and manufacture and trade follows investment endeavors and tendencies.

So far as the war goes there have been no events calculated to check efforts to promote either the growth of business confidence or the expansion of the business movement. Although the tide of war has not distinctly set in favor of the Allies, Germany seems less and less likely to be able to wage a prolonged conflict. Aside from the war the greatest difficulty which business men and bankers have to contend with is that denoted by the factor of domestic politics.

President Wilson, in his annual message, held out assurances to the managers of business affairs that the programme of important legislation in the business domain was completed and gave a clear indication that the Executive was full of solicitude for business concerns. However this may be, business men are as yet far from being trustful of political intentions. They have no confidence in the practical intelligence of the party which has charge of things at Washington, and they remember that Mr. Wilson is not all there is to an Administration, which includes Mr. Bryan as Secretary of State and lesser Bryanites in places of lesser importance. The business world believes that the Federal Banking System has removed the money market from the field of apprehension, but they are wondering how the new banking experiment is going to work with the Secretary of the Treasury trying to take it over and make a Treasury enterprise of it. They are also wondering how the other political experiments which are being conducted, such as the low tariff and the commission government of interstate industry, are going to result. BROAD STREET.

COTTON

December 12, 1914.

THE event of the week in the cotton markets was the publication, on Thursday, of the estimate of the season's yield of lint cotton in the United States, as made up by the Crop Reporting Board of the Bureau of Crop Estimates of the United States Department of Agriculture. This report is given in detail in another column of this paper. Despite the fact that the cotton trade has long realized that this year's crop is a very large one, the figure issued,— 15,966,000 bales of 500 pounds, gross weight,—took the markets decidedly by surprise. In no previous year has anywhere near so large a cotton crop been indicated by the Department of Agriculture's December estimate. Even the Department itself but recently, as stated in this paper last week, prognosticated, on the basis of its September condition report, a yield of only 15,360,000 bales. Inasmuch as the present estimate does not include linters, which can scarcely fall below 650,000 in a crop of such magnitude, it must be assumed that the commercial crop of 1914-1915, if it had moved out in normal fashion, would have been not far from 16,600,000 bales, or half a million bales more than the next largest crop (1911-1912) of 16,100,000 bales. Under the existing abnormal conditions it is, of course, a matter of pure guess-work to forecast the size of the commercial crop this season. It is not even certain that the total production, as indicated by the Department of Agriculture, will be picked and ginned; and the final ginning figure may turn out to be some hundreds of thousands of bales smaller than the estimated production. More important than this, however, as a factor with regard to the size of the commercial crop, is the extreme improbability that the farmers will sell or the markets buy any such quantity of cotton. It is now imperative, from the point of view of pure self-preservation, that the farmers should treat a large part of the cotton they have grown in 1914 as in reality part of their crop for 1915. A motive more powerful than all the laws that could be enacted, has now been evoked in favor of the severest kind of reduction of the cotton acreage for the coming year, and the farmers will find that they have little choice about the matter. If they sell their cotton freely now, the price will decline to so low a level as to make cotton production clearly ruinous for the next season; while if they hold over a third of their crop, it will be apparent even to themselves that a crop of normal size next year, conjoined with the carry-over, can be sold only so far below the cost of production as to leave them all financially prostrate. Whether they will or not, then, they must turn to grain and other crops, by means of which they can at least live, even though the remuneration is less attractive than they have of late become accustomed to. What is now imperative is that the two crops of 1914-1915 and 1915-1916, taken together, should not exceed 25,000,000 to 26,000,000 bales. To bring this about a minimum reduction of 33⅓ per cent in the acreage in cotton will be required. A reduction of 40 per cent would be better still. This exceeds any acreage reduction ever known in the history of cotton; and yet, under the pressure of self-interest on the part of the farmers themselves, and of curtailment of credit on the part of merchants and bankers to such farmers as prove obstinate, there is no reason to despair of the attainment of the desired result. It would seem, moreover, that this is the view of the matter generally entertained by the cotton trade; at least the action of the markets, after the announcement of the Department of Agriculture's estimate of yield, would so indicate. Had there been no war, no tie-up of exports, no curtailment of consumption, and the ordinary amount of trading in the futures markets, the extreme bearishness of this announcement would unquestionably have led to a violent break in the price of cotton. One cent a pound decline at the very least, could have been counted upon. As it was, however, the decline on Thursday and again yesterday was of very moderate proportions and still left the market level materially higher than it was at the point of the season of 1904-1905. It may well be that some further decline is on the cards, and that the farmers will yet have to sell, if they do sell, at no better prices than they obtained in that first of recent large crop seasons. The trade, however, does not anticipate this and is not counting upon it. On the contrary, the trade is of the opinion that the necessary reduction in acreage will be made and that the expectancy of the coming crop of 1915-1916 will be small enough to justify prices quite as high, and probably much higher than those now ruling. It will proceed on this basis as long as it can; but it is an assured fact that the faintest suspicion on the part of the trade that the expected reduction in acreage is not to be realized, will instantly lead to the abandonment of all commitments in cotton on the long side. Merchants, manufacturers and speculators will unanimously abandon the hope of higher prices for years to come, and the South will see its prized and lauded crop, being held to be substantially the same as gold itself, despised and rejected by all. The damage will then be repaired only after there have gradually been developed new uses for cotton which will remove the superabundance of it from the markets. It is devoutly to be wished, for the sake both of the Southern agricultural community and of the country as a whole, that no mistake be made in the matter.

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	445,369	384,535	293,661	372,651
Overland to mills and Canada	49,957	50,735	59,738	30,265
So. mill takings, est., exclusive of takings from Southern ports.	100,000	100,000	105,000	90,000
Gain of stocks at interior towns	43,080	32,077	43,362	44,621
Brought into sight for week	638,406	567,347	501,761	537,537
Total Movement—				
Port receipts	6,599,316	6,526,303	6,274,373	3,472,240
Overland to mills and Canada	396,902	438,194	507,653	332,586
Southern mill takings	1,232,032	1,205,873	1,264,796	847,887
Stocks at interior towns in excess of Sept. 1	760,397	613,407	682,360	1,009,881
Brought into sight thus far this season	8,988,647	8,732,777	8,729,182	5,662,594

The total crop movement is respectively for 137 days, 135 days, 134 days and 133 days.

SIXTH COTTON GINNING REPORT OF THE SEASON.

On Tuesday, December 8, the Bureau of the Census issued its sixth report of the season on cotton ginned from the American crop of 1914-1915. The figures cover the period from the beginning of the season up to December 1. The following table gives the returns by States, with comparisons for last year and for the large crop year, 1911:

COTTON GINNED FOR SEASON TO DECEMBER 1.

	1911, Bales.	1913, Bales.	1914, Bales.
Alabama	1,436,076	1,365,246	1,438,389
Arkansas	680,434	789,937	840,562
Florida	74,056	58,485	72,859
Georgia	2,339,354	2,066,109	2,285,607
Louisiana	313,624	342,383	381,913
Mississippi	892,495	955,808	986,998
North Carolina	828,660	622,369	674,135
Oklahoma	783,989	764,295	1,018,287
South Carolina	1,310,963	1,160,725	1,225,467
Tennessee	319,979	304,467	291,329
Texas	3,747,932	3,572,105	3,746,694
All others	89,245	86,483	103,865
United States	12,816,807	12,088,412	13,066,105

The amount of cotton ginned from November 14 to December 1 was 1,394,895 bales, as compared with 1,503,571 bales ginned in the same period in the season of 1911-1912, or 109,000 bales less. It must be borne in mind that the weather during the last ginning period was extremely unfavorable. Included in the figures for this year were 36,195 round bales (taken as half-bales), as compared with 86,878 last year, 73,030 in 1912, and 87,567 in 1911. Sea Island cotton included amounted to 62,991 bales, compared with 61,049 bales last year, 51,275 bales in 1912, and 87,457 bales in 1911.

The average quantity of cotton ginned prior to December 1 in the last seven years was 10,732,631 bales, or 84.6 per cent of the average of the seven crops.

DEPARTMENT OF AGRICULTURE'S FINAL COTTON CROP ESTIMATE FOR 1914-1915.

The Crop Reporting Board of the Bureau of Crop Estimates of the United States Department of Agriculture estimates, from the reports of the correspondents and agents of the Bureau, that the total production of cotton in the United States for the season 1914-1915 will amount to 7,637,113,000 pounds (not including linters), estimated production, with comparisons, by States, follows:

equivalent to 15,966,000 bales of 500 pounds, gross weight. The

States.	Lbs. Lint. 1914.	Bales of 500 Lbs., Gross Weight. 1914.	1913 (Census).	5-Year Av. 1908-1912 (Census).
Virginia	11,443,000	24,000	23,490	18,305
North Carolina	452,865,000	950,000	792,545	779,037
South Carolina	716,100,000	1,500,000	1,377,814	1,252,981
Georgia	1,266,435,000	2,650,000	2,316,601	2,000,514
Florida	36,075,000	75,000	58,695	62,239
Alabama	803,158,000	1,600,000	1,495,485	1,324,624
Mississippi	610,470,000	1,275,000	1,310,743	1,200,361
Louisiana	220,064,000	460,000	443,821	345,973
Texas	2,184,240,000	4,560,000	3,944,970	3,704,668
Arkansas	497,848,000	1,040,000	1,072,846	850,793
Tennessee	174,726,000	365,000	379,471	329,860
Missouri	35,932,000	75,000	67,105	63,836
Oklahoma	597,875,000	1,250,000	840,387	840,422
California	17,708,000	37,000	22,838	.....
All other	7,174,000	15,000	9,675	8,670
United States	7,637,113,000	15,966,000	14,156,486	12,850,297

Total production was 13,703,421 bales (500 pounds gross) in 1912; 15,692,701 in 1911; 11,608,616 in 1910; 10,004,949 in 1909; 13,241,799 in 1908.

The price per pound to producers December 1 in 1912 was 11.9 cents; 8.8 cents in 1911; 14.2 cents in 1910; 13.9 cents in 1909; 8.7 cents in 1908.

* * *

Liverpool Cotton Trade Financially Sound.—"It must be a great source of gratification to the directors of the Liverpool Cotton Association," says the "Liverpool Post," "to find that their strenuous and unremitting labors on behalf of the members have been crowned with absolute success, and that to-day's cash settlement down to present levels was met without a hitch. The price of May-June (1915) on the 27th of July, the last settlement prior to the outbreak of the war, was 6.54½d., and on Monday last the same position was struck at 4.18d., a fall of 236½ points, or £473 sterling, per 100 bales in actual cash. During the Fall over two and a half million pounds has been paid by the members of the Association to meet differences on their own and clients' account; and it is something to be proud of, when we remember that not only has not one failure occurred, but that not one firm has found it necessary to take advantage of the Government scheme, inaugurated for the purpose of assisting any one who might be temporarily financially embarrassed. No further words need be used to exemplify the sound and stable condition of the cotton trade, as represented in Liverpool at all events."

NEW YORK QUOTATIONS FOR STANDARD COTTON GOODS AND YARNS

The following are quoted prices in the New York market for typical standard cotton goods (in cents per yard) and cotton yarns (in cents per pound) on Saturday of last week and on Wednesday of the present week:

Cloths.	Saturday.	Wednesday.
Print cloths, 28-in. 64 x 64s	3	2⅞
Gray goods, 38½-in., standard	4	3⅞-4
Brown sheetings, Southern standard	6¼-6½	6¼-6½
Denims, 9 ounce	12½-16	12½-16
Tickings, 8 ounce	12½	12½
Standard prints	5	5¼
Standard staple ginghams	6	6
Yarns.		
Southern 2-ply skeins, 30s	18-18½	18-18½
Southern 2-ply skeins, 60s	32	32
Southern single skeins, 20s	13	13
Southern single chain warps, 22s	14½	14½
Southern 2-ply chain warps, 20s	16	16
Southern frame cones, 20s	16½-17	16½-17
Southern frame cones, 30s	18½-19	18½-19
Eastern carded cops, 20s	18	18
Eastern carded cops, 30s	20	20
Eastern carded peeler warps, 30s	24½	24½
Eastern carded peeler warps, 56s	40	40

Money Circulation in the United States, December 1, 1914.—The Treasury Department's monthly statement of the money in circulation on December 1, 1914, shows a total of approximately $3,630,000,000, as against $3,715,000,000 on November 2, 1914. The general stock of money in the country is placed at $4,031,000,000 on December 1, as against $4,055,000,000 on November 2. Money held in the Treasury as assets of the Government amounted to $401,000,000 on December 1, as against $339,000,000 on November 2. On the basis of population estimated at 99,733,000 the circulation per capita is given as $36.40. The following tables show the amounts of the various kinds of money in circulation and the general stock of money on November 2, 1914, as compared with the status at other dates:

Fertilizer Resources of the United States.—The Bureau of Soils, of the United States Department of Agriculture, has submitted its annual report for the fiscal year ended June 30, 1914. In discussing the fertilizer resources of the United States, the report says, in part:

While the extraction of potash from such natural silicates as the feldspars is quite feasible physically, it is not practicable economically, unless some other salable product is produced in the same operation. An investigation into the use of feldspar in the fixation of atmospheric nitrogen showed promise of a practical method of producing ammonia simultaneously with potash from feldspar. The most promising American source of potash, however, is the annual crop of giant kelps on the Pacific Coast. Working maps have now been made of nearly all the commercially available kelp beds from the Cedros Islands to the Shumagins, off the Alaskan Coast. The area of these beds aggregates nearly 400 square miles, capable of yielding annually, either as dried kelp or as pure potassium chloride, over six times the present consumption of soluble potash salts in the United States, or something more than the world's present total production. The development of a great American industry, based on the conservation and utilization of this important national resource, of fundamental importance to the national agricultural interests, seems now to be a matter of time only.

If all the coal that is now coked in the United States were treated in modern by-product ovens and the ammonia thereby saved, the nitrogen tonnage would be about that now consumed in the fertilizer trade of the country. While the transition from the old "beehive" to the modern furnace method is steadily progressing, the greater dependence for nitrogen carriers yet remains in cottonseed meal, slaughterhouse by-products, fish scrap, and some other less important materials. The growing and insistent demand for more nitrogeneous feeds to support the meat production demanded by the dietary customs of the American people is gradually but steadily withdrawing these "organic" carriers from the command of the fertilizer manufacturers, while the demand for nitrogen carriers is steadily increasing. The necessity for artificial methods of fixation of atmospheric nitrogen in the United States is not immediately present, but is approaching rapidly. It would be premature to anonunce the results of the department's investigations as yet, but the types of material which are of commercial promise for American conditions have been pretty well worked out and substantial progress has been made in the investigation of the fundamental technical factors which must control the production of these particular types. At the same time investigation is being made of other possible sources of nitrogen. Following up previous investigation of the possibilities in the fish-scrap industry of the Atlantic Coast, already devolved, a study has been made of the possibilities on the Pacific Coats, including Alaska. The waste fish and fish refuse approximate annually 120,000 tons and can be made to yield about 12,000 tons of scrap (fertilizer) and 3,000,000 gallons of oil, worth, perhaps, $1,800,000. A study is also now under way of the possibilities under American conditions of utilizing garbage and other city wastes.

Although improvements are being made the wastage of phosphate rock at the mines is still disconcertingly large. In Florida, where the most actively worked fields are situated, investigations of the Bureau of Soils have shown that practically two pounds of phosphorus goes to waste for every pound produced in merchantable rock. Studies are now being made looking to the recovery or prevention of some of this wastage by mechanical methods, while several chemical methods have been carefully investigated. One of the latter is a modification of the well-known sulphuric-acid extraction, but by "steps." Extraction by electrolysis has been shown to be economically impracticable, but the use of the electric current to produce temperatures necessary for volatilization methods appears very promising, and at least two such mehods are now being subjected to factory trials by outside commercial organizations.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

(Continued from Page 756.)

either be paid by the citizens as a tax or it will be paid by them unknowingly in the conduct of their courts and care of injured. If they pay it in the form of taxes they will find it decidedly cheaper than paying it to a private corporation which is in the insurance business to make money, and then paying it over again to run the courts and poorhouses.

"There is some cry against 'State insurance.' This is not State insurance, strictly speaking. The State simply collects a fund from the insured and furnishes the cost of administering that fund. That is not State insurance. The State is not engaging in the insurance business. No element of profit appears. It is the administration of workmen's compensation insurance from the primary standpoint of the State and its working people rather than that of corporations organized for pecuniary profit.

"Private or stock company insurance means that all the men whose hair is turning gray, every man who is unable to work without glasses, every man who is partly incapacitated as the result of some old accident, will be crowded out of the ranks of industry. There are thousands of men to-day with one eye, with one arm, or with one leg who are self-supporting, and many of them caring for their families. But the private or stock insurance company is there to make profits. It will refuse a risk on these men, except at a prohibitive rate. Consequently employers will get rid of them. The man who is at the top of the hill of life and has to wear glasses to see his way down must go. There is no risk about insuring old men.

"I do not consider it good public policy to make this great number of men idle. We have probably 10,000 men in Iowa who are partly incapacitated, but they are all working and earning their living—even supporting families in whole or in part. I do not consider it good public policy for the State of Iowa to let these men become idle because some corporation wants dividends. I consider it good public policy for the State to administer workmen's compensation insurance in such a way that these men will be protected and not become objects of charity—a heavy tax on the citizens of our State."

The chief interest of the above expressions of opinion of Commissioner Garfield is in his assertion that workmen's compensation is in its infancy. The earlier advocates of the system in the United States looked upon it as a sort of [illegible] industrial peace [illegible] employers and employed. The [illegible] should be [illegible] Mr. Garfield [illegible] within [illegible] choice of definition. A "[illegible]" and the application [illegible] practically [illegible] of all the premiums [illegible] [illegible] [illegible]

map by defeating a full-crew bill, and when the long-suffering people of Wisconsin will deliberately repudiate the crowning and final product of the culture oven in which, in the name of progress, every kind of socialistic fad and fancy has been germinated in the past two decades, we, who believe in the policy of making haste slowly, can find some comfort.

"It would be most unfortunate, to my mind, if the initiative of private enterprise were ever taken out of life insurance by having the State assume it. There seems to be record enough of the failure, or non-progress, of State-owned or State-operated life insurance enterprises to keep us from repeating the experiment. To succeed, the State would need a monopoly of the business and, in addition, a law making insurance compulsory. I regard the happening of these two contingencies as quite unlikely in this country, and, unless prohibited from competing with State insurance or deliberately crippled by law in so doing, the companies will have nothing to fear. Hence, I look for an indefinite continuance of the present status, where the Government, through the agencies of the law and the departments, demands and compels solvency, honest management, equitable dealings—and I express the hope that the relation between the departments and the companies will be such as to secure, with a minimum of friction, a maximum of efficiency for the people they serve."

INSURANCE NEWS IN THE WEST

Reinsurance of the Individual Fire Underwriters of St. Louis.—After a career of twelve years the Individual Fire Underwriters of St. Louis has decided to quit. The advisory committee came to this conclusion this week. The premium income was not satisfactory and the future of the business was not encouraging. This institution is a high-grade, well-managed Lloyds. Each of its twenty-five underwriters put up $10,000 as a deposit and was liable for three times that much in addition. The management is in the hands of W. H. Markham & Co., fire agents, who rank with the best. It paid brokers only 10 or 15 per cent commissions, according to the class of business. Its business consisted largely of reinsurance. Its premium income for 1913 was less than $43,000, and, as the prospects of growth in the future were not bright, it was decided to reinsure and discontinue.

* * *

Compensation Revisions and Amendments in the West.—Now are coming to the fore all sorts of demands for amendments or revision of many of the workmen's compensation laws of the West. Some of these were to be expected. For example, it was not likely that the working men of the Western States would be satisfied with 50 per cent of wages as a basis of compensation, when the laws of several States make 65 or 66⅔ the basis. Accordingly organized labor in Nebraska already is asking the increase in the scale, although the law has actually been in effect less than two weeks. In Minnesota also there is a demand for an increase in compensation.

The question of the administration of the compensation laws appears also to be coming to the front to some extent. The Minnesota workmen want the Labor Commissioner, instead of the courts, to handle disputes. The Labor Commissioner of Kansas will ask for the creation of a new bureau in the Department of Labor to be known as the Commissioner of Compensation, who will arbitrate disputes and see that injured workmen get their rights. Commissioner O'Brien states that damage case lawyers are getting large percentages of amounts awarded workmen and that unconscionable lump sum settlements are being made. In Oklahoma the labor men and the manufacturers are each charging the other with the failure of the State to have a compensation law now. The labor men say that the manufacturers defeated the bill two years ago. The manufacturers admit this and intimate that they will endeavor to do the same thing again if the labor element insists upon a law providing for life pensions and administered by the Labor Department. The manufacturers favored a different bill, providing for administration by the Insurance Department, and they charge the labor people with defeating that measure.

A committee of employers and employes, with the assistance of the Industrial Board and Samuel A. Harper, the attorney who drafted the first Illinois compensation law, is now engaged in drafting a bill to revise the present law and remove flaws discovered in operating under it. A member of the incoming State Senate is reported as redrafting the Minnesota law. A well-informed State official in Iowa says that efforts will certainly be made to amend the law of that State. The Texas Industrial Commission has recommended a number of changes in the act of that State. There is little question that extensive amendments to the Oiho law will be sought.

* * *

Movement for Compulsory Contractors' Bond Law for Michigan.—Two or three important organizations in Michigan have got behind a move to secure the enactment in that State of a law to require all contractors to give bonds except where the contract amounts to less than $2,000. While the surety people favor this, they did not initiate the movement. It started with those who would protect owners from the effects of the mechanics' and materialmen's lien law of the State by either putting irresponsible contractors out of business through their inability to furnish bonds or throw the burden of paying the unpaid debts of such contractors upon those unwise enough to become their sureties.

* * *

Compensation Mutuals in Nebraska.—With the filing of articles of incorporation by two mutuals that purpose to write workmen's compensation in Nebraska, the question of rates in that State becomes interesting. These institutions have backing sufficient to give promise of their becoming important factors. It has been reported that they intend to discount stock company rates 20 or 25 per cent, but this is probably hearsay, as the law under which they are organizing gives the Insurance Commissioner supervision of their rates. He has not stated what he will do positively, as he has not yet conferred with the officers of the mutuals, but he is reported to look with favor upon the plan of requiring the mutuals at first to secure rates known to be adequate and then let them pay dividends or reduce the rates later if experience warrants such action. In short, the Massachusetts kind of rate supervision appeals to him, according to report.

* * *

Controversy over Indiana Steam Boiler Law.—The Indiana steam boiler law which was enacted in 1913 has given rise to some controversy, and it appears likely efforts will be made to amend it this Winter. They will be strongly opposed. Indiana was one of the States very dilatory about protecting its citizens against the installation of substandard boilers, with the result that before 1913 low grade new boilers and discarded second-hand ones that no longer could be used in States having good laws, had been installed in Indiana in large numbers. Especially is this said to have been the case in the coal fields in the Southern part of the State. When Indiana finally did pass a boiler law, it passed a very strict one. It requires a higher factor of safety than Ohio, or Massachusetts, whose laws have been held up as models. The result is that owners of these low grade boilers have to use very low steam pressure, and many of them will have to buy new boilers or run in a limping,

unsatisfactory way. They want the factor of safety lowered. While it is so high as at present, they [illegible] kind of carrying steam boiler insurance and some of them are said to be dropping their insurance at expiration. This is unsatisfactory to the companies that lose this business, and one or two insurance companies are reported as standing with the steam users to get the standard changed to the new "uniform" one recommended by the American Society of Mechanical Engineers. On the other side, the boiler manufacturers get an advantage from the present law and do not want it changed. The representatives of labor and the safety organizations argue that when the State has a law which provides for a higher factor of safety than does that of any other State it would be bad policy to go back to lower standards.

* * *

Interesting Surety Situation at Fort Worth. An interesting situation has arisen at Fort Worth, Texas, where the Equitable Surety has been relieved by the Federal Court of liability under a $150,000 contract bond. The City of Fort Worth had entered into a contract for the building of a tunnel for its water works. Under its terms the contractor was bound to carry out his side, but the city retained the right to abrogate the contract at its pleasure. The court held that there was an absence of mutuality, that the contract was therefore void and that the surety could not be held to complete a void contract. It is said that most of Fort Worth's contracts for public improvements have been of this character. Attorneys for the city are making a hard fight, for the city might be placed in a bad position if the decision just given were allowed to stand in its present form.

Chicago, December 11, 1914. LA SALLE.

ITEMS OF INSURANCE NEWS.

The plan for the [illegible] of the Prudential Insurance Company of America was adopted [illegible] and brought virtually to realization through the [illegible] of the policyholders of the company at a meeting held at the [illegible], N. J., on Monday, December 7. The vote of the [illegible] is reported to have been overwhelmingly in favor of the plan. Proxies [illegible] were 4,010 in favor and only 206 opposed. [illegible] will show that over 650 votes [illegible] that the policyholders have approved [illegible] permitted by the enabling statute to pass [illegible] will then appoint three trustees who will [illegible] company the stock outstanding at the [illegible] value.

At the [illegible] Daily Underwriter, Insurance [illegible] Magazine and Insurance Monitor, of London, Sir G. Sherston Baker gave his decision in a case in which a fisherman claimed compensation from the owners of the trawler Kilmarnock for injuries caused by the trawler being blown up by a German mine in the North Sea. His Honor refused to allow the claim, on the ground that injuries inflicted by the enemy do not come under the Workmen's Compensation Acts. He expressed the hope that the case would be taken to the Court of Appeal.

Mr. F. W. Thomson, President of the Farm Mortgage Bankers' Association of America, Chicago, is reported as stating that a few of the life insurance companies that withdrew from the farm loan field during the early days of August are back again making loans, though not as freely as they formerly did. It is the general belief among dealers in farm mortgages that most of them will be back in the field after the first of the year. The situation now seems to be clearing up quite perceptibly and a return to farm mortgages as a source of sound investment is to be expected.

Superintendent Hasbrouck, of the New York Insurance Department, has made the following answers to inquiries on the subject of the Federal War Revenue Tax received by him:

November 30, 1914.

Mr. A. C. Hegeman, President, Fire Brokers' Association of the City of New York:

Dear Sir:—Replying to your favor of the 30th inst., you are advised that the department is of the opinion that the payment by agents or brokers of charges made by fire insurance companies against policyholders covering the war revenue stamp tax would constitute a rebate within the intent and meaning of section 65 of the insurance law. A rebate is defined by said section to be not only a technical "rebate from the premium," but also "any special favor or charge * * * or any valuable consideration or inducement whatever, not specified in the policy or contract of insurance * * * or anything of value whatsoever, not specified in the policy." Respectfully yours,

FRANK HASBROUCK, Superintendent of Insurance.

November 30, 1914.

Mr. A. C. Hegeman, President, Fire Brokers' Association of the City of New York:

Dear Sir:—We are in receipt of your favor of the 30th inst. on the subject of the war revenue stamp tax on insurance policies. We note your conclusions with regard to the probable disturbance which will ensue by reason of the attempt of the fire insurance companies to collect from the assured the amount of the tax levied by the Federal tax law, effective as of to-morrow.

The department is quite clearly of the opinion that the revenue act requires the stamp to be affixed and cancelled by the corporation issuing the policy, the tax falling upon the corporation. We have further recognized, however, that by virtue of the authority set forth in section 146 of the Insurance Law, fire insurance companies are permitted to make a charge for "a policy fee, survey fee, or other fees or charge in addition to the consideration or premium written in the policy." Presumably, it is this section of the law under which fire insurance companies are seeking to impose upon policyholders of New York State the burden of assuming the payment of the war revenue tax. Your opinion that section 144 of the Insurance Law appears to prohibit a charge of this character we do not concur in, the section merely reciting that it is not lawful for an insurer knowingly to include as part of the premium "any fee, compensation, charge or prerequisite whatsoever." Respectfully yours,

FRANK HASBROUCK, Superintendent of Insurance.

The meeting of the National Convention of Insurance Commissioners, held in New York on December 7, 8 and 9, performed some important work in the consideration of insurance supervision problems. The chief [illegible] were the endorsement of Commissioner Ekern's [illegible] supervision bills, which have been so [illegible] the passage of the adverse resolution against underwriting [illegible] and the favorable action of the [illegible] enactment of the New [illegible] law and the broadening of the scope of [illegible] powers.

Governmental Interference with a Great Business and Some of its Costs

A CONSIDERABLE sub-division of the recently issued report of the Secretary of Agriculture is devoted to the Cotton Futures Act, more commonly known as the Lever Act, which was adopted by Congress in August last and which is to go into operation on February 18, 1915. The introductory paragraph of the Secretary's remarks upon this subject is as follows:

"The Cotton Futures Act is the first definite, systematic, legal approach to the solution of difficult problems in this field of distribution. Interest in the economics of the cotton situation has grown rapidly in recent years, and has been especially marked during the present season because of the difficulties arising out of the European War. For many years there has been a growing dissatisfaction with the future markets as a means of price insurance. The demand for reform in certain practices and methods of the exchanges resulted in the passage of the futures act, which is designed to increase the safety of the future contract as an insurance and to limit somewhat the possibility of manipulation."

It is clear from the very first sentence of this statement that Secretary Houston, like the members of his party generally in Congress and in the Administration, conceives that the National Government alone is capable to solving the difficult problem of distributing the cotton crop of the United States. For over a century now cotton has been grown in this country and its distribution has somehow been accomplished by that class of persons known as cotton merchants. The annual crops of cotton have grown and grown; the money values involved in them have increased by leaps and bounds; the cotton consuming countries all over the world have become steadily more numerous and more remote; the credit operations necessary in getting American cotton to these consuming countries have grown vastly in extent and complexity, without any sign of inability on the part of cotton merchants to meet their requirements; but the "difficult problems in this field of distribution" have remained unsolved, and it is only at this moment that "the first definite, systematic, legal approach" to their solution is made, through the interposition of the National Legislature. This is certainly a noteworthy state of things.

The French have a saying that: "*Tout se paie*, a price must be paid for everything." It is not to be expected that some price will not have to be paid for the revolution in the conception of the true source of health and justice in our economic life with which the Democratic Administration and the Democratic Congress have identified themselves during the past two years. Until the Democratic régime began, it had been generally believed by Americans that, if a reasonable competition could be maintained, the difficult problems of any great department of business would naturally solve themselves through the action and counteraction of the forces of economic activity, the play and counterplay of minds actuated by enlightened self-interest in the pursuit of a livelihood, the gradual discovery and acceptance of methods and practices fair to all. It has, however, been one of the continual puzzles in connection with the political party presently in power that while its leaders have never ceased to exalt in speech the traditional free-

dom of competition, as the greatest of all solvers of problems, the tendency of all its important acts has been to find checks and restrictions for free competition, to belittle its results in producing equity among citizens, and to substitute for it, to as large an extent as possible, that governmental determination of the principles and rules which must be followed in the conduct of affairs, held by our forefathers to be one of the most odious forms of tyranny. And to this new order of things, sought by the Democratic Party to be established in the United States, belongs *par excellence* the Cotton Futures Act, of which the Secretary of Agriculture writes that it "is the first definite, systematic, legal approach to the solution of difficult problems in this field of distribution." By it a totally new and untried system is to be imposed upon the cotton trade and, indeed, the entire cotton industry of the country; and a price must be paid for this, though no one now can foresee the full amount of the price.

It would seem to be self evident that if there is any excuse at all for Government to intervene with its all-powerful hand in the business affairs of citizens, it must be that Government has a more exact knowledge and a larger wisdom than groups of private persons, however numerous and experienced, can have. One would say off-hand, for instance, that a prime requisite of really beneficial regulation of the distribution of cotton by the Government and of governmental definition of the instrumentalities of that distribution, must be a precision of information upon the subject which the cotton trade has hitherto not displayed. Ignorance or uncertainty as to the nature and principles of the matter are not only indefensible, but preposterous, on the part of even a Government and its members or officers, when they assert the advantage to the body politic of having their conceptions and their will substituted for the experience and judgment, acquired by continually conforming to the apparent necessities of their vocation, of the members of such a business as the cotton business. And yet, one of the outstanding facts in connection with the new governmental regulation of the cotton trade, and especially of the cotton trade, is that the Government itself is wholly devoid of an established and consistent theory with regard to the very nature of what it is attempting more than all else to regulate, namely, those transactions upon cotton exchanges known as contracts for future delivery, or, in the unscientific vernacular of the Government, "cotton futures." In fact, the Government has flatly and violently contradicted [illegible] on the subject within the short space of five years.

Secretary Houston, in the extract quoted from his report, gives a typical [illegible] for the adoption of the Cotton Futures [illegible] consideration that "for many years there has been increasing dissatisfaction with the future market as a means of price insurance." But only five years [illegible] official, Mr. Herbert Knox Smith, Commissioner of Corporations, denounced in the strongest possible terms the theory that "cotton futures" [illegible] as being in common with insurance. [illegible] of Mr. Herbert Knox Smith's "Report on Cotton Exchanges" published on December 4, 1908, [illegible] observations on this subject.

Recently, however, a new definition of hedging, and one of an extraordinary ingenious character, has been advanced by some advocates of fixed differences. This new theory of hedging assumes that the hedge, instead of being intended to relieve the non-speculative class of risks, is virtually a means of effecting a distribution of risks among all parties to the future market, speculative and non-speculative, substantially similar to that which occurs in the case of a mutual fire insurance company.

"There is a fundamental error in this new theory of hedging. It is true that hedging is commonly referred to in the trade as a sort of insurance. It is by no means, however, a mutual insurance, and the word 'insurance' is not applicable in its technical sense. Ordinary insurance is based upon the prospect of loss or destruction of wealth. Insurance is indemnity for such loss. In the case of fluctuations in the value of a product like cotton, on the other hand, there is no destruction of wealth as a result of a decline in values; instead, a shrinkage in value which results in a loss to the seller means a corresponding benefit to the buyer."

We need not discuss this economic elucubration of the erstwhile Commissioner of Corporations, though it is worth remarking that there is much of comfort for the Southern cotton producer this year in the thought that the decline in the value of his crop implies no destruction of wealth, since somebody else gains what he loses. The main point is, however, that a pubication of the United States Government declared in 1909 that the definition of the use of hedging,—i. e. of cotton future contracts,—as insurance is "of an exceedingly fallacious character," while the Secretary of Agriculture in 1914 asserts that "a growing dissatisfaction with the future markets as a means of price insurance" has been the motive and justification for the enacting by Congress of legislation which removes from the class of cotton merchants the control of their business and hands this control over to the officers of the Government, under rules and regulations prescribed by Congress itself. And the very contradiction between Commissioner and Secretary is conclusive evidence that there is no sure governmental knowledge of the nature and necessities of the business of distributing cotton, at least in so far as "cotton futures" are concerned; but that the new legislation has been adopted and is to be put into effect as essentially a quack remedy for an undiagnosed and merely suspected disease.

It may be said that after all this confusion of governmental thinking and the consequent ineptitudes of the legislation which is designed to bring about a better order of things in the cotton business than the members of the cotton trade themselves have been able to attain, does not involve what may be called "costs." Though the Government bungle, the trade, it may be urged, can adapt itself to the bungling, as it adapts itself to the unfavorable vicissitudes of the weather or to the unexpected disturbances of the world's affairs; and one more hazard to be provided for, among so many as the cotton merchant has to face, need not bring with it a material increase of economic cost. Unfortunately, the matter is not so easy to dispose of. The very interposition of the Government, with its imperative yet ignorant regulations, must bring with it a long train of unseen and incalculable costs, in the shape of activities restricted, energies checked and diminished, courageous enterprise thwarted and held in bonds. When the Government comes in at the door, the free motion of the mind escapes by the window. The mere shadow of governmental

authority paralyzes initiative, lessens efficiency and decreases the sum-total of benefits which society derives from the thinking and working of any class or group of individuals within itself. Here are "costs," and heavy ones, to be paid for the Cotton Futures Act, whose praises are sung by Secretary Houston.

There are, however, more tangible and calculable "costs" which will have to be met, as a result of the legislation. In order to compass the ends which, in its economic ignorance, Congress thought to be essential and desirable, provisions have been incorporated in the Cotton Futures Act which will continually expose all persons producing cotton or dealing in it to the most serious losses. It is enough to enumerate but two or three of the "cost" effects of these provisions, and particularly such as directly affect the cotton producer, whose name has been so much in the mouths of the advocates of governmental control of the processes of distributing the cotton crop. Henceforth, so long as the Cotton Futures Act is in force, the cotton farmer who has the misfortune to have his still unpicked crop exposed to storms will have no calculable market whatever for his cotton. It will be of too low a grade to be bought and sold upon the cotton exchanges, and the unlucky farmer must take what price he can get for it, irrespective of its worth to the spinner who ultimately uses it. In at least two years out of the past ten, not less than five million bales of such cotton have had to be marketed, and with the aid of the cotton exchanges, reasonable prices have been obtained for it. But Congress, in order to attain an object of no economic consequence whatever to these or any other cotton producers, has smitten the already grievously burdened owners of storm-beaten cotton and insured that it shall sell enormously below its true worth. Similarly, large quantities of cotton are regularly produced in the South whose fibre is less than seven-eighths of an inch in length; and when the Atlantic States are visited with a severe drought in August and September the amount of such cotton is very greatly increased. This cotton, also, is deprived of a calculable market by the Cotton Futures Act. As the seasons revolve it will be found that the "cost" of this far-reaching governmental rule, whose aim is to force farmers, will they nill they, to raise the kinds of cotton governmentally approved of, will prove high indeed for the farmers who suffer from it. And so we might continue both in the field of cotton production and in that of distribution; everywhere we should find indefensible governmental compulsion, heedlessly working "cost" effects which unfortunate individuals must bear. And through it all runs ignorance, the crass ignorance of men who have power and mean to use it, but who are incompetent and destructive, as governments and their officials must always be, when they undertake to interfere with the practical conduct of business affairs.

Arthur Richmond Marsh

THE COTTON LOAN FUND AS THE REDUCTIO AD ABSURDUM OF BANKING ASSISTANCE

IT is unnecessary to recite here all that has been said and done during the past two or three months in connection with the provision of a fund of $135,000,000, to be loaned for the purpose of carrying the surplus of the present great cotton crop over the period of the European War, until the return of peace and the resumption of full consumption may enable the cotton to be sold at a reasonably remunerative price. From its very inception the plan has received a large amount of public attention and the public-spirited efforts of those engaged in promoting it have been duly recorded in the newspapers. There is no doubt that an enormous amount of time and energy has been expended upon the matter, both by the important bankers whose aid was enlisted and also by the Secretary of the Treasury and the Federal Reserve Board. The highest hopes have been roused, particularly throughout the Southern States, that the vast sum of money proposed to be put at the disposal of those wishing to hold cotton would greatly stimulate the cotton markets and lead immediately to much higher prices, notwithstanding the unprecedented supply of cotton due to a record crop and a violent decline in the world's immediate requirements. So impressive was the plan to the general mind that it became almost heretical to express the slightest doubt of its efficacy. This paper was sharply criticized by some of its readers for saying editorially on October 31: "The interest, then, of the cotton trade in the Cotton Loan Fund is as yet purely that of curiosity; and the main point of this curiosity is as to the character of the persons to whom it is expected that the $135,000,000 will be lent."

On Saturday of last week, Mr. W. P. Holly, Secretary of the Cotton Loan Committee, issued to the various State committees which have been organized throughout the South, a letter of advice and instructions with regard to terms and conditions under which the $135,000,000 may be made available for borrowers, with cotton as collateral. It is probable that no scheme for rendering banking assistance was ever contrived which could be compared with this for complication, rigidity and complete impracticability for all the uses of trade and commerce. After reading it, one is impressed with the pertinency of the question suggested above, "as to the character of the persons to whom it is expected that the $135,000,000 will be lent." It is apparent on the face of the thing that these persons will not be cotton merchants, cotton manufacturers, or, except to an infinitesimal extent, cotton farmers. None of these classes of persons could possibly make any real use of the fund. The requirements governing the lending of it are in one or another way alien from all the practices and necessities of collecting, carrying and distributing the cotton crop. Hence the inevitable conclusion would seem to be that the great fund is to be administered for the benefit only of large speculators in cotton, if such should appear. They alone could amass cotton in warehouses, remove it from the market for fixed periods of time and immobilize it until the pinch should come and the price advance, as seems to be expected by those who have devised the rules and regulations with which the managers of the fund,—the bankers and the Federal Reserve Board,—have surrounded the obtaining of advances from the fund upon the pledge of cotton. After studying these rules and regulations, the mind becomes increasingly suspicious that there is real merit in the contention, so indignantly repudiated by the Secretary of the Treasury upon the authority of the Attorney General, that the entire scheme is in essence distinctly in contravention of the principles, if not of the terms, of our National anti-trust legislation. It is, however, unnecessary to go farther into details; the rules and regulations themselves tell their own story to anybody in the least degree familiar with the trade and commerce in cotton. Consequently, the letter of Secretary Holly to the Southern local committees is printed herewith in full. Perhaps in the future it may be possible to say of it, as Vergil makes his hero Aeneas say of his shipwreck on the African coast: "*Forsan*

—perhaps we shall find it worth while to remember even this by-and-by." The plan is as follows:

* * *

The local committees must satisfy themselves:

(a) As to the responsibility of each borrower.

(b) That the cotton described in the warehouse receipts is of the grade or grades specified in the note; that none of such grades is under "low middling," and that, on the basis of 6 cents per pound for middling, the quality of cotton supplies a margin of 20 per cent above the face amount of the proposed loan.

(c) That the warehouse in which the cotton is stored is a properly protected structure.

(d) That it is not under the ownership of control of the applicant for a loan.

(e) That the warehouse receipts and insurance policies are in proper form.

(f) That storage charges and insurance premiums are paid as stated in the applications. Insurance by marks, numbers and amounts per bale is desired in all cases, and the right is reserved to reject policies or certificates not so written.

(g) That all insurance policies are issued by standard companies, and are so written or endorsed that any loss or damage thereunder will be payable to the Cotton Loan Committee as its interest may appear.

When policies contain a clause requiring the cotton covered thereby to be insured to the extent of a specified percentage (usually 80 per cent or 90 per cent) of its actual value, that such cotton is insured to the extent of the value required.

(h) That the cotton is free of all liens.

(i) That the applicant is the sole owner thereof.

(j) That the bank or banker forwarding the application is reputable and in good standing.

(k) That such bank or banker accompanies the transmittal of the application for said loan with a New York draft payable to the order of the Cotton Loan Committee for 25 per cent of the amount of the applicant's note, for the amount of which draft a Class "B" participation certificate will be issued.

The local committee must also be certain:

(a) That the form of application for loan prescribed by the Cotton Loan Committee has been duly filled out and signed by the applicant.

(b) That the form of transmittal of such application and of subscription to Class "B" certificates, as prescribed by the Cotton Loan Committee, has been duly filled out and executed by the bank or banker forwarding the application.

(c) That the applicant has duly signed the form of note prescribed by the Cotton Loan Committee.

(d) That the proper [illegible] stamps have been attached to such note and cancelled.

Each application for a loan must receive the approval of at least two members of the local committee, one of whom shall be the chairman. In giving [illegible] the local committee will recite its full title [illegible] Loan Committee for New Orleans."

Each application [illegible] to the committee for the State, which includes the [illegible] committee is acting. When the State committee consists of one or more members each loan shall be approved by [illegible] thereof, one of whom shall be the chairman. When the committee consists of less than [illegible] each committee shall be composed of [illegible] at least two members thereof. [illegible]

Before approving any application [illegible] committee shall satisfy itself that all papers [illegible] in subdivisions 3 and 4 have been duly made out and executed, and are in proper form; and the approval by a State committee of any such application will be considered by the Cotton Loan Committee as equivalent to the assurance of the State committee that it is satisfied that all statements of fact contained in the papers relating to such application are correct.

Unless all forms received in connection with each application are correctly filled out, properly executed and comply with these instructions and with the requirements of the plan, the application cannot be considered, and all papers will be returned to the State committee through which it was received.

Please impress upon banks and bankers through which or through whom applications are made that they are responsible for the payment of interest upon all loans for which they respectively forward applications, which interest, in accordance with the provisions of the note prepared by the Cotton Loan Committee, is payable at the office of the last named committee in the City of New York. No notice when interest payments are due will be sent to borrowers.

Although the plan makes no provision for part payments of loans, a borrower desiring to make such a payment may communicate his wishes to the bank or banker through which or through whom his application for loan was forwarded, which bank or banker must bring the matter to the attention of the Cotton Loan Committee and, in so doing, must state whether or not such bank or banker approves the proposed payment. The Cotton Loan Committee will consider each case separately and deal with it in such manner as the particular facts seem to require, except that no part payment will be accepted unless approved by the bank or banker through whom the loan is made, nor unless interest to the next interest date is paid on the sum prepaid on account of principal.

Payment of notes in full may be anticipated by borrowers, but not until thirty days after notice to the Cotton Loan Committee. If payment of loans is made between interest dates, interest must, nevertheless, be paid to the interest date then next ensuing.

The requirements that the payment of loans may be anticipated only upon thirty days' notice and upon payment of interest to the interest date then next ensuing were inserted in the plan in order to protect the guarantee fund, the balance of which, after payment of expenses and possible losses on loans, is to be returned pro rata to the borrowers. All subscriptions to the fund bear 6 per cent interest. Loans made from the fund carry interest at the same rate. In order that there may be no deficiency in the amounts available for interest payments, it is necessary, therefore, that all moneys loaned shall earn interest until distributed to subscribers.

All insurance policies must be issued by companies satisfactory to the Cotton Loan Committee.

The Cotton Loan Committee reserves the right to reject any application for a loan.

THE WORLD'S WHEAT CROP IN 1914 AND THE PRODUCTION OF THE UNITED STATES

THE wheat crop of the United States for the year 1914-1915 is now estimated to be the largest in the history of the country. According to the English authority, Broomhall's, it will amount to 111,500,000 quarters, or 892,000,000 bushels. The estimate of the United States Department of Agriculture places the Winter wheat at 684,000,000 bushels, and the Spring wheat at 208,000,000 bushels, or a total of 892,000,000 bushels for the 1914 harvest. This is probably the largest crop that has ever been raised in any country of the world in a single year, although the local government estimate of the crop of Russia, including

Siberia, for 1913-1914 was nearly 945,000,000 bushels,—which, however, Broomhall's states to have been "considerably in excess of commercial estimates." The largest wheat crop raised in the United States previous to the current year was in 1913-1914, when the yield was 763,000,000 bushels. That record was approached in 1901, with a harvest of 748,000,000 bushels; in 1906, with 735,000,000 bushels; in 1909, with 737,000,000 bushels; and again in 1912, with 730,000,000 bushels. In no other years has a crop as large as 700,000,000 bushels been produced in the United States. The average wheat production of the country, by groups of years, will be seen in the following table:

AVERAGE ANNUAL WHEAT PRODUCTION OF THE UNITED STATES.

Years.	Bushels.	Years.	Bushels.
1866-75	244,672,000	1890-1900	515,480,000
1876-85	419,940,000	1900-10	670,784,000
1886-90	443,847,000	1910-14	752,740,000

The 1914 wheat crop of all wheat producing countries together was not the world's largest. It reached an estimated total of 3,613,600,000 bushels, as against 3,848,048,000 bushels for the previous year. The percentage of the United States crop in the total world's harvest has shown a steady increase during the past five years. This percentage was 24.6, in 1914; 19.7, in 1913; 19.4, in 1912; 18.0, in 1911; and 17.9, in 1910. The second largest producer of wheat is Russia. During the past five years the Russian crops have held the following percentages in the world's total: In 1914, 21.5; in 1913, 24.5 (on the basis of a return considered excessive by Broomhall's); in 1912, 19.6; in 1911, 14.7; and in 1910, 23.6. Allowing, however, the large Russian figure for 1913 to stand, the average of crop ratios of the United States to world's crops for the five-year period is 19.9 per cent, against an average for Russia of 20.7, or approximately an equal ranking.

It is invariably a source of surprise to the casual student of the world's production of wheat to learn that, despite the vast productive areas known to exist in North America, South America, Australia and India, the European output of wheat ranges well above half of the total world's crop in the average year. As will be seen in the complete record of the wheat production of the world printed at the end of this article, the average wheat output of Canada or Argentina has been very little in excess, in normal years, of the crop of Italy or of Germany. France has consistently maintained its position as fourth in the rank of wheat producing countries. The French crop for 1914-1915 is estimated at 37,000,000 bushels. The requirements of the population are so great, however, (the per capita wheat consumption of France being the highest in the world) that the imports of wheat into that country run well above 50,000,000 bushels annually. The following table, based upon the estimated figures for 1914-1915, gives the relative rank of the chief wheat producing countries of the world:

PRINCIPAL WHEAT PRODUCING COUNTRIES OF THE WORLD, 1914.

Country.	Quarters.*	Country.	Quarters.*
United States	111,500,000	Germany	19,000,000
Russia (incl. Siberia)	97,300,000	Spain	14,200,000
India	47,000,000	Hungary	13,500,000
France	37,000,000	United Kingdom	7,700,000
Argentina	24,000,000	Austria	7,500,000
Italy	21,200,000	Australia	6,000,000
Canada	19,700,000	Rumania	5,500,000

*One Quarter equals eight bushels.

It is interesting to note that, of the countries in this list which are now at war, only Hungary, Germany and Russia have suffered a decline of relative position as a result of the present harvest. Russia dropped from first to second place; but it must be remembered that some doubt attaches to the Russian figures for 1913. The Russian crop for 1914 is greater than that of either 1912 or 1911. The crop of Hungary showed a substantial decline, having been 19,120,000 quarters in 1913. That country, accordingly, fell this year in rank from eighth place to tenth place. Germany, with its crop of 19,000,000 quarters, as against 21,000,000 in 1913, fell from seventh to eighth place. Austria, with a crop of 7,500,000 quarters, as against 8,300,000 quarters last year, still gained slightly in relative position, going up from thirteenth place to twelfth place. The United Kingdom produced a crop of 7,700,000 quarters, as against 7,100,000 in 1913, and increased its relative standing from fourteenth to eleventh place. France remained stationary at fourth place.

As indicating that the effects of war may not be felt until some time after the conclusion of peace, it is perhaps suggestive to observe the decline of wheat production in two years in the countries most influenced by the Balkan war. This will be seen in the following table:

WHEAT PRODUCTION OF BALKAN STATES.

	1914, Quarters.	1913, Quarters.	1912, Quarters.
Rumania	5,500,000	10,000,000	10,600,000
Bulgaria	2,000,000	5,000,000	5,500,000
Servia	1,000,000	1,378,000	2,044,100
Greece	700,000	500,000	920,000

It will be observed that Greece is the only one of the States cited which does not show an uninterrupted decline in its output during the past three years.

A point regarding which considerable popular misconception exists is the relative suitability for wheat production of Russia and Canada. It is well known that the center of the wheat producing area of the United States has, during the past century, moved with considerable steadiness Westward and Northward. In the years from 1800 to 1825, for example, New York was the principal wheat producing State of the Union. The opening of the Erie Canal in 1825 provided adequate transportation facilities, and for many years, according to Prof. A. P. Bingham, Rochester held a position relatively as predominant with regard to milling operations as that of Minneapolis to-day. In the next decade, however, the States of the Middle West took the lead. The Westward progress by decades from 1839 to 1899 will be seen in the following table, showing the relative rank of wheat producing States in eight years, together with the production of the ranking State in millions of bushels:

LEADING WHEAT PRODUCING STATES.

	1.	2.	3.	4.	Crop of Leading State.
1839	Ohio	Pennsylvania	New York	.....	16
1849	Pennsylvania	Ohio	New York	Virginia	15
1859	Illinois	Indiana	Wisconsin	Ohio	23
1869	Illinois	Iowa	Ohio	Indiana	30
1879	Illinois	Indiana	Ohio	California	44
1889	Minnesota	California	N. Dakota	Indiana	45
1899	Minnesota	N. Dakota	S. Dakota	Ohio	68
1909	N. Dakota	Kansas	Minnesota	S. Dakota	117

It is on the basis of the Northward and Westward tendency thus indicated that the most optimistic predictions have been made with regard to the Canadian wheat production. It can hardly have been other than disappointing to observers of recent crops in Canada to find that the large increase expected has not materialized. On the other hand, the Russian crops have been the world's largest in several seasons, despite the reported inferior quality of Russian labor. The chief obstacle to consistent wheat production supposed to be inherent in Russian conditions as compared to those in Canada is the great cold to which the former country, especially the Siberian section thereof, is subject. Of particular interest, therefore, is a comparison of temperatures in Russia and Canada, as shown in the following table:

AVERAGE MEAN TEMPERATURES, RUSSIA AND CANADA.

	December.	January.	February.
Petrograd	21.7	15.7	17.5
Archangel	12.5	6.6	9.2
Tomsk (Siberia)	— 1.1	— 3.6	3.0
Winnipeg	3.6	— 6.8	— 1.9
Prince Albert	2.3	— 8.5	— 2.9

It will be seen from these figures that the average temperatures in the Russian wheat section are considerably higher than those in the corresponding section of Canada.

It is worth noting that the United States exported, during the governmental year of 1913-1914, 19.07 per cent of its wheat crop. Despite the relatively low yield per acre in this country, as compared with that of other countries (the estimated yield in the United States being between twelve and fifteen bushels per acre, as against a yield in Great Britain, for example, of over twenty-five bushels per acre), yet the relative export ratio continues to be high, considering the large annual increase in our population. One cannot help recalling the famous prediction of Sir William Crookes, President of the British Association for the Advancement of Science, with regard to this matter. In a speech before the association in 1898 Sir William made the following observation: "It is almost certain that within a generation the ever-increasing population of the United States will consume all the wheat grown within its borders and will be driven to import, and, like ourselves, will scramble for a lion's share of the wheat crop of the world."

The year 1931 was fixed upon by the speaker as the time when the world's consumption of wheat would exceed its production. An even earlier time was recently suggested by another authority, at which the United States might cease to have an available surplus of wheat to help supply the European deficit, viz.: Prof. F. W. Taussig, of Harvard University, in his "Principles of Economics." In discussing the theory of comparative advantage as influencing international commerce, Professor Taussig, writing in 1909, made the following comment: "The exports (of wheat) are now declining and may cease in the course of a decade. The tendency to decline in these once heavy exports is commonly ascribed to the fact that we 'need' the domestic product for our rapidly increasing population. This is true as far as it goes. But the reason why the product fails to keep its former relation to population is the increasing cost (marginal cost) of wheat. The increase in cost means, in other words, lessening effectiveness and lessening comparative advantage; hence lessening exports."

In view of these statements, which must wait in one case until 1931, and in the other until 1919, before their truth can be wholly determined, the present percentage of our wheat crop exported is of particular interest. Looking back over the record of years, it is evident that considerable fluctuations in this ratio of exports to total production have taken place. Records are scanty in the early years of the nation's development. In the Statistical Abstract of the United States the percentage of the crop exported in 1840 is given as 12.10; that exported in 1850 as 6.81; and that in 1860 as 9.19. After the Civil War a sharp advance in the ratio took place. From a percentage of 7.89 in 1867, the figure of 22.30 was reached in 1871; 32.54, in 1874; and 40.18, in 1880. This large proportion of exports was not reached again until 1894, when the figure was 41.47. In 1898, the year of Sir William Crookes' remarks, a slightly higher export ratio was attained,- namely, 40.9 per cent,—and the maximum was reached three years later, with 41.36 per cent.

A period of sharp decline followed. The export percentages for the next four years, beginning with 1902, were 31.37, 30.28, 18.92, and 7.99—the last being the lowest since 1867. A steady rise then followed until, in 1908, the figure of 25.71 per cent was reached. In 1911, however, the ratio had fallen as low as 10.91, but increased again to 12.83 in 1912, and to 19.57 in 1913. In other words, in spite of sharp fluctuations in the ratio of exports to production, there seems to be no immediate prospect that with average conditions our domestic requirements of wheat will equal our production within seventeen years. Sir William Crookes estimated the population of the United States in 1931 at 130,000,000. In 1913, with a population of less than 100,000,000, we spared for export nearly 150,000,000 bushels of wheat, and our estimated surplus this year is 272,000,000 bushels. Even on the basis of the 1913 crop, with an increase in population in 1931 of 30,000,000, requiring four and one-half bushels of wheat per capita annually, there would still remain fifteen millions of bushels in excess of domestic requirements; and this leaves out of account the natural increase in wheat acreage and production. The acreage has increased from 20,000,000 acres, the average for the years 1866-1875, to 50,000,000 acres in 1913. The increase in production has been shown in an earlier table. It has manifested a steady increase, by periods of years, since 1866. The period 1910-1914 showed an increase in production of over 80,000,000 bushels annually, as compared with the decade 1900-1910.

It should not be assumed from these remarks that the world's requirements are vastly below the world's production, even at the present time. For example, the London "Statist" in a recent issue estimates the world's requirements, as compared with the available surpluses for the current year, as follows:

WORLD'S WHEAT REQUIREMENTS AND SURPLUSES, 1914-1915.

	Requirements. Quarters.		Available Surpluses. Quarters.
United Kingdom	26,500,000	United States	34,000,000
France	7,000,000	Canada	11,000,000
Italy	6,500,000	Russia	15,000,000
Belgium	7,000,000	Rumania	3,000,000
Holland	2,500,000	Argentina	8,000,000
Spain	1,500,000	India	4,500,000
Switzerland, Portugal and other European countries	4,500,000	Australia	2,000,000
Non-European countries	10,500,000	Other countries	500,000
	66,000,000		
Germany	8,500,000		
Austria-Hungary	4,500,000		
Total	79,000,000	Total	78,000,000

It would appear from this estimate that, were Germany and Austria-Hungary in a position to import wheat, the world's surplus would be inadequate to meet the current demand. It should be borne in mind, however, that variations in the world's harvest of wheat, amounting to from 10,000,000 quarters to 40,000,000 quarters, have not been uncommon, and have been taken care of without hardship in the wheat consuming countries. In other words, the various elements in the law of supply and demand are brought into play with regard to the wheat crop from year to year. If a relatively large surplus is available the price will tend to decline, and the extra supply to be absorbed with small increase in the relative amount of money expended by each purchasing country to obtain its wheat supply. If the available surplus is relatively small, prices rise, and the purchases of wheat are reduced. But economies result all over the world in the use of wheat; waste is curtailed; and, indeed, before the famine point could be reached it would be necessary to exhaust the available resources of mankind in respect of the development of the greatest possible wheat acreage and the largest yield per acre consistent with the law of the diminishing return, and finally, as a last resort, in the application of the Malthusian doctrine of restriction of the increase of population.

A most suggestive illustration of the remark that the ordinary

course of distribution of the average enormous wheat crop does not exhaust the sources of supply is furnished in Professor Taussig's observations upon various attempts to form "corners" in wheat. He points out that the actual operations looking toward the cornering of the supply reduce (without apparent hardship) the consumption of the commodity, thus relatively increasing the available supply; and simultaneously there develop, at numerous points, wholly unexpected sources of supply which drain the financial resources of the manipulator and usually end in the failure of the attempt, as in the famous case of the Frenchman, Secretan, whose efforts to corner the wheat market in 1887-1888 led to his failure and suicide.

In conclusion, there is appended Broomhall's annual statistical survey of the world's wheat production, covering the world's harvest of wheat for the crop season of 1914-1915, with comparisons for the three previous seasons.

Official returns are taken when obtainable, excepting in certain cases, where recognized estimates are adopted in preference. The returns represent the crops harvested in July and August of the years named, excepting in the cases of Argentina, Uruguay, Australasia and Chili, which are harvested fifteen weeks subsequently, and in the case of India still somewhat later. For the current year forecasts only can be given for these five growers.

WORLD'S WHEAT PRODUCTION BY COUNTRIES.

ECONOMIC NOTES

British Loan of $50,000,000 in China.—Consul General Arnold, stationed at Hankow, China, has submitted a report to the Department of Commerce with regard to a large British loan negotiated with the Chinese Government to cover improvements in Hankow. This report is of particular interest in connection with Mr. C. L. Chandler's article on British investments printed in last week's issue of this paper. The statement of Consul General Arnold is as follows: "The local manager of one of the foreign banks confirms the report of the conclusion of a loan agreement between Samuel Samuels & Co., London, and the Chinese Government, whereby Samuel Samuels & Co. are to furnish at the expiration of the present war the sum of £10,000,000 ($50,000,000 in round numbers), a portion of which is to be expended on the construction of a bridge across the Yangtze River and one across the Han River, connecting the Wuhan cities Hankow, Hanyang, and Wuchang, and permitting the Hankow-Szechwan and Hankow-Canton Railways to enter Hankow city. Such portion of the loan as is not used for the two bridges (it is estimated that these bridges will cost less than £5,000,000) will be used in the reconstruction of the city of Hankow along modern lines. The agreement, so it is reported, grants to Samuel Samuels & Co. the exclusive right to furnish such foreign materials as are necessary in the construction work."

* * *

Personal Income Tax Returns in the United States for 1913.—The annual report of the Commissioner of Internal Revenue, issued in Washington on December 11, gives the returns from the revenue tax upon personal incomes for the collection year of 1913 (government fiscal year ending June 30, 1914). It is to be remembered that the personal income tax collected for 1913 covered only ten months of the year, and that consequently the amount collected could be only ten-twelfths of the amount for a full year. Moreover, it is probable that many persons, by reason of the variation of their incomes in the earlier and the later months of the year, were not taxable in 1913, though they would have been upon the basis of a full year's income. The figures, consequently, cannot be taken, even proportionately, as conclusive with regard to the normal annual yield which the government will obtain from the personal income tax. This is said because of the astonishment and disappointment expressed in many quarters, political and other, at the small number of taxable incomes reported and the unexpectedly low aggregate amount of the tax assessed,—though it must be admitted that the actual returns fall amazingly below the estimate of $70,135,000 (for a full year) made by Treasury experts when the Underwood Tariff Act was being framed by Congress.

The total number of individuals paying tax upon their personal incomes for the last ten months of 1913 was 357,598, of whom 272,153 were married men, 6,682 were married women, 55,212 were single men, and 23,551 were single women. Of the total number of taxpayers, 1,426 were Americans residing abroad; and 425 were non-resident aliens. The normal tax of 1 per cent on all taxable incomes yielded the sum of $12,728,058; while the surtax on incomes over $20,000 a year produced $15,527,497. The total amount of tax collected was, therefore, $28,253,535 for the ten months included, or at the rate of $33,904,242 for a full year. Of the amount derived from surtaxed incomes, $2,934,754 came from incomes of between $20,000 and $50,000; $1,645,639 from incomes between $50,000 and $75,000; $1,223,023 from incomes between $75,000 and $100,000; $3,855,948 from incomes between $100,000 and $250,000; $2,554,583 from incomes between $250,000 and $500,000; and $3,437,850 from incomes above $500,000. The complete classification of incomes returned as taxable is shown by the following table:

TAXABLE PERSONAL INCOMES IN THE UNITED STATES.

Incomes Classes.	Persons Taxed.
$1,000,000 and over	44
500,000 to $1,000,000	91
400,000 to 500,000	44
300,000 to 400,000	84
250,000 to 300,000	94
200,000 to 250,000	145
150,000 to 200,000	311
100,000 to 150,000	785
75,000 to 100,000	998
50,000 to 75,000	2,618
40,000 to 50,000	2,427
30,000 to 40,000	4,553
25,000 to 30,000	4,164
20,000 to 25,000	6,817
15,000 to 20,000	11,977
10,000 to 15,000	26,818
5,000 to 10,000	101,718
3,333 to 5,000	114,484
2,500 to 3,333	79,426
Number of incomes	357,598

The report of the Commissioner of Internal Revenue further classifies the returns by collection districts; and, as was to be expected, it is found that much the largest portion of the income tax for 1913 was paid by individuals dwelling in or near a few large Eastern and Northern cities, particularly New York, Boston, Philadelphia, Chicago and Detroit. Out of 135 incomes of $500,000 or more, no less than eighty-two were found in the State of New York alone. The following table shows the general classification of the taxable incomes in the State of New York, these being no less than 81,194 out of the 357,598 taxable incomes in the entire United States:

TAXABLE PERSONAL INCOMES IN STATE OF NEW YORK.

Income Classes.	Persons Taxed.
$500,000 or more	82
400,000 to 500,000	17
300,000 to 400,000	48
250,000 to 300,000	46
200,000 to 250,000	63
150,000 to 200,000	105
100,000 to 150,000	278
75,000 to 100,000	467
50,000 to 75,000	879
40,000 to 50,000	851
30,000 to 40,000	1,422
25,000 to 30,000	1,284
20,000 to 25,000	1,632
15,000 to 20,000	2,611
10,000 to 15,000	5,112
5,000 to 10,000	25,328
3,333 to 5,000	20,954
2,500 to 3,333	11,202
Number of incomes	81,194

Production and Consumption of Sugar in the United States.—Figures have recently become available covering exports of sugar from the United States during August, September and October, 1914. They reveal a surprisingly large outward movement of this commodity, amounting for the three months to 229,620,000 pounds, as against a total of exports of sugar for the entire fiscal year 1913 of 67,000,000 pounds. In fact, the total sugar exports for the three months ended October 31, 1914, exceed those of any fiscal year in the history of the United States, with the exception of those during the year 1885, which amounted to 258,000,000 pounds. The exports for August amounted to 38,956,305 pounds; those for September to 52,290,773; and those in October to 138,372,686. The effect of the European war is, of course, apparent in these figures, in that the beet sugar supply of the belligerent countries has been barred from the world's markets.

The following table, compiled from the Statistical Abstract of the United States, sets out the chief factors connected with the movement of sugar in the United States during the fiscal year 1914, together with comparisons with the fiscal years 1913 and 1894:

(In Millions of Pounds.)

Domestic Production.	1914.	1913.	1894.
Cane sugar	601	342	610
Beet sugar	1,240	1,385	45
Total production	1,841	1,728	655
U. S. Imports from			
Porto Rico	641	765	76
Hawaii	1,114	1,085	327
Philippines	116	203	124
Totals	1,872	2,054	526
From foreign countries	4,950	4,536	3,819
Total Imports	6,822	6,589	4,345
Total domestic production and imports	8,663	8,318	5,000
Exports	96	66	64
Domestic consumption	8,567	8,252	4,936
Per capita consumption (pounds)	86.8	85.0	72.9
Per Cent of Consumption Supplied by			
Continental United States	20.6	20.8	13.3
United States islands	21.9	24.7	10.7
Foreign	57.5	54.5	76.0
Totals	100.0	100.0	100.0
World's production	35,860	40,711	16,532
Per cent of world's production consumed in United States	23.9	20.3	29.9

* * *

Corporation Income Tax Returns in the United States for 1913.—Besides the figures for the personal income tax returns, the annual report of the Commissioner of Internal Revenue gives the returns from the corporation income tax during the Government fiscal year ended June 30, 1914. The statistics show that the corporations doing business in the United States in 1913-1914 were 316,909 in number, as compared with 305,336 in the previous fiscal year. The aggregate capital stock reported as issued by the 316,909 corporations in 1913-1914 was $64,071,319,185, an increase of approximately $2,333,000,000 over the capital stock outstanding for the 305,336 corporations in 1912-1913. The bonded and other indebtedness of corporations in 1913-1914 was reported as $37,136,215,096,—making their total capital obligations aggregate the vast sum of $101,207,534,281, or more than two-thirds of the estimated wealth of the United States. The net income of the reporting corporations in 1913-1914,—i. e., their income after deduction of interest on their bonded and other indebtedness, depreciation and bad debts, was $1,339,550,008, or nearly 7 per cent on the amount of their outstanding capital stock. This net income showed an increase of more than $500,000,000 over the net corporation income reported in the fiscal year 1912-1913.

INSURANCE

A DAY or two after the destruction by fire, last week, of Mr. Thomas A. Edison's extensive factory building in New Jersey, he was visited by a newspaper reporter, sent to ascertain the extent of the loss and the effects of it upon the great inventor's own fortunes, as well as upon his state of mind. The interview, as recorded in the New York "Sun," is interesting from more than one point of view; and at the same time it is suggestive in respect of a problem of fire insurance about which the public and, indeed, no small number of persons engaged in the fire insurance business itself are far from clear. The matter can perhaps best be brought out by giving the material portion of the interview between Mr. Edison and the reporter. Asked in general terms what he had to say about the loss of his great property, Mr. Edison characteristically said: "It's just another experience; mine, as a rule, are not so expensive." Then the colloquy continued:

"What would you estimate the loss to be, Mr. Edison, in the light of to-day's developments?"

"I think about $2,000,000," replied the inventor. "No, I didn't have any insurance. I understand, though, that the boys had placed some insurance on two frame buildings; I don't know how much."

By "the boys" he meant the men associated with him, some of them of nearly his own sixty-seven years. He went on.

"I'll tell you how I felt about insurance. A good many years ago I owned a factory that we dcided to abandon. It was insured. Renewal of insurance was refused. The company said that abandoning the factory raised a 'moral issue' as to the insurance.

"What they meant and made clear was that they thought I might set that abandoned factory afire to get the insurance! Well, I just made up my mind that never thereafter would any one get a chance to raise moral issues about my business."

It is, of course, unnecessary to dwell upon the personal susceptibilities of Mr. Edison, which made the merest suggestion of what he denominates a "moral issue" (meaning, naturally, "moral hazard") in connection with himself a sufficient cause for abjuring forever and a day fire insurance and all its works. He belongs to that race apart, the men of creative genius, with all their sensitiveness,—*genus irritabile vatum;* and his practical decisions are not required to have the regulated quality which plain mortals must strive for. None the less, when he charges some fire insurance company with having refused to renew the insurance on certain of his buildings because he was about to abandon them, he raises the question whether or not the company was following a sound business rule within its, and not his, domain. It is not supposable that the agents or officers of any fire insurance company were actually concerned lest Mr. Edison should with criminal intent have his abandoned buildings burned up, so as to collect the insurance. Yet some company, or its agents, apparently did bring up the technical point of increased "moral hazard" by reason of the abandonment of the buildings, even if Mr. Edison did own them. Was the company justified in so doing?

Some light upon this question may perhaps be obtained from approaching it from a slightly different angle, and asking the question, which is one of pure underwriting: "What is the insurable value of a building whose owner has determined to destroy it after a certain space of time, for the purpose of replacing it with another building? An esteemed correspondent of this paper not long ago recounted the expressions of amazement from both property owners and fellow insurance agents in a large Texas city, which greeted his immediate cancellation of the entire line of fire insurance he had placed on a large hotel in that city, upon his learning that the entirely reputable and responsible owners had made plans to pull down the structure in about a year and to erect a more modern building in its place. His contention was that, the moment the old building was condemned by its owners, in their own minds and plans, to destruction, there was a coincident wiping out of the insurable value and, at the same time, so great an increase of the "moral hazard," no matter how upright and responsible the owners, that the continuance of the insurance could not be justified upon any grounds of sound business.

Obviously, the case of buildings merely abandoned is not quite the same as that of buildings condemned to be torn down. It may be contended that the insurable value of the former is not *ipso facto* destroyed; some day the abandoned buildings may be used again, or may be sold to another owner who will use them. But in the matter of the increased "moral hazard," the difference between the two cases is infinitesimal; and this is true almost without regard to the personal and business probity of the owner of the property. It is a far too prevalent error to assume that "moral hazard" in the field of fire insurance has to do purely and simply with the essence or absence of criminal motives or inclinations on the part of the insured. The truth of course is that the "moral hazard" is really good only when the property owner is actively interested in the protection of his property from fire, when that property has positive value in his own eyes and for the purposes of his own use or employment, when in short he will clearly lose more than he can possibly gain from having it burned up. The moment a piece of property comes to be in such a situation, in respect of its owner, that all expenditures upon it in the way of maintenance, proper repair of the structure and its equipment, and general safeguarding of it against the risk of fire, appear to the owner himself to be just so much good money wasted, then that something which fire underwriters know as "moral hazard," in one of its most important phases, comes into play, even though the owner's scrupulous honesty is not open to the slightest suspicion. To such an extent is this true that when the determination to destroy and replace a building has been arrived at by its owner or owners, there is no doubt that sound underwriting principles require the immediate cancellation of all fire insurance upon it, unless the building have some salvage value, in which case the insurance should be based solely upon this salvage value. In the case of the abandonment of buildings, such as Mr. Edison's factories, perhaps less summary action may be necessary. Even then, however, the question of the permissible amount of fire insurance is not one to be resolved simply according to the character of the owner. The character of the property is of much more importance. If this is such that it is improbable that further use will be made of it, whether by the owner or by somebody else, within a reasonable length of time, the same rule should be applied as when the property is marked for demolition. In other words, possibility of further use is the sole measure of the insurable value of such property; and Mr. Edison, despite his genius, showed a complete misconception of the matter when he abjured fire insurance because, as he said: "I just made up my mind that never thereafter would any one get a chance to raise moral issues about my business." Though the business of fire insurance is conducted by private corporations for the most part, the real insurers are the whole mutual body of property owners who contribute to the indemnification of any loss through the premiums they pay. No one, not even Mr. Edison, has the right to expect that these mutually contributing property owners should carry the risk of more than the absolute present value of the property of any one of their number.

THE INFLUENCE OF COMPETITIVE CONCESSIONS ON LIFE INSURANCE

By John B. Lunger*
Vice-President, Equitable Life Assurance Society

AT a gathering of insurance workers a few years ago, in speaking of the growth of Life Insurance in the United States, I referred to the period between 1880 and 1905 as the Era of Expansion. Within that short span of twenty-five years the amount of life insurance in force was multiplied seven times over,—increasing from $1,500,000,000 to $10,500,000,000,—and the assets of the companies increased in almost equal proportion, from $420,000,000 to $2,650,000,000. Equally rapid, though not always equally substantial, growth and expansion were during the same period observable in our great railroad systems, in our other public service corporations, and in our industrial enterprises. It was a period of keen activity in many directions; and American energy, initiative and genius for organization found wide expression. The resulting increase in national wealth, together with the growth of population, were prime factors in the expansion of life insurance, as well as of other forms of savings and investment. In any event, increasing wealth and population furnished the opportunity. That the leaders in life insurance, ever alert, took advantage of the opportunity, is evidenced by the figures which I have quoted.

With rapid growth came the desire for still greater results, until in some companies the ambition to write a constantly enlarging volume of new business became an obsession, displacing for the time being the advantages of a moderately aggressive development and a well rounded record. The sharp competition for volume led to the introduction into the policy contracts of numerous concessions as bids for new business, while old benefits were increased and broadened. This liberality in the matter of policy guaranties was attended by a considerable increase in the cost of new business.

I am not disposed to criticise the increased expenditures; without them the business would not have been multiplied seven times in twenty-five years, and economically it is worth a good deal to have a business developed from a localized benefit into one of the greatest national blessings. Also, in the case of many of the concessions I am disinclined to be critical; for beyond a doubt they developed the life insurance policy from a somewhat narrow and technical instrument into a broad and comprehensive contract. But the fact remains that, by the end of the period which I have called the Era of Expansion, policy concessions had been carried to the point where it seemed no longer possible to add to them; and in some directions they had been carried so far that they ceased to be a real benefit to the policyholders.

This was the situation when laws were passed in the State of New York, in 1906, to regulate and control the operations of the life insurance companies, and standard policy provisions were soon recorded on the statute books of several States.

At the outset it was hard for me in the life insurance business to view, in a temperate frame of mind, the enactment of such laws. I had myself been too busy, perhaps, to observe the effects of unfettered ambition and untrammeled competition in other lines of business, or to consider the changing conditions which were creeping into Life Insurance.

I should like to be able to say that my own change of base was due solely to the intrinsic merit of the new laws; but I must confess that the chief influence in my case was the hope that in regulation might be found a way to enforce a settlement of the questions upon which we have never been able to agree amongst ourselves. I could not recall a single conference called for the general good that had effected a lasting reform, or many that had led even to a temporary benefit. It was always the old story. You are all familiar with it,—so long as a competitive advantage could be secured by adhering to methods in vogue, some one objected to any change or urged postponement of action. The futility of co-operation having been forcibly impressed on my mind, I passed to the conclusion that in life insurance, at least, State regulation is the only practical check on self-interest and ambition, and the only efficacious curb on unwise practices and over-liberal concessions.

With this preliminary statement, which is intended to set forth in outline the rapid growth of the business and the competition incident thereto, and also to point out how regulation may serve a useful purpose not originally contemplated, I will endeavor to trace the influence of some of the competitive concessions made between 1880 and 1905, and of the practices of the period, upon certain of the Laws of 1906; and to suggest wherein it may be possible now to amend such laws, to the benefit and advantage of the companies and their policyholders.

The concessions took the form chiefly of Loan and Surrender Values frequently increased, and of plans for appealing to self-interest by so-called investment benefits, depending for their attractiveness on the accumulation of surplus earnings over a period of years, usually fifteen or twenty, the normal annual earnings being supplemented by interest accumulations and by the forfeiture of the surplus on policies which did not continue in force until the end of the period.

To check these large accumulations and to compel an annual distribution of surplus, Sections No. 87 and No. 83 of the New York Insurance Law were passed. Section No. 83 requires annual dividend distributions to policyholders. Section No. 87 limits the contingency reserve, or surplus, of the companies to a percentage of the net values of their contracts, which percentage, in the case of companies with net values in excess of $75,000,000, is 5 per cent thereof.

At the time this Section was under consideration at Albany, competent and experienced officials represented that the requirement of annual dividends, as per Section No. 83, and the competition between the companies to make a good showing in this respect, would be an adequate check upon undue accumulations of surplus, and that a limitation of surplus funds, especially to such a low ratio as 5 per cent, might in the course of time invite some problems. In the few years which have passed since this law went into force we have experienced financial disturbances and economic phenomena which have proven the wisdom of the advice then given.

The world-wide decline in security values, which is part of the phenomena, has found a partial compensation in an increase in the rates of interest. In consequence of this increase, it is probable that the new investments of the companies in the last five or six years have been made at an average rate of three-quarters of 1 per cent over the average rate for several years prior to 1907. Pending the return of security values to former quotations, no company in which the surplus exceeds the 5 per cent limitation should be compelled to distribute in dividends such additional interest earnings; especially if the company is compelled to value its bonds on the amortized plan. It would be safer and in better keeping with sound practice to permit the company to set aside in a Securities Fluctuation (or similar) Fund, that part of its interest earnings which are due to the increase in the rate of interest, in order that by such savings it might gradually replace any decline in values. Then, if the decline should be recovered

*A paper read before the Association of Life Insurance Presidents, at New York City, December 11, 1914.

solely by an improvement in general conditions, it would not be difficult to distribute such special fund amongst the policyholders. I, for one, would advocate the entire repeal of this Section; but if it be decided to retain it, then I would urge its being made very much more elastic.

Next I come to Section No. 83, which requires the ascertainment and annual distribution of surplus. This law was aimed at policies with so-called "investment" features, and under which the surplus earnings were distributed on the deferred dividend plan. After this lapse of time, let us admit in all fairness that the fault of this method of paying dividends was not in the plan itself, but in the abuses to which the plan was subjected. If a law had been framed correcting the abuses and requiring an annual accounting of surplus, I believe there would have been no further cause for complaint. Nevertheless, I would not advocate a change in this Section, except in one respect; and that is in the case of one particular class of policies, small in relative volume but possessing very special importance,—namely, the policies issued on sub-standard lives. At the present time, not less than thirty millions of new insurance of this kind is issued in the United States each year. It constitutes, on this and other grounds, a volume of insurance worthy of special consideration and of special treatment.

In a general way, sub-standard lives, for life insurance purposes, may be divided into two groups: The first, those amongst whom the extra mortality increases with time,—that is, with the duration of the policies, the heaviest death rate proportionately occurring in the later policy years; and the second, those amongst whom the extra mortality diminishes or improves with time,—the heaviest death rate proportionately occurring in the early policy years.

Under the law, as it now reads, the only practicable method of finding compensation for this extra mortality is to charge an extra premium, usually obtained by rating up the age of the insured. It does not follow, however, that this is the best method or the most scientific. Those who have had the longest experience in the conduct of sub-standard business would hold, I believe almost unanimously, that the benefits of this class could be extended and advantages gained for the policyholders, if the law were amended so as to allow the companies to find compensation for the extra deaths by the use of liens and the establishment of separate surplus funds, as formerly. By the use of these "offsets" to extra mortality, used separately or together, it would be possible to issue a large percentage of the policies at regular tabular rates, besides automatically providing a way of rewarding those who outlive their expectancy.

Let us now turn to Section No. 88, defining the surrender values of lapsed and forfeited policies, and to that part of Section No. 101 which relates to policy loans. In these statutes we find evidence of an intention, not only to protect the interests of policyholders, but to confirm in the law the practices of the companies at the time the laws were drafted.

Although, prior to 1906, the New York statutes contained a provision which had been enacted as early as 1879, requiring a surrender value in the form of paid-up or extended insurance, this was inadequate to express the measure of liberality which had become practice by 1906. Hence the old law was amended into the present Section No. 88. This provides that, in the case of a policy issued on and after January 1, 1907, the entire reserve, less one-fifth, or the sum of two and fifty one-hundredths dollars for each one hundred dollars of insurance shall, upon demand not later than three months after the date of lapse with surrender of the policy, be applied as a Surrender Value, as agreed upon in the policy. While the law defines the minimum of the reserve which shall be paid or applied to Surrender Values (which consist of cash values, paid-up insurance or extended insurance), in practice this minimum is exceeded. Nearly every company allows the entire reserve as a Surrender Value in cash, or its equivalent in paid-up insurance, after the tenth year of insurance, and deducts less than the surrender charge allowed by law in the early policy years. It is perhaps in the increase of cash surrender values and in reducing the intervals, or periods, at which they may be taken that the competitive concessions, to which I have referred, found their most questionable expression during what I have called the Era of Expansion. In 1880, very few companies guaranteed cash values at all—only one company, so far as I can determine, guaranteeing annual cash values. Later, certain companies adopted values payable at the end of each fifth year of insurance; but by degrees, under the force of competition, annual values became general, and then the amounts of the values were gradually increased, until guaranties equal to the full reserve were reached and competition could go no further. The effect of this was to emphasize the importance of the individual policy—displacing the principle which regarded the interests of the whole body of the insured to be paramount to those of the individual.

The old-fashioned notion was that each retiring policyholder,—each deserter from the ranks, as it were,—should pay a proper surrender charge as a *quid pro quo* for the loss sustained by the whole body of policyholders through his retirement. While the present law allows a surrender charge, there is nothing in the law forbidding the companies to waive such charge; hence we find that certain companies are paying the full reserve after the policy has been in force a few years,—in two or three companies, after only three years. In other words, the law protects the deserter by stipulating that he must be paid certain minimum values, but fails utterly to act in the interests of the whole body of policyholders by prohibiting larger payments to the deserter than he is in equity entitled to receive.

Herein is the defect in the law. It should define a surrender charge adjusted to the kind and age of the policy; and then it should provide that no company shall guarantee in its policies, or pay in practice, a larger cash value than the reserve, less such surrender charge. If a surrender charge should be imposed in all cases when cash is taken, the amount of such charge could be used to replace the retiring policyholder, without casting the burden of cost on the persistent policyholders. If need be, it could be used as a compensation for a decline in values, an unexpectedly high mortality or other contingencies.

Undoubtedly, cash values are a great help to policyholders in times of emergency. We must never forget that sometimes it is of more importance to protect the insured and his family, while the insured is living, than it is to protect his family alone after he is dead. But no policyholder should be permitted to retire and withdraw his entire equity in reserves, thereby transferring his share of any depreciation or other unfavorable contingency to those who remain.

In Section No. 101 of the New York law, which specifies certain standard policy provisions, is found a requirement that after three full years' premiums have been paid the company must, at any time while the policy is in force, advance, on proper assignment or pledge of the policy, and on the sole security thereof, at a specified rate of interest, a sum equal to the reserve at the end of the current policy year on the policy and on any dividend additions thereto, less a sum not more than 2½ per cent of the amount insured by the policy.

The Policy Loan thus provided is the offspring of the Cash

Value; and, like its parent, is has strayed into tracks divergent from the old main road. As in the case of Cash Values, Loan Values have been carried to extremes,— the general practice being to loan, as well as to give as a cash value, the full reserve upon the policy after the tenth year of insurance.

Of the two concessions, the cash value is the more defensible, on the theory that it is wiser for a man to sell his house than to risk its loss by excessive mortgaging. No concession ever granted has caused graver disappointment to beneficiaries than Policy Loans. This is particularly true when the loans taken with the assistance of the Change of Beneficiary Clause, whereby the wife of the insured is too frequently denied a knowledge of the transaction. In two companies at least, in the case of policies drawn in favor of the wife, unless the insured insists upon his privileges under the Change of Beneficiary Clause, an effort is made to obtain the wife's signature to the loan papers. It is surprising how often the mortgage of a policy is thus avoided. One class of loans,—those taken out on policies issued for the protection of business ventures or for surety commercial purposes,—are always justifiable; they are serving a purpose for which the contract was entered into. But one cannot view with equanimity the taking of loans on policies issued for family protection; and, unfortunately, the greater number of loans are taken on this class of policies, thereby lessening the protective benefits of life insurance. If those who have it within their power to make and amend laws could know the disappointment incident to policy loans and the hardships which are often inflicted on the insured himself, they would find sufficient reason in these disappointments alone to amend this Section, so that loans would be mandatory only for the purpose of paying premiums, leaving the question of an additional loan to the judgment of the officers of the companies, but stipulating that it shall in no case exceed the Cash Value, which, as I have pointed out, should be on a reduced basis.

There are many here to-day who were engaged in Life Insurance in the days when Cash Values were paid and Cash Loans made by voluntary concession only, no guaranties being embodied in the policies. I do not believe that any person present can recall a complaint by a policyholder of injustice or even of embarrassment, excepting, possibly in the case of one or two companies which declined to make loans on any pretext, even for the purpose of paying premiums.

In foreign countries, where life insurance has been practiced longer than here, underwriters have prudently abstained from following our lead with respect to maximum cash values, although they have adopted several of our American innovations. In a review of the cash surrender values offered by the English companies, I find that in the case of thirty-nine, the cash values range from 25 per cent to 50 per cent of the premiums paid. The values for all ordinary [illegible] of insurance are very much below the reserve held [illegible]. In no case, so far as I can discover, is more than [illegible] reserve guaranteed; and in general the values are [illegible] per cent lower than in this country.

The English companies also [illegible] policy loans and usually some reference thereto is made in the policy contracts; but, as a rule, the amount of loan procurable is not stated. The prospectuses of the companies show that in practice loans are limited to the cash surrender values, which, as above noted, are always well within the reserves. The policy of one company contains a further unique provision, to the effect that, if [illegible] the rate of discount at the Bank of England is 7 per cent or more at the time the Cash Value is applied for, the Directors may either pay a reduced value or defer payment until the rate falls below 7 per cent. That the person who drafted this condition possesses, amongst his other traits, that of perspicacity, is only too well evidenced by the present distressing conditions on the other side of the sea.

I have also inquired into the practice of the French companies with respect to Cash Values. I find that the policies of the leading companies provide for Cash Values; but the amounts, instead of being specified in the contracts, are subject to the rules of the Board of Directors at the time of surrender. Except in the case of one company, the values do not exceed 85 per cent of the reserves, closely following the English practice. Again, in France, as in England, the policies mention that Loans will be granted; but only one of the leading companies enters tables of amounts. In practice, loans are made up to an amount not exceeding 95 per cent of the Cash Value. One of the French companies checks against declining values in securities by providing that, in case French rentes are quoted below 90, the Cash Value may be reduced.

From this statement of foreign practice, it will be seen that, both in the granting of the Cash Values and in the granting of Policy Loans, the English and the French companies are far more conservative and prudent than the American companies, avoiding extreme liberality and safeguarding their policyholders by keeping their payments fairly within the reserves.

Another point with respect to Cash Values and Policy Loans which we must consider is that the investments of the life insurance companies are made with regard to the maturity of the policy contracts and the continuance of the business under normal conditions. The two most common forms of investment, therefore, are mortgages and long-time bonds. When money is easy and there is an active investment market, it is possible to realize upon bonds, or to collect a part at least of the mortgages which mature. On the other hand, under unfavorable conditions these two classes of securities are anything but liquid. Consequently, it follows that if unduly liberal Cash Values and Policy Loans are to continue to be a feature of policy contracts, the life insurance companies will eventually be required to make short-time or "call" loans. These forms of investment are now practically denied to life insurance companies.

At present, there are apparently only two ways by which the companies can protect themselves against the possibility of a long continued drain upon their resources, if one should occur in the years to come. One is by carrying large cash balances, which is obviously objectionable; and the other is by purchasing short-time bonds, of which there are comparatively few in the market. And if life insurance should develop competition therefor, the price would be raised on high-grade securities of this character to such a point as to make the returns inadequate.

In my opinion, the question of the possible ultimate effect of cash guaranties on investments is one of the most important before us to-day, and especially as such guaranties are gradually converting each company, to the extent of its reserves, into a sort of a combination of a life insurance company and a savings bank.

It is difficult to make an estimate of the proportion of present reserves which are subject to cash demands, but it is a considerable percentage of the whole. As the old policies, which do not provide for cash, are becoming less in number each year, we may look forward to the time,—perhaps only fifteen or twenty years hence,—when nearly the entire reserves will be subject to demand payments, unless the tenor of things is changed in the meantime. We already know that the introduction of cash guaranties in our policies has produced some interesting problems; but whether, like the prudent English manager who bases the cash values of his company on the interest rate of the Bank of England, we are

endeavoring to forecast the future with the help of the economic phenomena of recent years, is another question.

To my way of thinking, the defects of the present situation are fundamental. Our cash values and loan values need to be brought down to the level that will not be an inducement to the easy forfeiture of the insurance, but which will tend rather to permanence in the carrying of the policy. I am aware that there is a body of opinion which believes that three or six months' notice of intention to borrow or to demand the cash value is a sufficient corrective. Believing, as I do, that the defects are fundamental, I cannot help feeling that a three or six months' notice is but a superficial remedy. Faults which are basic and have within them the possibilities of becoming a menace cannot be cured by postponement.

It is possible that a comparison of conditions as they existed at the beginning and end of my so-called Era of Expansion might lead to the conclusion that life insurance, as conducted twenty-five or thirty years ago, was not such a bad thing for the public after all. We may have been somewhat straightlaced in our views and less inclined to take risks at that time, as we were certainly more thoughtful with respect to the ultimate effect of concessions granted.

With the assistance of our State insurance officials and our legislative bodies, it appears entirely possible to happily compromise by legislative corrections, so as to find the golden mean between the practices and benefits which obtained at the beginning of our era and those obtaining at its close. And let us not forget that the practices and concessions which are now forcing us more or less away from life insurance and into banking functions are the result, not so much of the enactment of legislation or of the recommendations of the State insurance officials (as is sometimes implied), as of our own voluntary acts.

PARENTS' RIGHT OF RECOVERY UNDER WORKMEN'S COMPENSATION ACTS

By Malcolm J. Coan,* of the Baltimore Bar

THE following memorandum is presented in order to call the attention of the Bar to the fact that an additional recovery or compensation may be had in a certain class of cases contrary to the apparent scope of the Workmen's Compensation Act as set out in Section 35 of the same, which reads: * * * "and except as in this Act otherwise provided, such payments shall be in lieu of any and all rights of action whatsoever against any person whomsoever."

Similar provisions are contained in the Acts of the other States having Workmen's Compensation Laws.

In spite of the sweeping exclusion of the language of the Act, it is respectfully submitted that whenever the injured workman is a minor, employed without the parent's knowledge or consent, then in addition to the compensation allowed under the Act, there yet remains the right of an action and recovery by the parent.

It is not necessary to emphasize the causes which led up to this character of legislation. Every well read layman as well as every lawyer knows of the frequent miscarriage of justice heretofore resulting through the recognition and application of the outgrown doctrines of contributory negligence, assumption of risk and the fellow servant rule. To remedy that obnoxious condition, so deeply rooted in our jurisprudence, is the purpose and justification of such enactments; yet it is in the philosophy underlying those very rules thus sought to be avoided that we find the basis and reason for the exception, so to speak, to which attention is called. The very reasoning which prevented the application of the rules mentioned in a suit by the parent, while they were vigorously and almost relentlessly applied as against the individual claim of the child, now in the face of the Act prevents it from destroying the right of action accruing to the parent as here referred to.

Parents, as a correlative right to the duties imposed upon them of the maintenance and education of their children, have a right to the custody and welfare of those children. It has been universally held that anyone who employs a child at dangerous work without the knowledge of the parent or against his wishes, commits a breach of that right. And if while so employed the child is injured, the parent can recover for whatever loss of services result therefrom.

In such an action by the parent the doctrines of contributory negligence, assumption of risk and the fellow servant rule would have no application, and the negligence *vel non* of the employer toward such minor employe would be immaterial.

The gist of the offense is the breach of the parent's right to the custody and welfare of the child.

The parent's right to recover in such a suit would not depend on whether or not the child could also recover for his injury in an action by himself against his employer. As in this latter suit by the child the defensive doctrines above enumerated would be applicable if borne out by the facts. And in every such case he would have to show some negligence of the master to himself.

Labatt on Master and Servant, section 21, page 41, says:

"The controlling principle in these cases is that a person who hires an unemancipated minor and puts him at hazardous work is accountable to the non-assenting parent for all the consequences following directly from the employment, in so far as they entail a loss of the minor's services. * * * In such cases the wrong consists essentially in the employment of the minor servant without the permission or against the wishes of the parent. The parent is therefore entitled to recover irrespective of whether the master was negligent. And as the contract of employment is made without his consent, he is a stranger to it and not bound by any of its terms. Not having agreed that his child shall assume the risks incident to the employment, he can recover, although the injury may have been caused by the negligence of the child's fellow servant. Nor is his action barred by the fact that the child was guilty of contributory negligence."

"The case of one who engages from a parent a minor child for the purpose of a particular service is so similar in basal consideration to the case of one who hires a slave, a horse, a chattel or any other thing of value from another for one purpose, and then employs it for another, as to make the general principle applicable in the familiar class of cases last mentioned likewise applicable to the case of the father, when injury has resulted to him from the fact that the son's services were diverted from what the original intention of the contracting parties was that they should be." Braswell v. Garfield Cotton Oil Mill Co., 66 S. E. 539.

"If one knowingly hire a minor and require him to perform dangerous service in opposition to the parent's will, he will be liable to the parent if injury befall such minor while engaged in such service. In such a case it is not a question of negligence that gives rise to the liability, but the wrong consists in opposing the will of the parent." Toledo St. R. Co. v. Trimble, 35 N. E. 716. See also Taylor v. Chesapeake & Ohio R. Co., 41 W. Va. 704; Woodward Iron Co. v. Curl, 153 Ala. 205; Ft. Wayne C. L. R. Co. v. Byerle, 110 Ind. 100.

"If a person puts a minor to work at a dangerous place without the consent of the parent having him in charge, and he is injured, the person is responsible in damages to the parent, without regard to negligence on the one part or contributory negligence on the

other." Marbury Lumber Co. v. Westbrook, 121 Ala. 179. See also L. & N. R. Co. v. Willis, 4 Am. St. Rep. 124; Union News Co. v. Morrow, 46 S. W. 6.

In Garfield Cotton Oil Mill Co. v. Braswell, 66 S. E. 539, the Court said at page 540: "Even in a case where the maxim *volenti non fit injuria* would bar the minor himself from recovering, the defense under the maxim cannot be set up against the father, for the reason that his consent to the risk had not been given."

See also Hendrickson v. L. & N. R. Co., 126 S. W. 117; L. & N. R. Co. v. Willis, 4 Am. St. Rep. 124; Railroad Co. v. Brick, 18 S. W. 947.

Texas & P. Ry. Co. v. Hervey, 89 S. W. 1095, reads: If defendant in employing plaintiff's son without plaintiff's consent, knew that the son was a minor and the service was a dangerous one, and the son was injured thereby, plaintiff could recover, though the proximate cause of the injury was negligence of a fellow servant.

See also Grand Rapids and I. R. Co. v. Showers, 71 Ind. 451; Railroad Co. v. Brick, 18 S. W. 947.

Consent to One Kind of Risk and Child Employed at Different Risk.

Labatt on Master and Servant, Vol. 1, section 21, recognizes the rule.

"The consent of the parent is not available as a justification except so far as it has regard to the particular work to which it applies."

Labatt on Master and Servant, section 21, page 41.

Thus a contract to employment in sacking cotton seeds in a cotton mill is not consent to employment in oiling machinery: Garfield Cotton Oil Mill Co. v. Braswell, 66 S. E. 539; Dimick Pipe Works v. Wood, 35 So. 885; Hillsboro Cotton Mills v. King, 112 S. W. 132.

Conclusion.

Prior to the Act, whenever a child, employed with the parent's consent, was injured through the negligence of the employer, the damages recoverable were twofold. First, the damages recoverable by the child himself for his pain and suffering and permanent impairment and earning capacity after reaching his majority; and, secondly, the damages recoverable by the parent for medical services and attendance and for loss of services until the child reached the age of 21.

The compensation allowed under the Workmen's Compensation Act is intended to be in lieu of both kinds of damages described above. They were damages resulting where an infant were rightfully employed at dangerous work. Any suit that formerly might have been instituted would involve merely the law of Master and Servant, and it would be requisite to show in such suits some breach of duty from the master to the servant, and the defensive doctrines which had arisen under the law of master and servant would be applicable thereto.

The Act, however, was never intended to exempt one employing a child at dangerous work against the parent's wishes or without his knowledge, from the consequences of that wrongful act. Suits of this character were not subject to the defensive doctrines of contributory negligence, assumption of risk and the fellow servant rule, nor was it necessary to show any negligence on the part of the master toward such minor employe. All that was requisite to a recovery in such suits was that the child had been employed at such dangerous work without the parent's knowledge or against his wishes. Hence as to this class of cases the reason for the Act fails.

Surely this Act was never intended to destroy the parent's right to the custoy and welfare of the child. Yet if it be held that a parent cannot in the future sue for a breach of that right this would be the effect of so ruling, because one who places a child at dangerous work against the parent's expressed wishes, would be subject to no more liability than one employing a child at such work with the parent's consent. In other words, employers could violate and infringe upon the parent's common law right to the custody and welfare of their children with impunity, because if the child is injured while so employed the employer could not be sued by the parent, and he would be liable only for the compensation allowed by the Act, to which amount he would have been liable anyway, even if he had obtained the parent's consent to such employment of the child.

Illustration.

If a railroad company against the expressed wishes of a parent places his 19-year-old boy to work as a brakeman and pays him $10 per week, the parent remaining ignorant of the nature of the boy's work, and while so employed an accident occurs in which the boy loses his arm, could the railroad company by paying the sum allowed under the Act, namely, one-half of his wages, or $5 per week, for a period of 200 weeks, escape the further liability to the parent for the loss of services of that child? If the answer is yes, then the parent's common law rights to the custody and welfare of that child have been destroyed by this Act. The payment of that $5 per week is not to compensate that parent for the breach of his common law rights, because if there had been no such breach of his rights and the child had been employed with his consent, that sum would have been allowed anyway.

If, therefore, the Act is held to destroy the parent's right of action, then employers in the future could say: "Don't bother about getting the consent of parent to the employment of children at dangerous work; employ them anyway, for even if the parent protest against the employment of his children at dangerous work, the cost is no greater."

Therefore it is contended that in this class of cases an action at law by the parent can be maintained for loss of services of the minor child in addition to the compensation allowed under the Act.

FIRE INSURANCE AS A BUSINESS NECESSITY

THOSE who are in any way associated with the business of insurance could not but be interested at the rapid spread, during the past year, of the federation movement among insurance men. State after State has been touched by this spirit of the times, and it is worthy of note that in some cases at least the new organization has not merely meant another organization overlapping in its efforts the work of some already formed. The Insurance Federation of Missouri, for example, has, through its secretary, Mr. O. P. Rutledge, undertaken a campaign of common-sense publicity in regard to the necessity for insurance as an adjunct to business. Mr. Rutledge has already issued three letters to the newspapers of Missouri, and these are of such general interest and value that we give two of them in full below.

* * *

First Letter.

Excessive Fire Losses—Insurance Legislation Needed.

In submitting this letter, the first of a series treating various phases of insurance as a business necessity, it is proper to say that The Insurance Federation of Missouri seeks to bring the policyholder, the insurance agent and the insurance company to a fuller realization of the fact that they have a mutual interest in any activity which has for its object the advancement of the general cause of insurance and the protection of that cause against destructive acts or measures, public or private.

A long and interesting story could be written covering the

struggle to pass and repeal laws affecting insurance during the twenty years,—the causes therefor and the consequences thereof, but really "All this water is over the dam" and the culmination last summer in the withdrawal of the fire companies from the State has brought us all to the point where we are intensely interested in the contemplated rearrangement of insurance legislation by the next legislature.

The return of the fire companies to the State was largely brought about by the promise of the Governor and his associates to overhaul the laws affecting insurance and make the situation in Missouri inviting to underwriters instead of uncomfortable and repulsive as it now is. The Governor's attitude is wise. He sees that the way to get cheap insurance in Missouri is to stop the present alarming increase in the fire losses and through fire prevention agitation improve the actual fire risk of the State, thus reducing losses and inevitably bringing cheap insurance. As it is now underwriters are really indifferent to Missouri business because it has been disastrous. Fire and tornado premiums in Missouri in 1912 amounted to $8,636,060. The losses were $6,106,487. Adding the expenses paid in Missouri, such as taxes, agents' commissions, and all administration expense, the companies put into Missouri in 1912 about $800,000 more than they took out. Nor is this exceptional; it has rather been the rule for many years.

Fire insurance men, both managers and agents, look with confidence for a well considered and valuable report from the Governor's commission known as the "Goltra Commission." This commission is composed of men well qualified to understand the problem and to recommend remedies, men who possess the confidence of their State and men who appear disposed to make necessary sacrifice of their time and labor. The citizens of Missouri should feel grateful to them for this service and should see to it that the legislature compensates them for their expenses, at least. When it comes to prophesying what that commission will recommend, of course, one man's opinion is as good as another's. The writer thinks that the commission will be inevitably brought to the same conclusions which have been reached in New York State by a joint committee of the Senate and Assembly, headed by Honorable Edwin A. Merritt, Jr., transmitted to the New York legislature, February 11, 1911, and since then tested and proved by other investigations of the New York Insurance Department. The writer is the more disposed to think this because our own Superintendent Revelle sat in the meetings of the Insurance Commissioners' Association last Fall, where practically the same conclusions were reached. New York State spends about $45,000,000 per year in fire insurance premiums. Missouri spent in 1912, $8,636,060. There is a strong presumption that the laws which have been found wise in a State which is such a large user of insurance will be the best for Missouri.

Large buyers of fire insurance in Missouri, such as merchants, manufacturers, grain men, lumber men, etc., may well take time to appear before the next legislature and express the hope that its enactments may make such changes in the Missouri laws as will take Missouri out of the group of States which try experiments on the insurance business. Unquestionably the best interest of all buyers of insurance lies in securing insurance laws that will place the business on a solid basis of well tried ideas,—tested by experience in the oldest communities where the working of the laws can be studied and the public contentment measured without difficulty. Let us put Missouri high in national estimation as regards insurance legislation. Such approval affects the inflow of capital as well as the comfortable and economical transaction of the insurance business in our State. Don't let us be afraid of going too far in this direction. We have some adverse opinions to erase. Succeeding legislatures can easily make any changes which may appear advisable after trying out the new body of law.

third. Fire losses increased one-half, and that, too, in spite of In the last ten years insurance values have increased about one-third. Fire losses increase one-half, and that, too, in spite of the fact that the fire loss in the City of St. Louis has remained practically stationary for twenty-five years, though its insurable values have doubled, and in some instances trebled. The non-burning, careful business man pays for the careless, indifferent, reckless builder and occupant. Get this truth in the minds of Missourians and they will demand to have a State fire marshal set at work with ample powers to control the man who insists on imperiling the savings of his careful neighbors. If insurance rates are made by a just and sensible schedule based on actual facts and elements of hazard, applied impartially to everyone, entirely open to the public view and under the general care and supervision of the Missouri Insurance Department (which should be charged with authority to abate unjust discriminations) then the good risks would be rewarded by the low rates and the bad risks would have to make themselves into good risks or pay their fair proportion of contribution to the common insurance fund of the citizens of Missouri. No monopoly need ever be feared. Too many forms of competing fire insurance, such as Farm Mutuals, Town Mutuals, Mill, Factory, Lumber Mutuals and Indemnity Exchanges will always be available to the public. In general what the insurance reform needs is a changed opinion on the part of the premium payer. Fire insurance is not external to the premium payers. It is their own mutual machinery for taking care of the loss of each by the contribution of all. Spread this opinion among Missouri premium payers and they will not view with favor any unwise legislative tampering with the citizens' interest in this, their own business.

Second Letter.

Fire Insurance—Its Relation to Incendiarism; the Need of a Fire Marshal.

Until the early years of the nineteenth century the fire insurance companies maintained at their own expense trained fire departments and salvage corps in all large centres, whose sole duty it was to guard against and extinguish fires and protect property from damage by fire, water and smoke. This service gradually became specialized and eventuality the municipalities absorbed the expense of maintaining the fire departments, and the companies relinquished the control of them. The companies still maintain in large cities well organized salvage corps.

These trained fire fighters have on their own account devoted years of study and observation to the various causes and motives originating fires and the influence which fire insurance may have upon such causes and motives. It has been learned definitely that there are three factors which enter into all fires connected with human agency, and the extent of loss resulting therefrom, which are defined as:

First—Physical Hazard.

Second—Moral Hazard.

Third—Temperamental Hazard.

By the term "Physical Hazard" is meant all causes which are inherent to inflammable property and its use, such as construction, chemical hazards, hazards of machinery, heating, lightning and all other causes, the origin of which is not easily preventable or readily discerned.

By "Moral Hazard" we mean the production or increase of loss from intentional causes, including fires induced from motives of revenge, insanity or to conceal crime or secure unlawful gain.

By "Temperamental Hazard" we mean that state of mind which excuses carelessness as respects the causes which produce fire, indifference as to the effects which follow or the remedy which may be applied for the prevention of fires. Between those fires which with reasonable care can scarcely be avoided and those which are intentionally caused from various motives we place that enormous volume of fire losses not purposely caused but which could be prevented. It is this class of fires which are classified under "Temperamental Hazard."

The relation of fire insurance to incendiarism is usually found in connection with the second cause referred to above, that is, "Moral Hazard"—as regards its influence upon the production of fires for unlawful gain. Our investigation of this subject has led us to conclude that there are a great number of losses charged up in the popular mind as incendiary which should not be so classified, and our conclusions are based upon a study of the following motives from which spring all intentionally produced fires, namely:

First—Motives of revenge or spite.

Second—Insanity, weakmindedneess, drunkenness or mania for excitement.

Third—To cover up evidence of crime, theft or murder.

Fourth—To collect insurance money.

It will be noted that out of the four motives enumerated only one, the last, has any bearing upon the subject under discussion. This is the only motive that has any relation to fire insurance. It is to be regretted that it has been impossible to determine with accuracy how many fires in a given period of time are chargeable to "physical hazard"—how many to recklessness and indifference and how many to criminal intention. Could we do this we would soon have conclusions of great value, but this information is practically impossible of tabulation, as the successful demonstration of the causes of all fires is rendered futile because generally the fire destroys the history of its origin.

The public has been impressed in various ways that from 25 per cent to 50 per cent of the fires in the State are of incendiary origin. It is extremely difficult to prove such charges, but it is comparatively easy to disprove such estimates, as the following will show. Few States publish in detail specific information as to the total number of fires, the number reported as "cause unknown" and as "incendiary," which, please bear in mind, is divisible into four motives, only one of which has any reference to fire insurance. Such fragmentary information as we have enables us to group:

Massachusetts for the years 1908-1912, inclusive;
West Virginia for the years 1911-1912, inclusive;
Michigan for the year 1911;
Ohio for the years 1908-1911;
Kentucky for the years 1907-1908, inclusive;
Wisconsin for the years 1910-1911, inclusive;
Lousiana for the year 1912;
Illinois for the year 1912;
Nebraska for the year 1912.

These States have tabulated the fires occurring within their bounds for the years mentioned, and we find a total of 76,997 fires, of which number 2,283 (a ratio of total 2.97 per cent) are classified as "suspicious" or "incendiary," and 10,467 (ratio of total 13.59 per cent) are classified as "cause unknown." In these figures all fires reported as suspicious are classified as incendiary. This tabulation of all fire losses suggests the advisability of Missouri having some officer of the State empowered to investigate all fires.

New York State, including Greater New York City, is the heaviest patron of insurance in this country, and it is to be regretted that we have no figures showing the number of fires in the State, but the figures of Greater New York City are available. We find that in the years 1910, 1911 and 1912 there were 43,906 fires in that great city, of which 1946 (ratio of total 4.42 per cent) are classified as "suspicious," or "incendiary," while 12,020 (ratio of total 27.37 per cent) are entered as "cause unknown"—including Greater New York, the published number of fires for 1914, covering the entire United States and Canada, is 120,903. Of this number 4,229 (ratio total 3.49 per cent) are classified as "suspicious," or "incendiary," and 22,487 (ratio of total 18.59 per cent) are classified as "cause unknown."

From the foregoing we are justified in assuming that the number of suspicious or incendiary fires of all kinds does not exceed at this time a percentage of 5 per cent of the whole, if we add half of the "cause unknown" fires and class them as "incendiary," which comes very near the truth. The year 1912, according to the "Journal of Commerce," of New York, showed a total fire loss in the United States and Canada amounting to $225,321,000; of this amount 13 per cent, or $29,291,430, is shown to be due to incendiarism, but this figure embraces the four motives of revenge, insanity, crime and wrongful gain from insurance, as the exciting cause. Now, what proportion of the 13 per cent of the total fire loss owes its origin to fire insurance? So far as known the only States which undertake to tabulate the motives of incendiary losses are Massachusetts, West Virginia and Ohio. In 1912 there were 1,320 incendiary fires recorded in the three States named, classified as follows: Revenge, 351; unknown cause, 508; insanity, 167; crime or drink, 36; for insurance, 258. It will be seen that 38.5 per cent of all incendiary fires are from unknown causes and 19.5 per cent have insurance imputed as the motive. If we add half of the motive "unknown," or 19.5 per cent more, we have 38.5 per cent as a fairly correct factor to be applied in computing incendiary fires within the States named. We have shown that $29,291,430 is approximately the total sum of incendiary loss in the United States and Canada. If now we take 38.5 per cent of that sum we have $11,277,200 as the probable incendiary fire loss, or a ratio of 5 per cent of the total estimates for all losses for the year 1912 in this country and Canada.

We are unable to estimate the incendiary fires in Missouri for the reason that the State does not keep a record of fire losses and their cause, but we can safely figure purely incendiary fires as amounting to $1,125,000 per year. Incendiarism is sporadic and occasional rather than universally epidemic. The crime is largely confined to large cities, which offer the greatest opportunites at the hand of a mixed population gathered from the four corners of the earth, a great number of whom are criminal. In States having a fire marshal clothed with police powers, who conduct their office with a view to real efficiency in the enforcement of the law, great numbers of the population are found to be heavily overinsured. Overinsurance is very common, but it is not always to be construed as having been effected from sinister motives, but rather, the motives may be:

First—Honest overvaluation of property from failure to understand the effects of age, depreciation, wear and tear.

Second—Fluctuations in quantities of merchandise or from changes in market value.

Third—Intentional overvaluation for criminal ends.

In the light of modern analysis by insurance experts and fire marshals, the sober opinion has been formed and published that in a large number of cases of loss the amount of insurance was within the values insured. There are enough incendiary and unknown causes of fires, however, in Missouri, to justify the creation

of the office of fire marshal, as his duties will not be confined to the investigation of suspicious fires only, but to all fires, and the promulgation of acts respecting the construction and care of property—practical fire prevention.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Report of War Risk Bureau.—The report of Mr. W. C. De Lanoy, Director of the Bureau of War Risk Insurance of the Treasury Department, contains a financial statement covering the operations of the Bureau from the date of its organization up to December 1. It is as follows:

Total amount of insurance written, Sept. 2 to Dec. 1, 1914..	$15,251,261.00
Premiums for which were	298,759.39
Losses paid to date	None
All expenses of bureau, including organization and salaries	3,874.17
Net receipts in excess of expenditures	$294,885.22
Appropriation for expenses of bureau	100,000.00
Expenses as above	3,874.17
Amount of appropriation remaining	$96,125.83
Appropriation for payment of losses	5,000,000.00
Claims for losses reported, estimated	5,000.00

* * *

Common Sense and the Cost of Fire Insurance.—Commissioner Epsteen, of Colorado, has recently issued a pamphlet entitled "Fire Waste." In it he has undertaken to put the figures of fire waste and fire insurance cost in the United States on a truly comparative basis with the much quoted figures of several European countries. His results are so striking that they are quoted below:

"The fire waste in the United States is about $500,000 a day. It is extraordinarily high compared with that of any other civilized nation. The following table shows the fire loss per $100 of insurance:

	Cents.
United States	64
England	27½
Norway	24
Sweden	21
Austria-Hungary	16
Germany	12

"From this one can see that the fire loss in the United States per $100 of insured property is more than twice that of England and more than five times that of Germany.

"If the fire waste of the United States were as low as that of Germany, our insurance rates would be lower than theirs. As the foregoing table shows, the fire loss in Germany is 12 cents per $100 of insurance. To take care of this 12-cent loss, the German rate is 22½ cents; to take care of the 64-cent loss in the United States, the rate charged is $1.11. Now, to get a proper comparison of these rates, it is necessary to multiply the German loss and rate by 5⅓ to have it upon the United States basis of 64 cents of loss. This makes the German rate $1.20, as against the $1.11 in the United States. Plainly, therefore, the rate in the United States is 9 cents lower than in Germany, if the losses are put upon the same basis.

"We may look at the same situation from a different angle. In Germany it costs 10½ cents to take care of the 22½-cent rate; the expense ratio is therefore 47 per cent. In the United States it costs 47 cents to take care of the $1.11; the expense ratio is therefore 42 per cent. Thus we see that, taken as a whole, the fire insurance business is more economically managed in the United States than in Germany, the difference being 5 per cent in our favor.

"Indeed, considering all the facts, fire insurance rates cannot be said to be unreasonably high. Some companies make money and some companies lose money; some States are profitable and some States are unprofitable. Taken as a whole, the experience in the United States shows that the average annual underwriting profit is only about 2½ per cent. I know of no other line of business which contents itself with such a modest return.

"Fair play and common sense demand that we face the facts squarely, even if they are distasteful. It should therefore be frankly acknowledged that the chief reason for high rates at the present time is the enormous fire waste which exists throughout the country. In Colorado alone we destroyed last year $1,000,000 worth of property by fires; a considerable portion of this was due to negligence and was entirely avoidable. Therefore, if we want the rate reduced, we should begin by exercising greater care, and thus reducing the number of fires and the amount of property needlessly burned."

* * *

Valuation of Insurance Companies' Securities.—The Committee on Valuation of Securities of the National Convention of Insurance Commissioners has been successful in securing the consent of the convention to have June 30, 1914, security valuations accepted in all States as the basis which insurance companies other than life shall use in compiling their annual statements.

In its report, submitted to the convention, the committee gave the following outline of the reasons which led to the adoption of this plan:

"When the expert employed by the National Convention, and the representatives of the New York department co-operating with him, began making preparations for the valuation pamphlet they found themselves facing an unprecedented condition. On July 24, when the ultimatum to Servia was sent, market values were as high, if not higher, than at any other time during the year. On July 30, less than a week later, values had fallen so low and the market had become so demoralized that a panic of unknown proportions was only averted by closing the Stock Exchanges of the country and the world. The liquidation, coming suddenly, only active securities dropped. Inactive stocks and bonds, since they were only occasionally dealt in, failed to reflect the violent decline. To add to the complications, out of this stagnation of the stock and bond market arose unofficial and unprotected markets dealing in securities, both listed and unlisted, at materially lower levels than the closing prices.

"If the committee should undertake to value as of December 31, 1914, the quotations of municipal and inactive securities, failing as they did to reflect the decline of the last week of the Exchange, would actually be valuations as of July 24. The quotations of listed securities would be as of July 30, the closing day of the Exchange. On the other hand, the quotations of other securities that happened to be dealt in after July 30 would be as of various dates subsequent thereto. Here also would arise a complication. How could the committee recognize transactions in these unlisted securities subsequent to July 30 while declining to recognize the many unofficial transactions in listed securities that it is common knowledge are continually occurring? It was obviously impossible to undertake valuing as of December 31, 1914. It also was evident that valuations as of July 30, the closing day of the Exchange, would not be uniform, but would discriminate against active securities, recording in such cases abnormally low quotations that fail to represent actual values while recording for municipal and inactive securities the higher valuation as of July 24.

"It became evident that we were facing a situation similar although more serious and complicated than that of 1907, when

the 'average of 13' was adopted. To delay action until the adjourned meeting of the convention was impossible, since it was necessary for Mr. Scudder to know what information to solicit before he could begin work on the form letters to be sent to numerous brokers, bankers and other correspondents. The feasible and also the conservative proposition appeared to be to adopt June 30 valuations, the midyear date, when conditions were still normal. Accordingly a circular letter under date of September 30, 1914, a copy of which is attached, was sent to the officers of the convention, members of the Committee on Valuation of Securities and members of the Executive Committee, calling attention to the fact that in view of existing conditions in the financial world it was impracticable, if not impossible, to obtain quotations as of December 31, 1914."

INSURANCE NEWS IN THE WEST

Decision on the Constitutionality of the Kentucky Compensation Act.—The decision of the Kentucky Court of Appeals last Friday declaring the Workmen's Compensation Act unconstitutional has upset the casualty situation in the State very badly. The court divided four to three on the question. The majority, in effect, ruled that the elective features penalized the employer and the employe who elected not to come under the law so severely as virtually to compel them to come under the law, and, that this being true the agreement they made as to compensation was not a free contract. A large amount of business had been written, much of it on employers who had not previously carried liability insurance. Most of this now goes for naught. There can be little question that until Kentucky does get a valid compensation law it will be a bad State in which to do liability insurance, as the employes now expect compensation for all injuries and juries will regard it as the policy of the State that all injuries should be compensated, although a court decision or peculiar constitutional provisions prevented the carrying out of this policy.

Report on Potts' Investigation of Fire Insurance.—Insurance Superintendent Rufus M. Potts of Illinois last week released for publication his report to the Governor of his investigation of fire insurance rates and conditions in the State. It was about what was to be expected from the hostile attitude toward the companies that Judge Potts has assumed for some months past.

The report shows a large amount of work—investigation into insurance history, plans of insurance abroad, inquiry into rates and rating systems, marshalling of all material that could be used to make fire insurance companies look like robbers and undesirable citizens generally. The recommendations are that Illinois establish a system of State insurance, or at least that it take strict supervision over rates.

If the report were not so venomous, one might infer that Judge Potts' investigations had convinced him of the desirability or necessity of State insurance. As it is, the impression left by reading the report is that he started with a desire to get State insurance and sought material which might assist in converting the public to his view.

It would be entirely unfair not to give the Superinendent credit for presenting valuable information and pointing out abuses that need correction, which, in fact, will keep the companies in a stew until they are corrected. For example, the old iniquity of preferred rates in Chicago is shown up in figures. No living man can justify the difference between a 75-cent rate in Cook County and a 40-cent rate outside on similar risks. One or the other is wrong; perhaps both are. There are statistics of the business in Illinois and comparisons of rates in Illinois and other States which certainly do not prove that Illinois has been a poor State for the companies, as compared with its neighbors.

But Judge Potts' desire to make a case against the companies has led him at times into inconsistencies, to say nothing of unfair assertions. He attributes the low rates in Continental Europe largely to the existence of State fire insurance and refers to the small use of wood in buildings as the "excuse alleged by the insurance companies." Yet, elsewehere in the report, he belittles the danger of another conflagration in Chicago. He says that when the conflagration of 1871 occurred a great majority of the buildings were of wooden construction in congested areas, while, in contrast, he says, "Fires will occur, but they cannot spread among brick and stone buildings of modern construction with modern fire protection." He condemns the companies for the evil of overinsurance, and says that State insurance tends to the enactment of laws to curtail this evil. Yet he proposes that if the companies are to be permitted to do business in Illinois they should "be required to grant insurance at regular rates for the class to which the risk belongs to any applicant in the same way that a common carrier must transport, or a hotelkeeper must give lodgings to any decent person." He would, however, allow companies to refuse risks for "substantial reasons proven in court." He would also forbid cancellation except for reasons proven in court. Thus either to avoid writing overinsurance, if one demanded it, the companies would have to go into court; or, if they found that property was overinsured, they would have to go to court to secure the right to cancel.

Judge Potts would not permit coinsurance. He believes that the citizen who helps support the Fire Department and wants to take a chance by insuring his property for only part of its value, and trust to the Fire Department to extinguish the fire before the uninsured fraction is burned, should be permitted to do so without being penalized by a coinsurance clause.

The comments on agents' qualification requirements are thoroughly sound. He says that the absence of any requirements of qualifications in Illinois has as a natural result "that a certain proportion of insurance agents are incompetent and their work perilous to the insuring public." He recommends enactment of the salient features of recommendations on agency qualifications made by the Illinois Association of Insurance Agents. Judge Potts' criticisms of the practice of writing large lines and reinsuring in foreign companies is in line with what some of the best underwriters have said on the same subject. His charge of insincerity on the part of the companies in their fire prevention work is unjust. The question of what constitutes a fair profit is one on which good men differ. Judge Potts is probably as near right in holding that profits should be based upon the capital stock regardless of the volume of business done as some underwriters have been in claiming that rates should be so adjusted as to return a 10 per cent underwriting profit besides the banking profit.

If in his eagerness to make a case against the companies, Judge Potts had not acted as a special pleader but had presented the calm result of a judicial investigation of a big subject, he would have presented a more convincing paper to the thinking public. Possibly, however, such a report would not have been given the scare head publicity this one has received, nor created as much demand for legislation of some sort as this one may prove to have created. Some of the alleged abuses he has pointed out are not abuses at all, but are real advantages to the public. Some are the children of a vivid imagination. Some, however, are real, such as rate discriminations, overinsurance and unfit agents, and their correction or elimination is needed.

Chicago, December 18, 1914.

FINANCE AND COMMERCE

Financial and Commercial Review
Banking Situation at Home and Abroad
Statistics of Cotton and Coffee
Market Prices of Securities and Commodities

WHETHER or not it was the prelude to important naval operations, the spectacular raid on the English coast made by German warships was the signal event of the past week from the business and financial viewpoint. A succession of events is required in order to place any one of them in its proper relation, but this particular exploit seemed to add to the reasons for believing that the European War may terminate sooner than the most optimistic have dared to hope. Something may be going on beneath the surface of the political world which warrants such expectations, for a striking feature of the advices from foreign financial centres lately has been the suggestion of a growing opinion that military operations would not long survive the winter, however protracted the peace negotiations thereafter.

It is not safe to trust such suggestions just now because of the unconscious logic of hope which smuggles itself into the realm of the intellect, but if one were to admit facts to the reckoning some support for an argument based on the desperation of Germany's position would be furnished. Certainly the naval raid on British shores had all the characteristics of a most desperate undertaking. From a military point of view, it could by itself accomplish nothing of any advantage to Germany. Indeed, it has been already disadvantageous in the stimulus which it has administered to recruiting for the British army. The raid effectually angered John Bull and insures larger reinforcements for the huge forces with which the Allies will be ready to engage in active operations next Spring. Regarded as a venture of desperation, it fits in with other things which imply that Germany is wildly trying every expedient which can be devised for the advancement of German interests, but resort to which only exposes the extremity of the German situation.

The effort to arouse the Moslem world to arms falls in this category. So does the new line of German diplomatic negotiations with Italy. So also does the latest shift of the German campaign in this country. Could anything be more illuminating than the mevement openly started and fostered under the so-called German-American auspices to secure legislation at Washington placing an embargo on what is called war business? The pretense that this movement is guided solely by pacific considerations and in accordance with the ideal of American neutrality is utterly flimsy. It aims to apply to Congress the political pressure represented by the large German-American vote, but the attempt to place the United States in the ranks of Germany's allies is too thinly veiled to promise for it any success. What is of more consequence is the disclosure which it makes of the impulses which are guiding German action, impulses which must derive from an unacknowledged appreciation of the losing character of the German cause in the war.

Possibly it was this which prevented the German naval raid from reflecting itself in any apprehensive excitement of the only important securities markets now open in the world,—that conducted on the New York Stock Exchange. The market turned dull, but no more satisfactory assurance could have been given of the extent to which the financial community here and abroad has recovered from panic or tendencies to panic. The restoration of the full Stock Exchange list to open trading was one of the major financial developments of the week, and the outcomes have been wholly gratifying. There appears to be no great desire to sell securities, and the market has all the signs of being excessively sold out on the speculative side. Bankers are preaching the utmost conservatism and no sanction is lent for speculative campaigning to advance prices, but the portents of quoted values are auspicious for general business. The deduction to which they lend themselves is that affairs are in excellent shape for improvement if an important impetus is supplied.

This may come from happenings in the war. It may come from the Interstate Commerce Commission's decision in the Eastern railroad rate case. This is the big factor to which Wall Street has been looking forward for many weeks. According to the nature of the decision a great deal of harm may be done, or a great deal of help given to a financial and commercial situation which is sensitive to occurrences of a sentiment-making sort. If the decision can be favorably interpreted by corporate finance, it is likely that widespread wage reductions may be averted and a large increase of unemployment prevented. In its negative bearings a decision favorable to the railroads will save much trouble. In its positive bearings it can hardly fail to be beneficial. Railroad credit will be strengthened and much imperative new financing and refinancing will be facilitated, while at the same time a large amount of railroad contracts for equipment and materials will be placed and communicate recovering influences to all branches of business.

The money market is propitious for any better movement in trade and industry as well as for the betterment of values. The ample supply of credit in sight can be made to do very effective duty as a temporary substitute for ample supplies of capital in the building up of enterprise, and while commerce is in a state of severe contraction business is not altogether prostrated. The foreign trade which the country is doing continues to expand, and November yielded an export balance of $79,000,000, compared with an export balance of $57,000,000 in October.

Of all the questions made more or less academic by current conditions, but having a momentous forward bearing, none are more interesting than those raised by the establishment of the new Federal Reserve banking system. It still remains to be proved how this system is going to get itself into business and how business is going to get into the Federal Reserve Banks, and how all this is going to be achieved without constructive or actual amendment of the statutory law of the Federal Reserve system's being. The advent of the Federal Reserve institutions inaugurated a brief honeymoon season of rejoicing over the insurance afforded against panic and the potentialities of inflation contained in the new organization, but the honeymoon is ended.

Discerning observers are already beginning to ask how the Reserve Banks are going to work to earn enough to pay expenses, and how their workings are to be reconciled with prevailing customs and conditions. The note of criticism, which had been very much suppressed since the passage of the Federal Reserve Act a year ago, is being struck again, and it is worth while to bear in mind that the Act itself contained numerous defects which Congress and the Administration stubbornly refused to recognize.

The Federal Reserve system was designed to cope with panic and deal with strain. It was not designed to assist and control the normal functions of finance. One of the tasks of the Federal Reserve Board and of the Federal Reserve Bank Directors and Governors and of the Federal Advisory Council will be to promulgate policies which in practice are sufficiently amendatory of the Federal Reserve Act to correct this inherent and fundamental defect. Their task is not made any easier by the difficulty of avoiding a clash, on the one hand, with the political power denoted by the Treasury influence in the system, and, on the other, with

25,000 and more National and State banking institutions, which will resent anything resembling Federal Reserve competition in their business. A grotesque uniformity of rediscount rates has already been aimed at, but this is not immediately disturbing because the real money market is easier than the official market, but it is not hard to perceive in the manipulation of rediscount rates to date what a pernicious effect the Treasury is likely to have upon the Federal Reserve system as a result of the Congressional refusal to direct the deposit of Government funds in the new reserve banks and make them the fiscal agents of the United States. Thanks to the paramountcy accorded to it, the Treasury has the same power which Andrew Jackson had to break the United States Bank, for the Treasury can distribute and withdraw public funds in a manner absolutely destructive of sound administration of the reserve banking system.

About as significant a test of the policies which are to control the Federal Reserve Board is likely to be made by the solution of the problem presented by the relation of State banking institutions to the Federal Reserve organization. The Federal Reserve Act provides for the admission of membership of banks with State charters, but so far State bankers have been unable to see that membership in the system would confer compensating gains to offset the loss of advantages which they would be compelled to forego by compliance with the Act. The danger is that political dictates will be heeded and that a lead will be taken from the successful coercion practiced by Congress in forcing the National banks to subscribe to the provisions of the revised National banking law.

Assuming that the Federal Reserve Banks are gradually able to get into business in the course of the next few months, certain features of the system might give the National banks a competitive upperhand over State banks and trust companies, as, for example, in the free collection of checks for member banks by the Federal Reserve Banks. If the privilege of such collections is refused to State banks, which might avail themselves of it through connections with member banks, such a refusal would be distinctly an effort to coerce State banks into becoming Federal Reserve members. Now precisely some such coercion has already been intimated as possible, and State banks have begun to take alarm over the prospect, so much so that in New York an inquiry has been started among bankers doing business under State charter with a view to forming a combination to resist Federal aggression.

BROAD STREET.

AMERICAN AND FOREIGN BANK STATEMENTS

NEW YORK BANKING INSTITUTIONS.

The third weekly statement of the New York Clearing House banks and trust companies, under the new form adopted upon the establishment of the Federal Reserve System, showed a further decline in the amount of excess reserve of $7,689,900.

FEDERAL RESERVE BANKS.

The statement issued on December 11 by the Federal Reserve Board showed loans and discounts during the previous week by all of the twelve reserve banks. An increase of approximately $1,600,000 was shown in circulation, though the net liability of the reserve banks theeron decreased owing to the substitution of gold for paper previously in the hands of the reserve agents. Bills discounted showed an increase of slightly more than $400,000. Of the paper in the hands of the banks, 63 per cent had a thirty-day maturity.

FOREIGN BANK STATEMENTS.

The weekly bank statements of both England and Germany indicate that, for the present at least, the best position possible under the circumstances has been reached in both countries. The slight increase of gold in the Bank of England which was reported for the week of December 10, following three weeks of gradual decline in gold, was continued during the week ending December 17. The increase reported was £961,328. The slight decrease in circulation, noted during the previous fortnight was also continued during the week of December 17.

The Imperial Bank of Germany reported a slight decrease in gold and silver holdings, and a small increase in circulation. Detailed statements follow:

FOREIGN EXCHANGE.

The increased supply of cotton bills is generally assigned as the reason for the weaker tendency of sterling exchange at the close of the week. The "Journal of Commerce" reported on Friday a movement of 107,311 bales from all ports for the previous day, the largest total for the season.

A steady downward movement in francs is reported to have been due to the establishment of additional credits in this country by the French Government. Reichsmarks continued their steady decline throughout the week.

British Trade in November.—The British Board of Trade has issued its monthly summary of foreign trade. Imports for the month amounted to nearly £56,000,000, an increase of approximately £4,500,000 over the imports during October of this year. While this total is £12,000,000 below the import total of November, 1913, it nevertheless continues the steady progress in volume of British imports which has taken place since the low water mark for this year, £42,000,000, was reached in August, 1914.

Exports did not make so good a showing. They amounted to slightly more than £32,500,000, a falling off of £5,500,000 from the value of October exports, and of £1,000,000 from the value of September exports, although they were £4,000,000 in excess of the value for August. The export figure for the corresponding month in 1913 was £20,000,000 in excess of the value of November, 1914, exports.

The following table shows the British 1914 trade movement for six months with comparisons with the same months of 1913 and 1912, together with the totals for the first eleven months of each year:

Imports.	1914.	1913.	1912.
November	£55,900,918	£68,480,918	£70,995,218
October	51,562,000	71,732,893	71,022,511
September	45,056,086	61,359,086	57,184,788
August	42,362,034	55,975,704	59,686,976
July	59,383,792	61,783,683	58,304,351
June	58,272,042	58,309,519	54,629,817
Exports.			
November	32,606,807	52,756,807	48,820,620
October	38,158,000	56,178,843	58,378,706
September	33,527,877	49,277,877	51,239,257
August	28,631,104	52,261,228	53,736,481
July	52,231,296	55,475,551	49,080,029
June	48,626,410	51,377,685	40,710,880
Eleven Months.			
Imports	629,915,395	697,931,963	670,875,028
Exports	495,933,048	582,061,691	548,570,962

Immigration in October.—The Bureau of Immigration has issued its monthly bulletin covering immigration and emigration for the month of October, 1914. The total passenger movement for the month showed a net balance in favor of immigration of 5,831, as against 9,867 for September. The number of immigrant aliens admitted was 30,416, as against 29,143 in September; while emigrant aliens numbered 20,046 in October, as against 18,212 during the previous month. Non-immigrant aliens numbered 14,825, as against 15,481 in September, while non-emigrant aliens reached the total of 19,364 in October, as against 16,545 in September.

The following table shows the numbers of immigrant aliens admitted by months since July of the current year, with comparisons with corresponding months in 1913 and 1912:

	1914.	1913.	1912.
October	30,416	134,140	108,300
September	29,143	136,247	105,611
August	37,706	126,180	82,377
July	60,377	138,244	78,101

COTTON

December 19, 1914.

BELIEF in present prices for cotton, as representative of what both the producers and the cotton trade generally conceive to be its worth with all the existing price-making factors taken into account, has been greatly strengthened by the action of the markets during the past week. The estimate of the season's yield issued last week by the Department of Agriculture, by reason of its overwhelming size, decidedly shook the faith of not a few, not merely in any possible advance in prices this year, but even in the maintenance of the present level of prices. Many who had commitments on the long side promptly liquidated them, and for several days the impression produced by the markets was one of uncertainty and possible top-heaviness. Naturally there was some decline; but this extended less than one-half a cent per pound at the most. Early this week signs of recovering tone began to show themselves, and it was not long before the lost ground was beginning to be regained and prices were once more returning to the level of just before the issue of the Government report. Yesterday, decided strength obtained in all the contract markets, despite the news of the operations of the German fleet against the East coast of England, and the resulting tie-up of British shipping on instructions from the British Admiralty. The closing prices of future contracts in New York yesterday were higher than those of Friday, a week ago, by about $1.50 per bale for the old crop positions and by nearly $2.50 per bale for October, 1915. More important still, they were about $2.00 per bale higher than on the corresponding date in 1904, when there was a bumper crop (though 3,000,000 bales smaller than the present one), but no war, no present or prospective reduction in consumption, no restriction of the free movement of cotton for export to all the cotton-consuming countries of the world. Gratifying and encouraging as all this is, it must be admitted that for no inconsiderable number of persons there is a certain amount of puzzlement about it. These persons grant that that there are some reasons why owners of cotton should feel that the turning point of anxiety has been passed and that they can count upon at least a reasonable market for their cotton in the not distant future. The export movement, for instance, has during the past fortnight assumed almost its normal proportions for the time of year. Then, reports from Lancashire are losing the extreme pessimism, which characterized them in September and October. More business is doing among the English spinners, more enquiry for goods for future months is noted, more cotton is being taken from the the Liverpool stock, and there is every appearance that things are on the mend. Similarly, American manufacturers are beginning to take a less gloomy view of their situation, as they gradually work off their high-priced ante-bellum cotton and have less vividly impressed upon their minds the losses they have had to bear. The demand for their goods is not what they would like and prices for goods are by no means highly remunerative; yet they are getting down to the new low level of values, both for raw material and for goods, and are seeing some chance of moderate profit upon the season's run as a whole. As the Census Bureau's report on consumption, issued on Monday, shows the rate of consumption in the United States since August 1 has declined suprisingly little, in view of all the conditions. The difference between the 1,843,064 bales consumed between August 1 and December 1, 1913, and the 1,671,663 bales consumed in the same period this year is too small to be indicative of a real set-back to the consumption of cotton goods in this country. On the contrary, it would appear far from impossible that the gradual restoration of business activity will make the consumption of the last eight months of the season of 1914-1915 more than make good the loss of the first four months. There is no doubt that all these things are substantial grounds for encouragement about the future course of prices for cotton. Nevertheless, as suggested above, there are not a few persons who cannot rid their minds of apprehension lest the bases of present market calculations should in the end prove to be unwarranted. To these persons the fact appears inescapable that, whoever holds the cotton and wherever it is held, there is an enormously superabundant supply of it in the United States. This is the certainty, while improving business, a coming decrease of acreage, the continued resolution of farmers, the world's financial ability to finance for a long period an unwieldy surplus, the prospective readiness of spinners to contract largely for future needs, etc., are all uncertainties, unlikely in the long run to determine the course of events. That there is weight in these considerations cannot be denied. And yet there may be something in the situation, a hidden influence or force, which is not dreamed of in the philosophy of such doubters. It is a strange fact that wars and their after-effects have almost without exception confounded the prognostications of the infirm of heart. It is not the rule that wars, however great for their time, are followed by world-wide economic prostration. On the contrary, they are followed by world-wide economic activity and expansion, even though an element of fallacy be subsequently disclosed in the apparent swift recovery and advance. And those strange things, markets, have a way of foreshadowing what is to come. The collective whole of a market seems to have a prescience of the future which is denied to the individual member of the market. Perehaps some such phenomenon is manifesting itself in the cotton markets to-day, and is over-riding all the arguments derived from the visible facts.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The following were the high, low and closing bid prices for each delivery, in cents and hundredths of a cent per pound, gross weight:

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	507,876	364,772	341,924	424,264
Overland to mills and Canada	48,775	52,670	51,475	49,073
So. mill takings, est., exclusive of takings from Southern ports.	100,000	100,000	105,000	90,000
Gain of stocks at interior towns	11,688	26,841	27,966	39,315
Brought into sight for week	668,339	544,283	526,365	602,652
Total Movement—				
Port receipts	7,107,192	6,891,075	6,616,297	3,896,504
Overland to mills and Canada	415,677	490,864	559,128	381,659
Southern mill takings..	1,332,032	1,305,873	1,369,796	937,887
Stocks at interior towns in excess of Sept. 1..	772,085	640,248	710,326	1,049,196
Brought into sight thus far this season	9,656,986	9,328,060	9,255,547	6,265,246

The total crop movement is respectively for 144 days, 142 days, 141 days and 140 days.

CENSUS BUREAU REPORT ON CONSUMPTION AND DISTRIBUTION OF COTTON IN NOVEMBER.

On Monday, December 14, the United States Census Bureau issued its monthly cotton supply report, giving the consumption, distribution and supply of cotton in the United States for November, 1914. The figures, with comparisons for November, 1913, are given in the following tables,—round bales being counted as half-bales and bales imported from foreign countries being reduced to equivalent 500-pound bales (net weight):

CONSUMPTION AND ACTIVE SPINDLES IN OCTOBER.

	Consumption		Active Spindles	
	1913, Bales.	1914, Bales.	1913, No.	1914, No.
In mills in the Cotton States	244,546	236,367	12,090,701	12,337,142
In mills in all other States	211,810	184,296	18,858,636	18,104,173
Totals	456,356	*420,663	30,949,337	30,441,315

*Includes 13,515 bales of foreign cotton.

STOCKS OF COTTON IN MILLS AND IN WAREHOUSES ON NOV. 30.

	In Manufacturers' Establishments		In Independent Warehouses	
	1913, Bales.	1914, Bales.	1913, Bales.	1914, Bales.
In the Cotton States	816,337	558,812	3,171,570	4,871,276
In all other States	610,301	501,953	94,144	131,098
Totals for United States	1,4326,638	†1,060,765	3,262,714	‡5,008,374

†Includes 47,577 bales of foreign cotton.
‡Includes 8,862 bales of foreign cotton.

Figures for the consumption of cotton in the United States for the four months ended November 30, 1914, with comparisons for the same period in 1913, are as follows:

CONSUMPTION OF COTTON IN THE UNITED STATES FOR THREE MONTHS ENDED NOVEMBER 30.

	1913, Bales.	1914, Bales.
In mills in the Cotton States	979,517	905,517
In mills in all other States	863,547	765,861
Totals for United States	1,843,064	1,671,378

Linters, not included above, were 25,739 bales consumed in November, 1914 (vs. 26,242 in November, 1913). Stocks of linters on November 30, 1914, were 78,353 bales in manufacturers' establishments (vs. 58,823 on November 30, 1913) and 56,809 bales in independent warehouses (vs. 34,541 bales on November 30, 1913). The domestic consumption of linters for the four months ended

WILLIAM RAY & CO.

Atlantic Mutual Insurance Company

ATLANTIC BUILDING

51 Wall Street, New York

INSURES AGAINST MARINE AND INLAND TRANSPORTATION RISK AND WILL ISSUE POLICIES MAKING LOSS PAYABLE IN EUROPE AND ORIENTAL COUNTRIES.

Chartered by the State of New York in 1842, was preceded by a Stock Company of a similar name. The latter Company was liquidated and part of its Capital, to the extent of $100,000, was used, with consent of the stockholders, by the Atlantic Mutual Insurance Company and repaid with a bonus and interest at the expiration of two years.

During its existence the Company has insured property to the value of	$27,219,045,826.00	
Received Premiums thereon to the extent of		$282,298,429.80
Paid Losses during that period	$141,567,550.30	
Issued Certificates of Profits to dealers	$89,740,400.00	
Of which there have been redeemed	$82,497,340.00	
Leaving outstanding at present time	$7,243,060.00	
Interest paid on Certificates amounts to	$22,585,640.25	
On December 31, 1913, the Assets of the Company amounted to		$13,259,024.16

The profits of the Company revert to the assured and are divided annually upon the premiums terminated during the year, thereby reducing the cost of insurance.

For such dividends, certificates are issued subject to dividends of interest until ordered to be redeemed. In accordance with the charter.

A. A. RAVEN, President
CORNELIUS ELDERT, Vice-President
WALTER WOOD PARSONS, 2d Vice-President
CHARLES E. FAY, 3d Vice-President

The Interstate Commerce Commission and its Revised Decision in the Freight Rates Increase Case

MORE than one point of view may be adopted in interpreting the significance of the decision handed down, at the end of last week, by the Interstate Commerce Commission upon the revived and re-heard application of the railroads in so-called Official Classification territory for a five per cent increase in the general body of their freight rates. Both in the public press and in the expressions of railroad men proper, as well as of bankers, large investors and others directly concerned with our railroads, no inconsiderable divergence of opinion with respect to the deductions that may be drawn from the opinion, has been apparent. Some have contented themselves with acclaiming the at last accomplished fact that the most important group of railroads in the country is to be allowed to have a material and imperatively needed addition to the revenues earned by its members. Others, and these a far larger number, have seen in the decision not only an immediate boon to the railroads affected, but also a warrantable indication or assurance that the Interstate Commerce Commission has finally been brought to see that its attitude towards the railroads has not been commending itself to the intelligent public, that its traditional policy of "all for the public and nothing for the railroads" is no longer acceptable, and that it is expected to show itself just as jealous for the strength and prosperity of the railroads as it is for the rights of users of the railroads, in respect of just and reasonable rates. Finally, a few persons have scrutinized the Commission's decision, not so much from the point of view of the immediate beneficial results it will give or from that of its inferred promise of somewhat fairer and more generous treatment of the roads by the supervising authority, as for the purpose of getting further light upon the far larger question of the competence of the Commission itself in the field wherein it has been given sway and of the general advantage or disadvantage which the community as a whole is deriving and is likely to derive from its activities. To this last class of interpreters of the decision, what is really important is less that the railroads should be tided over a financially pressing and embarrassing period or even that some allowance should be made them for costs increasing in this or that direction, than that there should be evidence on the part of the Commission itself of a sure and firm hand in dealing with large and little understood matters, of ripened knowledge of all the fundamentals of economic activity and effort in modern society and of resolute expertness in meeting the ever changing economic conditions under which railroads, like all other economic enterprises, must work, with the swiftness, flexibility and precision which are the secret of economic efficiency in the larger sense. The Interstate Commerce Commission, as it has come to be through the gradual enlargement of its powers, is the most striking embodiment we have of the doctrine, which has been creeping upon us in the past quarter century, that we cannot safely trust the working out of our vital economic and social problems to the free play and counterplay of individual activities and energies, under the restriction only of general

laws, but that we require the continual interposition of the discretionary authority of selected or elected governmental officials, charged with the duty of "protecting" social interests not in a position to protect themselves in a given department of business, and likely to be neglected and harmed on that account. For all those who urge the introduction of this kind of authority in other fields of business than that of the railroads, the Interstate Commerce Commission is the great exemplar of the beneficent and effective supervision and regulation of the naturally selfish and wayward and deleterious methods and practices of the persons engaged in such businesses. Hence students of the legitimacy of the claims asserted on behalf of the entire doctrine, which for the sake of convenience may be dubbed the regulatory commission doctrine, are deeply interested in all action of the Interstate Commerce Commission which has or appears to have fundamental economic and social importance. They judge this commission, the primate among commissions in the United States, by what it does; and they infer from what it does the kind of action that may be expected from other commissions in other fields of business.

There is instruction to be derived from examining, even with the necessary brevity of a single article, the recent decision of the Interstate Commerce Commission from the standpoint of each of the classes of persons just mentioned. In other words, it is pertinent to inquire what the Commission has actually done, first, in respect of mere relief of the immediate necessities of the railroads affected; second, in respect of a real or surmised alteration of the Commission's traditional policy with regard to the governmental supervision of the railroads on behalf of the public at large; and, third, in respect of a demonstration of the permanent advantage to the interests of the country as a whole (including the interests of the railroads themselves), to be gained from entrusting to such a body as the Commission the ultimate authority over the most vital matters in connection with the entire operation of railroads, i. e. the price they may obtain for their services and the resultant encouragement or discouragement of their activity, their initiative, and their development, intensive and extensive.

Taking up first the question of the amount of the actual financial relief which the railroads in Official Classification territory may expect to obtain from the permitted increase of their freight rates, we must of course recognize at the start that a considerable element of conjecture intrudes itself. The volume of freight traffic fluctuates extensively, and with it necessarily fluctuate the gross revenue earned and the aggregate amount yielded by any percentage increase of the rates on any or all commodities hauled. At the present time, as is well known, the railroads are suffering from the general depression in business; and nobody can predict how soon this depression will pass and freight traffic respond to the renewed activity. On the basis of the traffic in 1913-1914, of the thirty-five railroad systems covered by the Commission's decision, however, it seems probable that not far from $30,000,000 a year will be realized from the allowed five per cent increases of rates. One of the Commissioners puts the figure at $35,000,000; but it is in the nature of Commissioners to be optimistic about matters of this kind. It has also been estimated that $50,000,000 a year may be realized by the railroads from the rate increase taken together with the possible savings obtainable through the ten expedients suggested by the Commission in its earlier decision refusing the general increase of rates, provided only the railroads will resolutely adopt these expedients in the face of the protests of shippers and, to a considerable extent, of the behests State railroad commissions or even of State laws. Obviously, the only safe course here is to fall back upon the $30,000,000 which seems to be generally agreed upon as a reasonable estimate. And this $30,000,000 is somewhat less than one-half of one per cent upon the total property investment of the thirty-five railroad systems in question, this having stood on June 30, 1914, the end of the governmental fiscal year, at $6,500,000,000, in round figures. The increase, taken as additional interest upon the capital investment, represents, therefore, approximately a fourth of the advance of the world interest rate for permanent investments which has occurred during the past five years and principally during the past year; for this advance of the world interest rate, for other than temporary accommodation, has been quite two per cent.

It may be asserted, however, that the greater part of the property investment of the railroads still calls for only the older and lower rates of interest, and that the burden of the new and higher rates will only gradually come on, as earlier issues of securities are refunded, as new capital in the shape of bonds or notes, is raised at the higher rates, and as stock must promise the larger dividends which investors will demand and insist upon obtaining, if they are to advance their capital to the railroads or to any other kinds of enterprise. There is some force in this contention, though far less than appears on the surface. Yet it is well enough to approach the matter from another angle, that of the effect of the freight rate increase upon the margin left to the railroads after the compensation of the capital already invested in them at the old and now admittedly insufficient rates. In the year ended June 30, 1914, according to the statistics of the Interstate Commerce Commission itself, the aggregate net return upon the property investment of the thirty-five railroad systems was only 3.99 per cent of the amount of that investment; the roads paying dividends paid total dividends of $118,000,000 in round figures (a decrease of $12,000,000 from the previous year); and the aggregate surplus of all the roads together was drawn upon for about $8,200,000 on this account alone, while the net result of all the profit and loss accounts of the roads was a decrease in aggregate surplus of no less than $34,578,288. Thus it appears that, in default of a material improvement in the volume of freight traffic, the thirty-five railroad systems will be able, through the $30,000,000 increase of their revenue, to pay the same dividends they did last year and add $22,000,000 to their surplus, from operation; or to pay the same dividends they paid in 1912-1913 and add $10,000,000 to their surplus, from operation; but that if they have to provide for the same unfavorable outcome of their general profit and loss accounts as occurred last year, they must continue to cut into their surplus, which ever dividend scale they follow. And in this calculation no allowance is made either for the remuneration of new capital required or for increases of interest rates upon such securities as may have to be refunded. Such is the measure of the immediate relief or benefit granted to the applying roads by the recent decision. It is encouraging upon the principle that "half a loaf is better than no bread."

When, now, we turn to the ground for encouragement found by some in the Commission's decision, by reason of the fact that it indubitably does what no previous decision

of the Commission in all its history has done,—i. e. concedes that conditions may come about, and now have come about, that entitle the railroads to a higher, rather than justify the compulsion of a lower, rate of compensation for their services,—it can hardly be said that a reading of the decision itself brings conviction of the substantiality of this ground. The granted increase is, of course, substantial enough, so far as it goes; but there are also indications that it was somewhat reluctantly and ungraciously allowed even by the majority of the Commission, while it is a certainty that the Chairman, Mr. Harlan, and another Commissioner, Mr. Clements, were desperately opposed to it, for they have said so in almost acrimonious dissenting opinions. It would be unprofitable to make the attempt to ascertain, inductively or deductively, the real motives that led the majority of the Commission to depart now from the chief part of its decision rendered on July 29 last, but we do not think it can be said that there is evidence of any fundamental change of conviction on the Commission's part. Indeed, the main justification for any hope of a modified policy henceforth towards the railroads is to be found, not in the main text of the present decision, but in a quotation therein from an earlier decision,—that known as "Advances in Rates, Western, Case," (20 I. C. C. 307, p. 317). This quotation may be given here, for such significance as it may have. It reads:

"We must not regard too seriously, however, the effort of railroad counsel to establish this Commission *in loco parentis* toward the railroads. We must be conscious in our consideration of these rate questions of their effect upon the policy of the railroads and, ultimately, upon the welfare of the State. This country cannot afford to have poor railroads, insufficiently built, carelessly operated. We need the best of service. Our railroad management should be the most progressive. It should have wide latitude for experiment. It should have such encouragement as would attract the imagination of both the engineer and the investor. Nevertheless, it is likewise to be remembered that the Government has not undertaken to become the directing mind in railroad management. We are not the managers of the railroads. And no matter what the revenue they may receive there can be no control placed by us upon its expenditure, no improvements directed, no economies enforced."

We must admit that we are ourselves unable to deduce any sure intention, hopeful or the contrary, from this quotation. We do not even know exactly what it means to say. The Commission will not have it that it stands *in loco parentis* to the railroads; yet it has the power to determine, virtually without appeal, what allowance shall be granted to the railroads,—one of the most common attributes of parentage. And all the ideal qualities which the Commission would have our railroads possess depend in the last resort upon this allowance. If it be niggardly, the railroads will be none of the things which the Commission says they ought to be; if it be adequately, yet judiciously, accommodated to what is expected of the railroads, considering the part they are called upon to play in the life of the country, they can be counted upon to respond eagerly and largely. But nowhere does the Commission assert decisively that considerations of this kind will hereafter have their due weight in all its determinations of the compensation which the railroads shall be permitted to receive for the services they render.

This brings us to the third and most important aspect of the Commission's recent decision, the light it throws upon the question of the real competence of that body in the greatest of all the departments of the country's business and of the genuine advantage to the country of having it actually, if not admittedly, the ultimate arbiter of the destinies of the railroads, in respect both of the compensation their owners and managers shall receive and of the character and extent of the services they shall render. Compensation and services are correlative terms in the final analysis; what affects one affects the other. And the determination of compensation, if this is removed from the field of natural competition, is a matter of the most difficult and complicated kind. Rules of thumb are not only valueless, but destructive and ruinous, if they are allowed any place in it. Thus it may be said of all the criteria which the Interstate Commerce Commission has hitherto used in deciding whether railroad rates are "just and reasonable," that they are mere rules of thumb, and consequently incompatible with any sound conclusion in the larger sense. The traditional reasoning of the Commission upon the propriety of railroad rates is embodied in a single sentence of Commissioner Clements' dissenting opinion in this very case: "Carriers have a right to earn all they can on the business which they can secure at just and reasonable rates." And this is pure economic nonsense, absolute putting the cart before the horse. For the economic truth is that those rates are just and reasonable, whatever they may be, which are required to procure the capital and brains necessary to give the public the railroad service it needs and desires. There is no other criterion of the justice and reasonableness of railroad rates but this, precisely as there is no other criterion of the justice and reasonableness of the price of cotton other than that such or such a price must be paid to induce the production of as much cotton as the world needs to consume. Hence all the projects, for which the Commission has long shown such liking, intended to ascertain the property value of the railroads and to adjust their tariffs so that the yield upon this value may correspond to some rate of interest or return assumed to be fair and reasonable are pure economic moonshine, just as worthless as the statistical investigations of the average cost of producing cotton or wheat. The only result of them, if the action of the Commission is predicated upon what they appear to show, must be to sever the vital connection between the railroads and the economic whole to which they belong. Then the only relief will be irrational and incalculable accommodations of theory to hard fact, similar indeed to the apparent accommodation embodied in the Commission's present decision. We are forced to make this last remark, because we fail to find in the decision any sure evidence that the Commission has at last arrived at the root of the matter, or that in any fundamental way it has departed from its old false gods. It may seem strange to say it, yet it appears to us that in the present case the logic,—a bad logic with bad premises, to be sure,—is still the true traditional logic of the Commission as a whole; and that the action of the majority is quite as inharmonious with that logic as Chairman Harlan and Commissioner Clements assert it to be. Accordingly, the decision is for us slight evidence that the Commission is entering upon a new and wiser course in dealing with the railroads.

Arthur Richmond Marsh

POLITICAL AND ECONOMIC PROBLEMS BROUGHT HOME TO THE UNITED STATES BY THE EUROPEAN WAR

By John Hays Hammond*

IN discussing the Sherman law, at our meeting a year ago, I said that "it is unfortunate that the solution of great problems, purely economic in character, is not always dissociated from politics; that legislation dealing with the tariff, the currency, the trusts and other economic subjects vital to the welfare of the entire Nation is in a large measure determined on strictly political lines,—indeed, is settled by politicians upon the stump rather than by business men in boards of trade."

To-day I would reiterate that opinion with added emphasis, in view of the momentous problems affecting the welfare of our nation injected into our political, economic and social life by the great European War.

From the war we learn more clearly than before the interdependence of the nations of the world, politically and economically; that neither political neutrality nor geographic isolation makes any nation exempt from the consequences of a great international crisis. This is no time to attempt to apportion the responsibility of the belligerent nations for the war; but we must recognize the fact that preparedness for war—"the armed peace" that has been so much deprecated and yet unavailingly—during past years, not only does not preclude war but greatly augments its ravages when armed peace terminates. We learn the dreadful lesson that international treaties are but "scraps of paper," having no validity when opposed to the principle that "might makes right." We learn also that military impotency, on the other hand, is no guarantee for a nation's security, but that the best safeguard of a nation's integrity indubitably is its own ability to defend itself against foreign aggression; and that this will be so until such time as there shall be universal disarmament and the establishment of an International Court of Arbitral Justice, authorized and empowered to maintain a righteous peace among nations.

But it is the economic rather than the political aspects that I shall discuss. There can be no doubt that the most important economic lesson is the complete vindication of the policy of building up and expanding our home industries. We see more clearly than ever the interdependence of all our industries—the vital dependence, for example, of that great industry of agriculture on the prosperity of the manufacturing industry, for in the manufacturing centres it finds its best markets. We see the importance of all industries to the extensive classes employed in our great transportation systems, in our agencies of distribution, etc.; and so, too, we see more clearly than ever the indissoluble ties that bind together all the other national industries; and we must conclude, therefore, that the keynote of our economic and fiscal legislation must ever be to preserve unimpaired the "purchasing power" of our domestic markets.

We learn the importance of the diversification of our industrial products and of expanding our foreign trade. It is because of the magnitude and diversity of our home market that we have made heretofore, relatively speaking, but desultory and inadequate efforts to extend our foreign markets. Despite this fact, our export trade is to-day one-eighth of the world's total, evidencing the potentiality of our Nation as a competitor for foreign markets. The magnitude of our domestic trade ($34,000,000,000) may be best realized by stating that it is seventeen times as great as our total export trade; twice as much as the total exports of the world, and about equal to the foreign commerce of the world. The value of articles manufactured in Greater New York alone is about equal to the value of the Nation's total exports, i. e., $2,000,000,000.

While the rapid expansion of our industries is a natural and laudable ambition, we must nevertheless not lose sight of the fact that over-extension inevitably causes depression in times of business recession. Authorities agree that we are now rapidly approaching the limit,—that is to say, the point of saturation,—in our domestic markets, at least in so far as pressing demands under normal conditions are concerned. It is obvious, therefore, that we must either curtail the capacity of our factories, which would result in throwing out of employment millions of wage-earners, and the disorganization of complementary industries as well, or we must depend upon the exploitation of foreign markets for the relief of our congested home industries.

In competing for foreign markets, we are to meet our great trade rivals, who have by years of experience and by the expenditure of colossal sums obtained a foothold more or less firm in the markets we seek. Therefore, to successfully compete with these nations we must secure for ourselves every advantage that can be derived from the most efficient exploitation of our home industries, fostered by constructive legislation and promoted by able commercial diplomacy abroad. To obtain this vantage ground, the co-operation of our lawmakers is indispensable. In this regard our country has been seriously handicapped compared with the beneficent influence extended by foreign governments—notably by Germany—to their captains of industry. Here, legislation affecting our industrial developments has been too often determined by considerations of party expediency; and economics has in consequence been subordinated to politics.

The result of the vehement attacks by our Federal Government upon corporations, indiscriminately impeaching the integrity of our corporate practices and of our business men, has prejudiced our position in foreign money markets, and has consequently enhanced the difficulty of obtaining capital for our industrial needs. Our Nation has borrowed from abroad upwards of $6,000,000,000 for the development of our great industries. The term "borrowed" is misleading; and a very large part of this sum does not carry with it any obligations in the nature of a loan, but is rather the market value of American securities, and in a large measure real estate, purchased by foreign investors, which in that sense only is a lien against the capitalized wealth of the Nation. Because of the present war we cannot reasonably expect further considerable assistance in the near future. Not only is this the case, but there is, moreover, the danger of foreign exchanges dumping American securities on the market; and this is a great menace to the Nation's otherwise strong financial position.

There is to-day a revulsion of feeling throughout the country as to what should be the attitude of our legislators in respect of our national industries; and I believe the compelling force of enlightened public opinion will in the future result in legislation facilitating, rather than obstructing, the processes of industrial development, while at the same time adequately safeguarding the interests of State, community and individual.

One of the most hopeful signs of our industrial progress is the fact that no longer is the belief general that there exists fundamentally an irrepressible conflict between capital and labor. The maintenance of industrial peace is now recognized as indispensable to industrial progress, and the mutual interests of capital and labor, with the reciprocal obligations, is now accepted as an axiom in our industrial development.

There has been, coincident with the declaration of war in Eu-

*An address delivered at the Annual Meeting of the National Civic Federation, in New York, December 5, 1914.

rope, considerable enthusiasm,—verging, indeed, on hysteria,—in the agitation to build up our export trade in Latin-America. The opening of the Panama Canal has also given a stimulus to this movement; but, lest we repent at leisure, it behooves us to exercise caution and discrimination, that is, to "make haste slowly," in our efforts to obtain Latin-American trade. While the Panama Canal will undoubtedly be of great advantage to this country in the development of commerce, it will not facilitate our trade with Mexico, Central America, nor with the Northern and Eastern sections of South America, with the exception of that commerce to be developed between our Pacific Coast States and those points. In the future the bulk of our Latin-American trade will be with the South American States on the Atlantic, and not with those on the Pacific Ocean.

The immensity of the area of the Latin-American States, aggregating 9,000,000 square miles (or nearly three times that of Continental United States), with a population proportionately almost as great, appeals to the imagination of our manufacturers, merchants and exporters; but there are important problems—financial, engineering, social and economic—to be solved before the potentialities can be realized. The total imports into South America to-day from all nations are valued at $350,000,000 annually—less than the sum of our exports to the United Kingdom and Canada; less than one-half the value of the manufactured products of Greater New York, and less than one-fortieth of our own domestic trade. These figures further emphasize the magnitude of our home market.

With characteristic national strenuosity and impetuosity we began to agitate the instantaneous creation of a merchant marine, as the first step to attain this end. We did not realize that the lack of a national merchant marine was by no means the greatest obstacle to the immediate development of our trade with South America. We ignored the "absorptive power," as well as the far more important factor, the "purchasing power," of those countries. Hardly more than a cursory investigation of this subject suffices to show us that this is by no means the psycological moment for the development of the South American field,—that is to say, if we are to expect substantial returns within the near future. The financial conditions in South America at present are unfortunately decidedly adverse. This state of affairs exists likewise in China, in Central America and many other countries, not entirely due to, but greatly augmented by, the European War. As a matter of fact, many of these countries have borrowed from Europe sums far in excess of their ability to repay for some time to come. Much of this money undoubtedly has been wasted, but the greater part has been expended in industrial and commercial undertakings which have not as yet reached the period of fruition. Even before the war many of these countries were in financial distress. The war has, as I have said, greatly aggravated this condition, because of the depreciation in the value of their products, owing to lack of European markets. If we, now, are zealous to promote the extension of our Latin-American trade, we must be prepared to assist in financing the governmental necessities and also the requirements for the completion and expansion of the industries and commerce of these countries. It will be a long time undoubtedly before European capital will be available for that purpose.

Under the conditions existing before the war, our country has been able to secure comparatively cheap money from abroad for its industrial needs; and it would have been able, had those conditions lasted, to finance in a measure the development of the natural resources of Latin-America with the profits derived from the exploitation of home industries financed by European capital. These conditions, however, will not obtain again for some years, after peace is established in Europe. Under the circumstances it seems to me that the cardinal principle for the investment of American capital must be to at first amply provide for the expenditures required for the industries of our own nation. Undoubtedly the time will come when American capital will seek investment in the development of the industries of the newer countries; and from that investment will result a proportionate increase in our foreign trade. If, however, American capitalists are to assume the rôle of banker and broker for Latin-America, we must reverse our governmental policy in many respects. We must, for example, encourage and assist our manufacturers, merchants, bankers and transportation agencies in "drumming up" and building up foreign trade. To do this, we must have the cordial assistance and cooperation of the Department of State and of our Consular Service. The Government must cease to stigmatize Americans who invest their money abroad in foreign industries as unprincipled exploiters. We must, rather, emulate the example of the German government in its sympathetic and stimulating co-operation with the citizens of that country in their activities in foreign lands. Above all, we must guarantee to our citizens the same degree of protection as to life and property accorded the citizens of other nations by their governments. To obtain cheap money, which is required for proper industrial development, Latin-American nations must guarantee the security of investments of foreign capital against discriminatory laws and confiscation, especially in times of revolutionary movements.

To attain the confidence of American investors and thus to obviate the serious objections to investments in some Latin-American countries, I believe a Pan-American Supreme Court should be created, to deal specifically with and to decide disputes as to foreign investment in Latin-American States. Such a court should be composed of the leading jurists of our own and of the Latin-American nations; and it should sit in neutral territory. If inspired only by self-interests the aim of such a court would obviously be to establish confidence in the security of Latin-American investments; and for that reason foreign investors would be assured of fair treatment. Such a court might well be one of final resort. In any event, it should try cases and endeavor to adjudicate claims before appeal through diplomatic channels, which almost invariably results in friction and often, indeed, in extreme tension.

Cordial good feeling between nations is essential to advantageous commercial relations; and it is for this reason that many of us advocate the substitution of a Pan-American Defensive Alliance for the Monroe Doctrine, in South America. There no longer exists the necessity of maintaining this doctrine, as applied to the whole of South America; and the people of that continent resent what they regard as supererogation on our part. We should, I believe, restrict the application of the Monroe Doctrine to the States of Central America, to Mexico and to the countries in the Carribean Sea area.

I do not share the apprehensions of those who believe that a very long time will be required for the rehabilitation of the industries of the warring nations; for it seems incredible that the war will terminate only with the utter destruction of the industries and the material resources of those countries. It seems far more probable that the time will come—and that at no distant day—when one or the other side shall have received a defeat sufficiently decisive to place it in a position where the further continuation of hostilities would be suicidal, and, therefore, make it ready to accept the mediation of neutral nations, and to conclude terms of peace which do not involve anything suggestive of subjugation.

Owing to the ravages of war and the colossal national indebted-

ness incurred for war purposes, a long time (years, but not generations, as has been often suggested) will be required before the belligerent nations shall become again leading factors in the world's commerce. Their first aim will be, of course, to build up their home industries, to give employment to their own citizens; and the fiscal policies of some of the nations may be so modified, with respect to their tariffs, as seriously to affect our trade relations with them. It may be purely speculation, but it seems quite within the bounds of probability—certainly it is possible—that Great Britain will change her tariff to protect her own market, which has been for many years the dumping place for the products of other nations, and that she will establish, upon the basis of some kind of protective system more effective trade arrangements in the way of reciprocities with her colonies and dependencies. The importance of such a change of policy, as affecting the United States, is obvious, having regard to our export trade alone. Our exports to the United Kingdom in 1913 were $597,000,000; to Canada, $285,000,000,—together constituting over 40 per cent of our total exports.

Russia offers, in my opinion, one of the best fields for the expansion of our trade. But few countries can compare with her in undeveloped natural resources. She lacks what our country can supply in the way of engineering skill and experience in the development of new territories; because Russia has not as yet created a great middle class, which performs the executive function in a nation's industrial growth.

COMPLETE TEXT OF THE OPINION OF THE ATTORNEY GENERAL OF THE UNITED STATES DECLARING THE FEDERAL RESERVE BOARD INDEPENDENT OF THE TREASURY DEPARTMENT

OF first importance to the success of the Federal Reserve system is the opinion rendered on December 19, 1914, by Attorney General Gregory with regard to the independence of the Reserve Board from Treasury authority. There has been a growing feeling among many students of the new Federal banking system that the independent position which the Reserve Board was intended to occupy had not, in practice, been accorded it by the present Administration. While the Federal Reserve Act was in process of passage, President Wilson was quoted as saying that he considered the Board, in effect, the Supreme Court of Banking. It was naturally hoped that this point of view connoted an entire independence, on the part of the Board, of all political influence. Such a hope has not, in the opinion of many, been justified by the later attitude of the Government.

In the first place, the Act as passed provides, in a manner which indicates something in the nature of an afterthought, or a superimposition, that "the Secretary of the Treasury shall be ex-officio chairman of the Federal Reserve Board." This phrase occurs in the fourth paragraph of Section 10 of the Act, following the provision that "the first meeting of the Federal Reserve Board shall be held in Washington, District of Columbia, as soon as may be after the passage of this Act, at a date to be fixed by the Reserve Bank Organization Committee."

The first paragraph of Section 10 provides for the appointment and compensation of the Board. The second paragraph prescribes the qualifications and designations of the members. Among other things it sets forth that "of the five persons thus appointed, one shall be designated by the President as governor and one as vice-governor of the Federal Reserve Board. The governor of the Federal Reserve Board, subject to its supervision, shall be its active executive officer." No reference is made in this paragraph to the position of the Secretary of the Treasury as chairman of the Board. It is pointed out by the Attorney General in his recent opinion that the earlier draft of the Act (H. R. 7837, Section 11) made the "manager" of the Board "subject to the supervision of the Secretary of the Treasury and the Federal Reserve Board." In the Act as passed, he is made subject to the Board alone.

It would seem clear, then, that one paragraph of Section 10 of the Act, as passed, specifically established the authority of the governor of the Board, independent of Treasury supervision. It is hard to believe that the drafters of the section referred to did not originally intend that the "chief executive officer" of the Board should also be the presiding officer at its meetings. It appears, however, that the provision which makes the Secretary of the Treasury ex-officio chairman, in effect renders nugatory the provision in the earlier paragraph of the same section with regard to the powers of the governor of the Board.

It has been suggested that this later provision was inserted, in view of the newness of the organization, to insure the orderly transaction of the early business of the Board through the leadership of an official experienced in the fiscal affairs of the Government. This suggestion gains support from the context of the provision in question. The phrase quoted above, which immediately precedes it, refers to the time and place of the first meeting of the Board. The phrase which follows also refers to early organization. It provides that "no member of the Federal Reserve Board shall be an officer or director of any bank, banking institution, trust company, or Federal reserve bank, nor hold stock in any bank, banking institution or trust company; and before entering upon his duties as a member of the Federal Reserve Board he shall certify under oath to the Secertary of the Treasury that he has complied with this requirement."

The position of authority which this provision gave to the Secretary of the Treasury in the early days of the Board's existence perhaps only accentuated the prestige which that official acquired as a member of the Reserve Bank Organization Committee. As emphasizing this tendency may be cited the further provision of Section 10 of the Act, that "The Secretary of the Treasury may assign offices in the Department of the Treasury for the use of the Federal Reserve Board." At all events, there had arisen sufficient doubt as to whether or not the Federal Reserve Board was a bureau of the Treasury, actually to warrant a state of uncertainty on the part of one of the auditors of the Treasury as to the disposition of the funds raised by the Board by semi-annual assessment to be levied on the Federal Reserve Banks. The Secretary of the Treasury accordingly submitted that particular question to the Attorney General, together with a request for an opinion "as to the status of the Federal Reserve Board, particularly with reference to the Treasury Department."

The opinion of the Attorney General is clear. He holds that the Secretary of the Treasury and the members of the Federal Reserve Board are co-ordinate officials. He points out that while the Act specifically intended to preserve to the Secretary supremacy in all cases where their respective powers conflicted or overlapped, yet it "clearly recognized the existence of powers of the Board independent of the Secretary in cases where no such conflict existed." This can hardly fail to be regarded as a step in the right direction. However, it is only a step. Wholly independent of any personal or political considerations, it will be generally conceded that the establishment of a "Supreme Court of Banking" is wholly incompatible with domination, as chairman, over such organization, by an official appointed by and subject to a political party. The Board cannot be wholly on a judicial basis, a basis of

freedom from Treasury influence, until the Act is so amended as to make the governor of the Board its actual as well as its titular head; and until the discretionary power with regard to the deposit of Government funds with the Federal Reserve Banks is taken from the Secretary of the Treasury.

The opinion of the Attorney General is given in full below.

* * *

OFFICE OF THE ATTORNEY GENERAL.
Washington, D. C.

December 19, 1914.

The Honorable, The Secretary of the Treasury,
Washington, D. C.

Sir:—I have the honor to acknowledge your letter of October 29, 1914, wherein you request my opinion (a) whether accounts of moneys derived from the semi-annual assessment to be levied on Federal Reserve Banks by the Federal Reserve Board, are subject to audit by one of the auditors of the Treasury Department, and (b) as to the status of the Federal Reserve Board, particularly with reference to the Treasury Department.

Section 10 of the "Federal Reserve Act" of December 23, 1913, (the act authorizing the assessment), provides:

The Federal Reserve Board shall have power to levy semi-annually, upon the Federal Reserve Banks, in proportion to their capital stock and surplus, an assessment sufficient to pay its estimated expenses and salaries of its members and employes for the half-year succeeding the levy of such assessment, together with any deficit carried forward from the preceding half-year.

The answer to your first question depends on whether the moneys so levied by the Federal Reserve Board are, when received, "public moneys." If so, they are clearly to be audited under Sections 7 and 10 of the Act of July 31, 1894, (28 Stat. 207) either by the auditor provided for in the first paragraph of said Section 7 or by the auditor provided in the fifth paragraph, such paragraphs (so far as material) reading as follows:

First. The Auditor for the Treasury Department shall receive and examine all accounts of salaries and incidental expenses of the office of the Secretary of the Treasury and all bureaus and offices under his direction, all accounts relating to * * * and all other business within the jurisdiction of the Department of the Treasury and certify the balances arising thereon to the Division of Bookkeeping and Warrants.

Fifth. The Auditor for the State and other departments shall receive and examine all accounts of * * * and accounts of all boards, commissions and establishments of the Government not within the jurisdiction of any of the Executive Departments. He shall certify the balances arising thereon to the Division of Bookkeeping and Warrants.

Section 10 (so far as material), provides for a division of Bookkeeping and Warrants and that:

Upon the books of this division shall be kept all accounts of receipts and expenditures of public money, etc.

Reference is also made to the Act of February 19, 1897 (29 Stat. 550), reading (so far as material) as follows:

All books, papers and other matters relating to the office or accounts of * * * commissions, boards and establishments of the Government in the District of Columbia, shall at all times be subject to inspection and examination by the Comptroller of the Treasury and the Auditor of the Treasury authorized to settle such accounts, or by the duly authorized agents of either of said officials.

This statute plainly applying to boards, etc., *located* within the District of Columbia, rather than to boards of the District Government; and the Federal Reserve Board being located within the District:

I am of the opinion that moneys received by the Federal Reserve Board, under Section 10 of the Act of December 23, 1913, are "public moneys" within the meaning of these auditing statutes, for the following reasons, among others:

(1) The assessments are levied by a board whose members in respect to appointment, tenure, duties, and compensation meet all the requirements of the definition "public officers" and "officers of the United States."

(2) The assessments are levied by such officers pursuant to the provision of a Federal statute and are devoted to the payment of official salaries and the expenses of this official board.

(3) These moneys after collection, are no longer the property of the paying banks, and must be viewed as moneys belonging to the United States, and therefore public moneys as defined by the Supreme Court of the United States in Branch v. United States, 100 U. S. 673.

In the United States v. Bromley, 12 How. 88, it was held, that postal collections from stamp sales are public revenues:

The revenue of the Post Office Department being raised by a tax on mailable matter conveyed in the mail and which is disbursed in the public service, is as much a part of the income of the Government as moneys collected for duties on imports.

The analogy is marked for the reason that in like manner as the money assessed by the Federal Reserve Board is for the purpose of meeting the salaries and expenses of the Board, so the use of the postal collections is confined to sustaining the specific service by and in which they are collected.

(4) Other provisions of the Federal Reserve Act (Sections 11-c and 16), dealing with interest charges, taxes and penalties, can only be satisfied by deposit in the Treasury of the levies, taxes and penalties so imposed and there seems to be no logical ground for distinction between such assessments and the ones in question. The idea of necessary public control is also strengthened by the requirements of Rev. Stat. Sec. 3639.

The moneys received by the Federal Reserve Board under Section 10 of the Act of December 23, 1913, being thus, in my opinion, public moneys and consequently subject to audit by one of the auditors of the Treasury Department, the question is then directly presented under which paragraph of the Act of July 31, 1894, *supra*, the audit is to be made. This involves the further question on which you have asked my opinion: namely, whether the Federal Reserve Board is an independent board, commission or Government establishment or whether it is a bureau, office or division or otherwise a part of the Treasury Department.

That the Federal Reserve Board is a "board" or "establishment" of the Government within the meaning and intent of those words as used in the Fifth Paragraph of Section 7 of the Act of July 31, 1894, is plain from the provisions of the Federal Reserve Act and the explanation of the status of the Board contained in the reports accompanying the original bills in Congress. This conclusion is sustained by reason and analogy, when reference is had to the considerable number of boards or establishments of far less general or National scope which have been so esteemed and uniformly treated. (See Report of Joint Commission to Inquire into Executive Departments, October 9, 1893, House Reports, 1st Session 53rd Congress, Report No. 88.)

Consideration of the history of the Federal Reserve Bank Act, of the general scheme of the whole act, of the functions to be per-

formed by the Federal Reserve Board and of the method of their performance, leads me to the clear opinion that the Board is an independent board or government establishment.

The Federal Reserve Board is not merely a supervisory, but is a distinctly administrative board with extensive powers. It is described as follows in the report of the Committee on Banking and Currency to the House of Representatives (63rd Congress, 1st Session, Report No. 69):

Page 16. In order that these banks may be effectively inspected and in order that they may pursue a banking policy which shall be uniform and harmonious for the country as a whole, the committee proposes a general board of management *intrusted with the power to overlook and direct* the general functions of the banks referred to. To this it assigns the title of "The Federal Reserve Board."

* * * * * * * * * * * * *

Page 18. The only factor of centralization which has been provided in the committee's plan is found in the Federal Reserve Board, which is to be a strictly Government organization created for the purpose of inspecting existing banking institutions and of regulating relationships between Federal Reserve Banks and between them and the Government itself. * * *

Page 42. Section 11. In this section provision has been made for the creation of a general board of control acting on behalf of the National Government.

* * * * * * * * * * * * *

The report of Senator Owen from the Senate Committee on Banking and Currency (63rd Congress, 1st Session, Report 133, part 2) says merely:

The Federal Reserve Board consisting of the Secretary of the Treasury and six members appointed by the President of the United States and confirmed by the Senate for terms of six years, are given the following powers: (Here follows an enumeration of powers.)

The broad functions outlined in these Reports are assigned to the Board in twelve subdivisions of Section 11 of the Act giving to it certain powers and authority, and in various other sections containing specific grants of authority to exercise about forty other powers. Moreover, in subdivision (1) of Section 11 the all-embracing requirement appears that said board shall perform the duties, functions or service specified in this Act, and make all rules and regulations necessary to enable said board effectively to perform the same.

The Act, further contains no express provision that the Federal Reserve Board shall be considered as a bureau, division or office of the Treasury Department—a significant omission in view of the fact that Congress had under consideration a bureau of that Department when it amended the Revised Statutes relative to that bureau of which the Comptroller of the Currency was the chief officer and the provision in Section 10 that "the Secretary of the Treasury shall assign offices in the Department of the Treasury for the use of the Federal Reserve Board" (a provision added to the bill by the Senate Committee) would be highly superfluous if the Board were a bureau of that Department for which the Secretary already possessed complete authority to assign offices in his own departmental buildings.

The history of the bill develops the following facts of significance:

In Section 11 of H. R. 7837 (Section 10 of the Act), it is provided:

The manager of the Federal Reserve Board, subject to the supervision of the Secretary of the Treasury and Federal Reserve Board, shall be the executive officer of the Federal Reserve Board.

This clearly contemplated that the Secretary of the Treasury and the Federal Reserve Board were distinct entities.

In the Act as passed (Section 10), the supervision of the Secretary of the Treasury is stricken out, leaving the governor (manager) subject to the supervision of the Board.

In Section 16 of H. R. 7837 (Section 16 of the Act) it is provided:

The Secretary of the Treasury shall, *subject to the approval of the Federal Reserve Board*, from time to time apportion the funds of the Government among the said Federal Reserve Banks, distributing them as far as practicable equitably between different sections. * * *

This also clearly contemplated the Secretary and the Board as co-ordinate officials. The whole provision was stricken from the Act as passed but nothing was substituted for it.

In Section 11 of H. R. 7837 (Section 10 of the Act) the Comptroller of the Currency was to perform his duties under the general direction of the Secretary of the Treasury *acting as chairman of the Federal Reserve Board*.

In the Act as passed the words "acting as chairman of the Federal Reserve Board" were stricken out, showing an intention to distinguish clearly between placing the Comptroller under the Secretary as head of the Treasury Department and the Secretary as ex-officio chairman of the Board.

The most significant change made in H. R. 7837 by the Act as passed was the insertion, in Section 10 of the Act, of the following clause:

Nothing in this Act contained shall be construed as taking away powers heretofore vested by law in the Secretary of the Treasury which relate to the supervision, management, and control of the Treasury Department and bureaus under such department, and wherever any power vested by this Act in the Federal Reserve Board or the Federal reserve agent appears to conflict with the powers of the Secretary of the Treasury, such powers shall be exercised subject to the supervision and control of the Secretary.

It is evident that, while the purpose of this clause was, amongst other things, to insure the preservation and supremacy of all existing powers of the Secretary of the Treasury in all cases where it might be claimed that such powers overlapped, or conflicted with those of the Federal Reserve Board, nevertheless, by this very provision of the Act clearly recognized the existence of powers of the Board independent of the Secretary in cases where no such conflicted existed. Very respectfully,

(Signed) T. W. GREGORY.
Attorney General.

ECONOMIC NOTES

The Foreign Trade of the United States in November.—The monthly report on foreign trade issued by the Department of Commerce covering the trade position of the United States during November shows a continued increase in the excess of exports over imports. November, 1914, imports fell off in value $22,000,000 from the value for November, 1913, while it will be remembered that October, 1914, imports were $5,000,000 in excess of the value for October, 1913. The exports for November, 1914, were $40,000,000 below the mark set in the corresponding month of 1913, while exports during October, 1914, were $76,000,000 below those in October, 1913. The decrease of $40,000,000 in the value of November, 1914, exports was again due almost entirely to the falling off in cotton shipments which showed a decrease in value of

$71,000,000 from the November, 1913, figure. There was a net increase in exports of other articles amounting to $31,000,000.

The excess of exports over imports for the month was $79,000,000, as against a similar excess of $97,000,000 in November, 1913.

It is pertinent to note, as the year draws to a close, that the net export balance in favor of the United States for the first eleven months of 1914 is approximately $302,000,000 less than that appearing at the corresponding period in 1913. As will appear in detail below the export balance in merchandise exports was $193,000,000 for the first eleven months of 1914, as against $642,000,000 for the first eleven months of 1913. This leaves a balance against the 1914 figures of $448,000,000. This is partly counter-balanced by the excess of gold imports for the first eleven months of 1914, which amounted to $169,000,000, against an excess of gold imports for the first eleven months of 1913 of only $22,000,000. This leaves a balance in favor of 1914 gold exports of $146,000,000. Subtracting this from the merchandise balance standing against 1914 of $448,000,000, there remains the net balance of $302,000,000 referred to above.

The following table shows imports and exports by months during 1914 with the excess of imports or exports during each month, and also the totals for the first eleven months of 1914 and 1913:

FOREIGN TRADE OF THE UNITED STATES BY MONTHS, 1914.

	Imports.	Exports.	Excess.
November	$126,467,007	$205,766,424	Exp. $79,299,417
October	137,978,778	195,283,852	Exp. 57,305,074
September	139,204,267	156,188,790	Exp. 16,984,423
August	129,399,496	110,337,545	Imp. 19,051,951
July	160,178,133	154,082,225	Imp. 6,095,908
June	157,772,973	157,119,451	Imp. 653,522
May	164,281,515	161,732,619	Imp. 2,548,896
April	173,762,114	162,552,570	Imp. 11,209,544
March	182,555,304	187,499,234	Exp. 4,943,930
February	149,937,011	173,808,468	Exp. 23,871,457
January	154,469,263	203,799,517	Exp. 49,330,254
Totals, eleven months	$1,674,896,659	$1,868,452,265	Exp. $193,555,606
Eleven months, 1913..	1,608,829,114	2,250,929,517	Exp. 642,100,403

Imports of gold during November, 1914, amounted to $7,391,729, as against practically the same movement ($7,040,782) in November, 1913. For the eleven months of 1914 gold imports amounted to $53,278,678, as against $59,631,475 during the first eleven months of 1913.

Exports of gold in November, 1914, reached the total of $14,526,482, against $6,662,958 in November, 1913. For the first eleven months of 1914 gold exports reached a total of $222,485,232, against $81,226,017 during the first eleven months of 1913.

* * *

Foreign Trade of Italy During the War.—As one of the larger purchasers of United States products, and a considerable exporter of merchandise to this country, Italy's trade position since the outbreak of the European War is of interest. It appears from an account published in the "Economist," of London, that Italian commerce, in common with that of other neutral nations, has suffered heavily as a result of the war. The statement, in part, follows:

"That the great European crisis has had a very sensible repercussion on Italian international trade is clear from the following figures (in lire, 000 omitted):

	Exports			Imports		
	1913.	1914.		1913.	1914.	
First half-year..	1,903,595	1,842,766	— 60,892	1,209,425	1,273,799	+ 64,373
July	236,267	254,448	+ 18,181	182,862	190,820	+ 7,957
August	237,338	167,254	— 70,083	197,933	86,917	—111,016
September	264,462	102,290	—162,171	196,736	123,227	— 73,503

"The figures are for what is called special commerce, exclusive of transit trade, for which the statistics are not published until late in 1915. The October data are not yet available, so that it is impossible to say if the shrinkage has continued in the same proportion as in the first two months of war. The monthly statistics give a useful résumé of the special trade (i. e., exports of Italian goods and imports for Italian consumption), with the principal foreign countries. The figures compare as follows with the identical months of 1913 (in lire, 000 omitted):

	Imports in August and September		Exports in August and September	
	1913.	1914.	1913.	1914.
Austria-Hungary	38,959	16,119	26,855	8,471
Germany	82,821	55,831	49,989	12,446
Switzerland	13,444	8,118	43,266	23,408
France	33,396	13,373	35,700	9,176
Great Britain	82,974	61,006	41,045	40,608
Argentina	17,425	3,892	26,746	11,038
United States	58,187	43,521	38,666	41,774

"The most noticeable decreases are in trade with Austria-Hungary, France, Germany, Argentina and Switzerland. The trade with Great Britain and the United States has withstood the storm well, although it may be observed that the July figures are in part ante-bellum figures. In the main, the shrinkage of imports and exports is general: of the few exceptions, some are attributed to variations of the season which has an important bearing on the commercial currents of the agricultural products. Only potatoes, flour, rice, some fresh fruits and vegetables, eggs, too, appear to have been the gainers, in a small way."

* * *

Grain Crops of Russia in 1914.—According to figures published by the Russian Statistical Committee the total area under cereals, potatoes and pastures in seventy-three Provinces of Russia (all except Transbaikalia, Irkutsk, Amur, the Maritime Province, Kamchatka, Sakhalin, ten governments of Transcaucasia, the four governments of Turkestan, and Finland) was 355,865,130 acres, distributed as follows: Food cereals (wheat, barley, rye, etc.), 205,717,320 acres; oats, 49,514,760 acres; potatoes, 12,001,230 acres; natural pastures, 88,631,820 acres.

The estimated crop will be 63,712,600 short tons of food cereals (rye, wheat, barley, buckwheat, millet and corn). Taking into consideration the difference between the estimated and the actual crop (on the basis of calculations during the last nine years) it may be assumed that the crop of this year will be an average one.

The area under cultivation and the estimated yield of the various cereals in seventy-three Provinces in 1914, as compared to 1913, were as follows:

Cereals.	1913. Acres.	1914. Acres.	1913. Short Tons.	1914. Short Tons.
Winter rye	73,400,040	72,883,200	27,395,100	23,932,440
Winter wheat	17,416,830	18,259,830	8,873,280	7,757,280
Summer rye	1,571,670	1,525,770	481,680	416,880
Summer wheat	57,765,630	58,753,830	19,804,680	15,534,640
Oats	47,518,650	49,514,760	19,565,100	15,676,200
Barley	31,276,260	32,261,220	13,552,020	11,034,180
Spelt	529,740	553,230	.....	.....
Buckwheat	5,304,420	5,095,980	1,273,680	994,560
Millet	8,488,530	8,447,220	2,848,860	2,246,400
Corn, Indian	4,233,670	4,049,730	2,039,760	1,796,220

Deducting from the total amount of the estimated crop of 1914 the quantity necessary for the sowing of fields and the consumption by the population (calculating the latter at 540 lbs. per capita)

the Central Statistical Committee estimates the probable surplus of grain at 11,120,940 short tons.

It is expected that the State Bank will assist the realization of the harvest by extending the operation of loans on the crop, reducing the interest on such loans, abolishing certain taxes, etc.

* * *

Commerce of United States and Latin America.—Mr. John Barrett, Director-General of the Pan-American Union, has made public figures covering the Latin-American commerce of the United States, as recently compiled under his direction. Mr. Barrett stated that his figures were the first accurate ones to be issued covering the trade movement referred to, during the calendar year 1913. This was the first year, according to the statement made, in which the exports from the United States to the Latin-American countries exceeded those of Great Britain. During the calendar year 1913 the exports from the United States to Latin-America, and the imports into the United States from Latin-America exceeded those of any other single country. The figures issued by the Pan-American Union are, in part, as follows:

LATIN-AMERICAN TRADE, 1913.

	Imports from	Exports to
United States	$325,837,345	$477,628,500
United Kingdom	322,228,073	321,358,313
Germany	217,976,202	189,156,172
France	110,484,385	128,329,063
Total imports		$1,325,752,627
Total exports		1,539,123,597
Total foreign trade		$2,854,876,224

* * *

Acreage, Production and Value of Farm Crops.—On December 15, 1914, the Crop Reporting Board of the Department of Agriculture issued its final estimate of the acreage, production and value of fifteen important crops in the United States in 1914, 1913 and 1912. Crop values are based upon prices paid to farmers on December 1, 1914. The total value of the country's chief crops for the year is $4,945,852,000. This is more than $20,000,000 below the value for 1913.

The crops which showed an increase in value for the year over the value for 1913, together with the amount of the increase in round figures, are as follows: Corn, $10,000,000; wheat, $268,000,000; [illegible]; barley, $10,000,000; rye, $11,000,000; buckwheat, $2,000,000. Thus, the total increase in value for the crops named was $362,000,000. The crops which showed a decrease in value were as follows: Flaxseed, $2,000,000; rice, $200,000; potatoes, $29,000,000; sweet potatoes, $1,000,000; hay, $18,000,000; tobacco, $21,000,000; sugar beets, $5,000,000; cotton, $307,000,000. The total decrease in the crops named was $382,000,000. Subtracting the increase of $362,000,000 as outlined above, there is shown a net decrease of $20,000,000 in the total 1914 value of the crops, as compared with the value for 1913. It is obvious that the low price of cotton is chiefly responsible for the reduction in the total value for the year.

The following table, issued by the Bureau of Crop Estimates, gives the detailed figures for the 1914 crops, with comparisons with previous years:

(000 Omitted.)

Crops.	Acreage. Acres.	Production — Per Acre. Bushels.	Production — Total. Bushels.	Farm Value, Dec. 1. Per Bushel. Cents.	Farm Value, Dec. 1. Total. Dollars.
Corn:					
1914	103,435	25.8	2,672,804	63.7	1,702,599
1913	105,820	23.1	2,446,988	69.1	1,692,092
1912	107,083	29.2	3,124,746	48.7	1,520,454
Winter Wheat:					
1914	36,008	19.0	684,990	98.6	675,623
1913	31,699	16.5	523,561	82.9	433,995
1912	26,571	15.1	399,919	80.9	323,572
Spring Wheat:

INSURANCE

Articles on the Theory, Practice and Experience of Insurance

Notes on Insurance, American and Foreign

Items of Insurance News

CHRISTMAS is or should be peculiarly the season of gladness and thankfulness for those whose life-work is insurance. For those engaged in most other forms of business there may well appear to be some rift, some inconsistency, between the ends and aims of their daily occupation and the spirit of Christmas. Looked at superficially, the spirit of most business is strife, or what we call competition; and its object is victory in a hard-fought struggle for life. When Christmas comes around, most men of business must somewhat violently turn away from their own customary thoughts and feelings in respect of their business, and endeavor to substitute for them something that is their very contrary. The spirit of Christmas is intolerant only of strife and of the desire for victory over rivals and enemies. Peace and love are the handmaids of the spirit of Christmas. To give and not to take away, to assist and not to defeat, to share and not to gain for one's own,—these are the motives that harmonize with the spirit of Christmas; but these are too seldom the motives that men are conscious of in themselves in the pursuit of their business. Hence they must become in a sense not themselves in order to enter into the spirit of Christmas.

But insurance has this immense advantage over other forms of business, as regards the easy entering into the spirit of Christmas, that its very substance and essence are summed up by the words, "Bear ye one another's burdens." The time has now happily gone by when that conception of insurance was tolerated which made it, on the part of the insurer, a gambler's sale of indemnity for the ills and accidents and losses of our human lot. We now know that whenever we pay an insurance premium we are simply making our contribution to the loss of some one or more of our fellow men; and that even as we are making this contribution, some of our fellow men are making their contributions to our own losses, in case we should have them. We and they are co-sharers of the inescapable risks of life; we and they are conjoined in the relief of those among us for whom these risks are translated into sad realities. And between us there can exist no strife, nor divergent purpose, nor passion for individual victory and its fruits; our interest is mutual and common, the gain of one is the gain of all, our achievement is the general good. Among us reigns peace and good will; we cannot clash; we cannot hate; we cannot seek to destroy; for we are members of one body.

Such is the very substance of insurance, as the world now more and more realizes it to be. And what else is Christmas but the world's annual recognition of the superiority of this substance over the substance of all the other things in life? So, among all businesses, the business of insurance stands out as having to do peculiarly with that which is symbolized by the Christmas season. It alone among businesses is pursuing its one and only aim when it strives to bring mankind into a strifeless, a peaceful, a loving and utterly unselfish community of effort.

But, it will be said, although it is true that the substance of insurance is co-operation and community of sacrifice and endeavor, yet the business of insurance is as competitive as any other. Those who gain their livelihood by means of insurance strive one against the other as fiercely and relentlessly as do any members of the business world. Though they may be unconscious instrumentalities of the unselfish co-ordination of struggling men, that these may work together, at least on one side of their lives, for a beneficent end, yet their own purposes, and the motives by which they themselves are actuated, remain as alien from the spirit of Christmas as are the purposes and motives of the rest of humanity. That there is an element of truth in this allegation cannot be denied; and yet it is well to remember the great truth which wise Shakespeare pointed to, when he remarked upon the color of the dyer's hand, that it is at last "subdued to that it works in." The mind of the man who sincerely works in insurance cannot but become imbued in time with the essential purposes of insurance. And if the public activities of the great masters of insurance in our time are recalled to memory, it will be seen how large is the element of truth in this statement.

The world to-day is filled with the horrors of war. The deadly shock of nation against nation, the rage of combatant against combatant, the agonies of merciless strife, the abomination of the desolation of ravaged and ruined lands and cities,—these fill all minds and almost obliterate the very thought of peace and common human kindness. It is as though the spirit of Christmas had departed from mankind. None can foresee, moreover, the manner of return to mutual confidence and mutual endeavor, whether among the warring nations or among their citizens. All are looking for some great agency which may be turned to for the restoration of the wholesome and beneficent activities of the distracted world. But there is no such agency yet discovered; and no other way appears to lead to peace except the old and desolate way of the sword kept unsheathed until the conquered, unnerved by wounds and death, yield to the mercy of the conquerors. Again, as so many times in the harsh centuries of the past, the barbarous and cruel words, *Vae victis!*, must echo through the world.

Is there then no remedy for the hopelessness and unutterable misery of the earth's peoples striving to win each "its place in the sun" through strife and hate and death? It is a strange thing that at the very moment when every thinking person is asking himself this question, a philosopher should come forward to tell us that a way can be found,—indeed, has been found, if only it be followed far enough,—to avoid this loathesome expedient, war, upon which the peoples of the earth now rely in their effort to live more abundantly. And the way is the way of insurance. Every person engaged in insurance should read at this Christmas season the little book of Professor Josiah Royce, "War and Insurance," of which mention was made in these columns some weeks since. Whatever may be said of the immediate practicability of the specific plan proposed in this book, no one whose days are spent in the business of insurance can read it without deriving from it a new conception of the place he is filling, wittingly or unwittingly, in the evolution of the race. The reader may think himself concerned only with what he can obtain for himself from the business of insurance, that he has no peculiar mission in the world, that his success is measured by the same standards as is the success of other business men; but when it comes over him, as it will upon pondering Professor Royce's words, that he and his fellows, with their business, constitute that great agency for the attainment of peace and good will on earth, for which the nations are eagerly and as yet vainly seeking, he will more and more find something precious in his occupation, something that will at once make him lift up his head with joy and pride, and stir him to great and more unselfish endeavor.

THE POSTAL LIFE AND FEDERAL JURISDICTION

By William R. Malone
President, The Postal Life Insurance Company

THE business of life insurance as usually conducted through various local agencies, extends beyond the border of the State in which a company was organized, into other State jurisdictions and the business has thereby become unquestionably interstate.

Representatives of a company using the agency method actually exist in these States, and such a company becomes subjected, therefore, to the jurisdiction of other States than the one which created it. Business is transacted with the Postal Life Insurance Company of New York by citizens of the various States, but these transactions are always through the mails, and no representatives of it exist in other States; the Postal Life Insurance Company therefore does not become subject to the various State jurisdictions. There can be no question that its business as conducted is purely interstate, but being limited direct from the citizen to the company and direct by the company to the citizen, the mails immunize such transactions from State interferences.

Mr. Hegeler, the president of the New York Life Insurance Company, made a determined and most laudable effort to have insurance declared by the United States Supreme Court interstate commerce, expecting to upset the doctrine laid down in the famous case, "Paul v. Virginia" and so held for fifty years. The Supreme Court divided on the question in the Spring of this year, in determining the merits of what is known as the "Deer Lodge County" case, which came before the Court from the State of Montana.

At present, so far as the decision of the Supreme Court can establish a doctrine, life insurance is not interstate commerce.

It is proposed now to amend the Constitution of the United States so as to gain for life insurance transactions of every company which they possessed the right, State, Federal regulation. The form of the amendment, as proposed by Senator Spooner, the New York Life's counsel in the matter, is as follows: "Congress shall have power to regulate the business of life insurance corporations in a State other than that in which it was created."

With this proposed amendment, a New York company, [illegible] would be exempt from the various [illegible] imposed upon it by the present forty-odd [illegible] jurisdiction—that of the [illegible] by it the business transacted [illegible] would be regulated and supervised.

[illegible] the real legal status of [illegible] would change the attitude of the [illegible] toward it and the unfortunate [illegible] foolish views and [illegible] would give relief to other [illegible] over many States. The Postal is [illegible] with this effort by Federal legislation.

[illegible] Counsel bases his argument [illegible] which the Postal has always pointed to the people [illegible] for the method which it employs in conducting its business. Article 4, Section 2, Rights of the States, Interstate Commerce: "A citizen of one State [illegible] shall be entitled to all privileges and immunities of citizens in the several States."

The Postal has also called attention to Article I, Section 10, Commerce, Prohibitions upon the States: "No State shall pass any law impairing the obligation of contracts," and Article 14, Constitutional Amendments, Section 1,—Civil Rights: "No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States."

It is important to observe that under the Constitution as originally adopted, the upholding of rights of citizens was stated in an affirmative form and eighty years thereafter was again stated, but to make it more emphatic, in the negative form, lest by any devious construction, a State might tyrannize even over the black man.

As early as 1791, after the adoption of the Constitution, the need of amendment (Article I) was felt, which reads in part: "Congress shall make no law abridging the freedom of speech or of the press," which permits policyholders of the Postal everywhere to speak for it and the mediums of publicity to carry its advertising announcements everywhere.

The Postal in disseminating its business tenets very properly points also to this amendment of the Constitution as embodying a fundamental right belonging to a citizen which not even Congress itself can interfere with. The Postal has called attention, in an emphatic way, for nine years, to these rights which citizens possess and of which they cannot be deprived. It is asserting nothing special or new for itself as a corporation: it has only been expounding the doctrine of conceded civil rights. It seeks to make plain that a natural person has inviolable constitutional rights; that a corporate person has distinct but only statutory rights. What the Postal as a corporate person cannot do, like, for instance, going unhindered into another State, the natural person can do by right of the fundamental law.

The Postal continually publishes that it is subject to the supervision of the State of New York within the State, and without the State, since its business is done through the United States mails, it is subject to the United States postal authorities and to the Federal Courts, and voluntarily accepts a summons mailed to it by the proper officer of any United States District Court, wherever located. It means to conduct, and actually does conduct, its business with decisive economies in the State of New York; as it does not go outside the State to transact business, it thereby avoids coming under the expensive taxation and other requirements. Whoever deals with it does so directly. It announces to the public the economies of this direct method and wins to itself as policyholders residents of other States. They have the right to come to the Postal; while the Postal cannot go to them through a personal representative, it can reach them in another way—it can send to them or receive from them through the mails, the information sought for. After having entered into the insurance agreement, it forwards the policy through the mails to the owner. This is the distinctive feature of its method,—a citizen has the right to negotiate for its policies; he has the right to qualify for its policies; he has the right to buy in the best market; he is a citizen of the United States, and being such, no State can enact any law that abridges the privileges and immunities with which the Constitution has endowed him or which it has guaranteed to him.

Either the so-called Byrnes, Carter or Jones Bill, introduced in Congress last Summer proposing to forbid the use of the mails to a citizen seeking an insurance contract from a non-resident company which has not entered his State will fail of its purpose through the easy scrutiny of any competent court.

What the Postal Life is exempt from, without constitutional amendment, every other company will be relieved from, with the proposed constitutional amendment,—namely, the tolls of forty-seven States. These tolls aggregate annually about $16,000,000,

and but 4 per cent of the money collected is used for administrative purposes in the several States. The Postal declares that without any of this additional expense there is a general but effective Federal supervision now over it, since it uses the mails and employs no local agents in the conduct of its business. The enforcement of the postal regulations of the Government results in a Federal supervision, which, coupled with the strict home State supervision, is amply effective for all purposes of security to the public. With a company employing agents, the situation is different, as the business is not done wholly through the mails, but partially and largely through traveling or local representatives, domiciled in many States. Therefore, Congress in the exercise of a power to regulate the business of insurance outside a company's home State, if this amendment should be adopted, will create or empower a Federal department, and from it supervision of a distinctly Federal character will emanate. This single department will displace the expensive forty-seven other jurisdictions which a company in employing the agency method, undertaking to do a national business, is now compelled to subscribe to.

Another anticipation proclamation being about due, the heralds of the gods point with significant meaning to the shackles on life insurance.

FIRE INSURANCE AS A BUSINESS NECESSITY

IN the issue of THE MARKET WORLD AND CHRONICLE of December 19, attention was called to the rapid growth of the federation movement among insurance men; and two letters were published, representing the campaign of publicity initiated by Mr. O. P. Rutledge, Secretary of the Insurance Federation of Missouri. The letters were issued to the newspapers of Missouri. A third letter is now available and is given in full below.

* * *

Third Letter.

Principal Producing Causes of Fires and the Remedies.

If the office of Fire Marshal is created by the next Assembly, the Marshal will no doubt be required to make investigations, not only of all fire losses, but inspections of all classes of fire risks as well.

The Marshal should be a "big" man, an honest and fearless man; one who possesses more than a superficial knowledge of insurance contracts and insurance law. He should know a great deal about construction and its cost as applied to buildings and insurable structures, as he no doubt will be expected to discover dangerous conditions and have the power to order their removal. While he may not be a merchant, still he should know almost as much about the quality, cost and selling value of merchandise as the merchant. He will no doubt be required to prosecute cases of arson, but as that affects only a small part of the total number of fires, he should be required to investigate all fires and ascertain the causes and conditions which lead to the destruction of property by fire and encourage improvements and removal of defects. He will probably be required to collect statistics, and analyze the causes and motives which operate to cause fires. He should be qualified to educate the people of the State in practical fire prevention. Any immediate reduction in the fire waste must come through rigid inspection and education of the public as to the necessity for the removal of the temporary conditions which cause the greatest number of fires. His office will necessarily require him to go deeply into the questions of physical, moral and temperamental hazards.

In a former letter we treated the subject of moral hazards and the motives leading thereto. In this we shall confine ourselves chiefly to the temperamental type.

Our definition of "Physical Hazard" as the cause of fire inherent to inflammable material and its use, such as construction of buildings when wood or other highly burning substances are used, the hazards of chemicals, machinery, heating, lighting, etc., may be assigned as the normal cause of all fires not incendiary, which term, as before stated, embraces the four motives described in our second letter, in which they were analyzed at length. We dwelt on temperamental hazards also, saying that to be a state of mind careless as to the cause of fire and indifferent as to remedies to be applied. Under this head may be found by far the greatest numbers of fires involving the greatest volume of waste by fire, and, as it is in this class that the greatest number of preventable fires not intentionally produced are to be found, it is therefore proper that we should give greater consideration to this hazard and bring to light some of its hidden characteristics, as follows:

First.

Recklessness, habitual in character, in the use of combustible materials, such as cotton, various fibres and fabrics; combustible explosives, such as volatile oils, gasoline, ethers, alcohols, powder, gun cotton and other chemicals; lack of care in chimneys and flues; cleanliness of premises, especially basements, upper floors and garrets and rear of buildings. Recklessness is one of the chief characteristics of the American people, not only as regards fire, but in other phases of life, as is evidenced by the great loss of life and property in the different callings in which men are employed. A mental attitude of that kind scoffs at protective measures and considers a fire as a mere incident of life. A long course of education will have to be undertaken, beginning with the child, imbuing him or her with the conviction that fire is a dangerous element in any form, and that waste by fire, which could have been prevented, is a crime against society. The present generation of mature men and women are practically hopeless, and it will be necessary to throw around them laws of a restrictive character with penalties for violations.

Second.

America has been practically deforested, that is, nearly all of the best lumber-making timber has been cut off, and in our judgment lumber will never again be any cheaper than it is to-day. The American property owner has used wood in building houses for the reason that it has been the cheapest building material he could procure. Wood is the most inflammable of all materials used for building purposes, but the time is fast approaching when the builder will be forced to use material that will not burn; not from choice, perhaps, but because it will be the cheapest and will resist wear and tear of time and use the longest. Brick, stone or concrete will replace wood for walls, and tile, slate and metal will replace shingles for roofs. Fire districts in municipalities will be extended and a Good Building Code will govern the construction and care of buildings.

It is a serious, if not the most serious, aspect of the American mind that we are so ready to sympathize with and support the man whose property burns. The only cure for this mental attitude is for the public mind to grasp the fact that sympathy with an unscrupulous man or woman is a direct damage to society at large. Murder, robbery, all forms of brigandage and social perversions are so regarded, why not the man reckless in the care and use of his property against fire? The money required to reimburse him for his loss comes out of your and my pockets, a little out of yours and a little out of mine, every time his property burns. The hour that you take to read this newspaper will mark the destruc-

tion of $50,000 worth of property in the United States and Canada. You and I have to pay that $50,000, also the $50,000 for the hour following, and the next, and so on. Our contribution in each case may be quite small, nevertheless we pay the losses.

The insurance companies are only qualified trustees to receive and distribute our money, charging a reasonable fee for the service. They pay nothing of their own in any case. Their capital stock and net surplus belongs to them after all obligations are met and is created as a guarantee that yours and my losses will be paid if the other policyholders fail to pay. When we place burdens, taxes and restrictions upon them, we are burdening, taxing and circumscribing our own freedom and increasing the cost to ourselves on our own business by ourselves. When we come to view this question soberly we will find that the temperamental hazard goes far deeper and is of more importance than physical and moral hazards put together. Have we not, through a misunderstanding, held a wrong point of view as to these things? Insurance, being a distribution of losses, the premiums paid are really a mutual fund for that purpose. In stock insurance the management of this fund is under the control of the stockholders who pay in a definite capital stock and contribute a surplus, which latter is available for the payment of excessive losses, and in return receive a profit from savings in losses and expenses. In pure mutual insurance the fund is managed by the policyholders and excessive losses must be borne by them and the savings in losses and expenses may be accumulated in a surplus or returned from time to time to the policyholders. Insurance distributes losses in two ways: Ordinary losses are distributed upon all of the policyholders immediately and are paid out of the earned premiums in hand; excessive losses or conflagrations like that occurring last Summer in Salem, Mass., when over $12,000,000 worth of property was destroyed in one fire, must be met from the profits and accumulations in a surplus created in the interval between such dreadful occurernces. Sound insurance must provide for the ordinary as well as the conflagration hazard.

Insurance companies are not empowered to correct the mildest or the worst evils, the best they can do is to suggest them and their remedies.

We often hear that agents should be required to inspect the property before binding the risk under a contract of insurance. Prior inspections are of no consequence except on buildings and structures. It must be evident on reflection that a rigid enforcement of this rule would greatly increase the cost of the business. Pre-inspections of stocks of merchandise or other movable commodities would be a hindrance rather than a help, as the man seeking insurance for unlawful gain could and would produce the inspector's certificate that the value was there when the inspection was made, while the truth might be that the goods had been moved away to some other place before he set the premises originally containing them afire. Prior inspections on stocks of merchandise, household goods, etc., are worthless to prove the value after a fire. Real remedies may be suggested, their value is well known to insurance men and have been discussed by them many times:

1st. A fire marshal who is an officer of and is paid by the State, he and his deputies to be clothed with police power. We have already set forth his duties in this letter.

2nd. Policies covering in small amount (when new probably the full value) on household and kitchen furniture should not permit additional insurance. This restriction should be made by the company issuing the first policy, and a prominent notice to that effect printed on the face of the policy. The first company issuing a policy covering such property should be notified and asked to permit additional insurance before such additional coverage is granted.

3rd. The penal code of our system of laws should be amended so as to include fire and credit insurance under penalties for false statements as to the value of property for the purpose of obtaining insurance.

4th. The State, county and city authorities should make it plain that they will co-operate with the fire marshal and the insurance companies in defeating criminal and fraudulent claims.

5th. A valuable remedial measure would be to place property owners and tenants under penalties for the damage caused by recklessness, carelessness or criminality. The careless cigarette smoker should receive especial attention.

6th. Building ordinances or codes should be adopted and enforced in every State and municipality.

7th. The obligatory use of protective devices against fire, such as the use of slow combustion material, fire resisting and fireproof material, automatic sprinklers, etc., in large mercantile and manufacturing risks. Such a law is in practical operation in the City of St. Louis and has resulted in a constant diminution of fire losses in that city for many years.

The use of protective devices as suggested is forcibly brought home to us when we recall the Asch Building fire in New York City, where 147 lives were lost; the Binghamton, N. Y., fire, where 35 lives were lost, and the Missouri Athletic Club of St. Louis, where 39 lives were lost. All hotels, club houses and other public buildings where people eat and sleep should be sprinklered throughout the main lobby, hallways, stairways and kitchens, this requirement being for the protection of human life as well as property.

These requirements, followed by frequent inspections of the premises, will eventually cause a reduction in our fire waste and ultimately a reduction in premium rates.

My next letter will treat the subjects of over-insurance, coinsurance and premium rates.

PARENTS' RIGHT OF RECOVERY FOR ACCIDENT TO MINORS UNDER THE MASSACHUSETTS COMPENSATION ACT

IN the issue of this paper for December 19, 1914, there was presented an article by Mr. Malcolm J. Coan, of the Baltimore Bar, dealing with the question of rights of a parent to recover for an injury to a minor child, for which compensation had already been paid under a workmen's compensation act. A case has just been decided by the Massachusetts Supreme Court, completely substantiating Mr. Coan in his contention, and presenting so thorough an analysis of the point at issue that the opinion of the court is given below in full.

* * *

Philomene King v. The Viscoloid Co.

Sheldon, J. The defendant concedes that upon the agreed facts and the inference to be drawn therefrom, the plaintiff had a good cause of action, and is entitled to recover for the loss caused to herself by the injury to her son, unless her right of action is barred by the provisions of the Workmen's Compensation Act, St. 1911, c. 751.

It was undoubtedly the intention of the Legislature by that statute to take away from the employes who should become subject to its provisions all other remedies that they had against their

employers for injuries happening in the course of their employment and arising therefrom, and to substitute for such remedies the wider right of compensation given by the Act. But we find in the Act nothing which goes further than this for the protection of the employer. At common law, when this boy was injured, he gained a right of action for himself; and the present plaintiff, his mother, gained another and different right of action for the damage caused to her. The former action, that of the boy himself, has been taken away and a different remedy has been substituted therefor; but this does not of itself affect the second right of action, that of the boy's parent. That the boy received full compensation for the injury to himself does not affect her right to recover for her own loss. Wilton v. Middlesex Railroad, 125 Mass. 130.

The parent's right of action was not in any just sense consequential upon that of her son. It was independent of his right and was based upon her personal loss. His action was for the pain and suffering caused by the injury and for the loss of wages or diminution of earning capacity caused thereby and coming after he should have attained full age. Her action was for the expense to which she had been put by reason of his injury and for the loss of his services or wages, during his minority. It is true that the right of action in each case rested upon the same foundation,—that is, the fact that he had been injured by the negligence of the defendant. Under the provisions of the Act (St. 1911, c. 751, Part I, p. 5) he had waived his right of action; but he had not waived, by his own mere act, he could not waive, his parent's independent right. His waiver was by operation of law a discharge of his own right; but no discharge of his right could discharge or take away the right which had become vested in her, just as the election of an employe under Part III, par. 15, of the Act, to hold a third party instead of the insurer to compensate him for an injury does not take away a widow's right to hold the insurer for the employe's subsequent death caused by the same injury. Cripp's case, 216 Mass. 586. The express provision in the Act that his right of action is waived or discharged by his failure to give a notice that he claimed his common law rights is, by recognized canons of statutory construction, an indication that it was not intended to take away the right of any one but himself. The Legislature have stated the consequences that is to follow the failure to give the statutory notice; how can the court say that further consequences shall follow, by taking away the right of a third person not mentioned in the Act. Dubuque v. Dubuque, 7 Iowa 262. Page v. Bartlett, 101 Ala, 193. Perkins v. Thornburgh, 10 Cal. 189. Oxford Iron Co. v. Slafter, 18 Fed. Cas. No. 10, 637.

The provision that the insurer shall pay a part of the medical expenses made necessary by the injury to an employe (Part II, par. 5) does not take away by implication the parent's remedy in a case like this. Doubtless the parent could not recover for expenses which he had not been called upon to incur, and in fact had not incurred, but it is not perceived how this could have any greater effect than to reduce somewhat the amount of damages that might be recoverable.

This is not a case in which the plaintiff has taken any benefit under the act, which it might be conteded would estop her from making any claim inconsistent with the effect of that upon the employer. The insurer's payment of the medical and hospital bills was not, so far as it appears, or is suggested, made at her request, nor did it relieve her from any liability; for it does not appear that she had become liable for these bills. Our decision does not apply to cases where the parent has received any benefit or compensation under the Act. Nor do we decide that the plaintiff could recover for medical expenses which had been paid by the insurer, or for her son's services, so far as she had received, or was entitled and able to obtain for such services the amount paid therefor to him through his next friend by the insurer. These questions are not presented, for the amount of damages has been agreed upon.

It is probably true that the Legislature in passing this Act did not have in mind such a case as is here presented. It did occur to the Legislature of Rhode Island, and is provided for in the statute of that State. Rhode Island Sts. 1912, c. 831, Art. 1, par. 6. Whether our Legislature, if it had dealt with the question, would have made the same provision as was made in Rhode Island, or would have adopted some other course, is mere matter of conjecture.

In our statute there is no direct enactment taking away the parent's right of action, and we find nothing that takes it away by necessary implication. The Legislature simply have not covered the case, as in Parsons v. Merrill, 5 Met. 356. If they had chosen not to leave the parent's right of action unaffected, they might have taken it away altogether; they might have made some stated division of the allowed compensation between the minor employe and his parent; they might have provided (like the Rhode Island Legislature) that the election between the statutory remedy and that given by the Common Law should be made by the parent of a minor employe and should bind both parent and child. How can the court say which of either of these courses would have been adopted by the Legislature? It seems plain that neither one of them can be held to have been manifestly intended by the language of the Act. But we have no right to conjecture what the Legislature would have enacted if they had foreseen the occurrence of a case like this; much less can we read into the statute a provision which the Legislature did not see fit to put there, whether the omission came from inadvertence or of set purpose. See Hull v. Hull, 2 Strozh, Eq. 174; Kaukalman v. Gibson, 171, Ind. 503; United States v. Starn, 17 Fed. Rep. 435; United States v. Musgrave, 160 Fed. Rep. 700. This is the rule adopted in the construction of all written instruments, that no words can be supplied by construction unless it plainly appears what words ought to be supplied. To this recognized doctrine it is enough to cite Metcalf v. Framingham Parish, 128 Mass. 370; Child v. Child, 185 Mass. 376; Sanger v. Bourke, 209 Mass. 481, 486, 487; and Springfield Safe Deposit and Trust Co. v. Dwelly, ante.

It may be added also that another rule of statutory construction is that an existing common law right of action is not to be taken away by a statute unless by direct enactment or necessary implication. Melody v. Reab, 4 Mass. 471, 473. Commonwealth v. Beck, 187 Mass. 15, 17.

It has been suggested that the statutory compensation given to a minor employe is really a payment of wages, citing a detached sentence from the opinion of A. L. Smith, L. J., in Irons v. Davis & Timmons, Ltd. (1899 2 Q. B. 320, 322.) But this is not so. The *quantum* of the compensation is measured by the amount of the wages; but the payment is in place of all the rights of action belonging to the injured employe, and covers suffering and temporary or permanent disability as well as loss of wages. This is plainly so in the allowance for permanent physical disability under Part II, par. 2, though that, too, is measured by the amount of wages earned. So, too, whether the injury is due to the serious and wilful misconduct of the employer or superintendent. Par. 11, par. 3.

Under the terms of the report in the opinion of a majority of the court, judgment must be entered in favor of the plaintiff in the sum of fifty-four dollars and sixty cents, with interest from the date of the writ.

So ordered.

NOTES ON INSURANCE, AMERICAN AND FOREIGN

Mutualization of Prudential Life Nearly Completed.—The completion of the legal processes required for the mutualization of the Prudential Insurance Company of America was accomplished on Tuesday, December 22, when Chancellor Walker, in the Court of Chancery of New Jersey, at Trenton, N. J., approved the plan, as it had been formulated by the directors of the company, and then accepted, first, by the shareholders, and finally by an overwhelming majority of the voting policyholders. No objection whatever was raised by any party at interest at the hearing before Chancellor Walker on Dec. 22. The actual carrying through of the plan by the payment to the shareholders of the amount agreed upon as their proper share of the accumulated surplus will be a short one, and soon after the beginning of the New Year, the Prudential will have become a completely mutal life insurance roganization.

* * *

Ruling by Commissioner of Internal Revenue.—According to press dispatches from Washington, under date of December 22, the Commissioner of Internal Revenue has decided that the policy loan agreements made out by life insurance companies to secure themselves for advances on policies are not subject to the emergency revenue law. The agreements evidencing such loans are usually in the form of conventional promissory notes, but they contain other provisions inconsister with the general character and functions of promissory notes and negotiable paper generally. The Commissioner holds that such agreements are not promissory notes in the meaning of the law. It is also held that notes extending the time within which the insured may pay his premium do not fall within the meaning of the law.

* * *

Shall Policy Loan Applications Be Deferred?—Under the above title, Mr. Ernest M. Blehl, actuary of the Philadelphia Life Insurance Company, has contributed a brief article to "Plico," that company's monthly agency paper. It is of such general interest, as looking at the subject from the standpoint of the insurance company, that we reprint, in full, as follows:

"At the recent convention of the Insurance Commissioners sentiment appeared to be in favor of requiring the policyholder to give insurance companies six months' notice if a loan is desired, except where the loan is to be used for the payment of premiums. In other words, if a policyholder desires to make a loan on his contract, the Commissioners seemed to think that the companies should require a period of six months to elapse before the actual cash proceeds are paid. One of the Southern Insurance Commissioners wrote the company calling attention to this matter and asked for an opinion.

"The idea in the mind of the Commissioners appears to be that it is not good practice for policyholders to be permitted to jeopardize their policies by loading them with indebtedness; that if the insured has difficulty in getting along without making loans on his policy, he will have greater difficulty to pay interest charges on the loans, and that the borrowing of money on insurance policies leads very often to their cancellation. There is, of course, considerable force in the argument of the Commissioners, but after a careful review of the subject we thought that the contemplated legislation would be imposing a hardship on policyholders, and we, therefore, answered the letter that from our standpoint we saw no particular emergency for requiring reservation of the right to grant policy loans for a stated period. This company has passed through the panics of previous years, and is now encountering, as are all other businesses in the country, a period of great stringency of money. On none of these occasions has it been unable to meet all demands on it for funds, and it has satisfied the desires of its policyholders up to the limit of their equities, and has been able to do this without having to borrow any money for such purposes. A money stringency is bound from its nature to be merely temporary, premiums are constantly being received by the insurance company, experience has shown that not every one wants to borrow on his policy and expedients are on every hand for a solvent company for meeting any reasonable demands which may arise.

"As a general proposition, the maximum policy indebtedness does not consist of much more than 5 per cent of the amount insured, so that of the total amount of insurance outstanding, the amount of loans is a comparatively small proportion. This may not be true of individual policies, but, as a matter of public policy, the loans made on insurance policies do not materially affect the amounts which are to be paid the beneficiaries in event of death.

"Loans are objectionable because the insured is borrowing from his beneficiary; he is destroying the estate which he has taken such pains to establish; if the loan is made the insured has more difficulty in taking care of the premiums and interest charges than in taking care of the premiums alone; a loan is frequently the prelude to a lapse. For all these reasons this company is somewhat reluctant in granting loans to its policyholders.

"We have found out, moreover, that the accommodations so accorded are at times of great value to policyholders, and it may be a grave question whether the excluding of the right to make a demand loan would not be a deterrent against taking new insurance, and whether in event of a loan value not being available the insured would not seize the first opportunity for surrendering his policy for cash. It is probable that these two opposing influences may be more than sufficient to counteract the good effects which the Commissioners' plan might bring about in event of establishing a six months' reserve period before the loan is completed.

"Life insurance, it has often been stated, has been subjected to more statutes and rules than are good either for the company or the policyholder. Lack of uniformity in legislation has, however, caused interminable trouble and confusion, and companies doing business over widely extended territory find it necessary to have many different editions of their policies to conform to the varying insurance laws of the different States. The requirement by certain States of additional policy provisions simply means the adding of a new policy form to the long list now required to be published. No good purpose is served in complicating the policy forms, and, on the contrary, efforts should at all times be made to reduce the policy forms to a standard basis.

"If it is required by statute or where the Commissioner has the authority and he demands it, this company will, of course, follow the law, and if necessary insert a six months' reservation loan clause in its policies in those States where this is required. For the reasons which have been stated above, however, we do not see the emergency for such a condition to be contained in the policies, and would prefer to give our policyholders every accommodation which can be safely accorded."

* * *

Deferred Life Insurance for Children.—The "Insurance Observer," of London, in a recent issue makes the following interesting comments on the subject of deferred life insurance for children:

"Just at the moment when sections of the public—not all, by any means—are having to consider ways and means, attention may properly be called to the various schemes which have been devised for the assurance of children. These policies, which are now offered by most offices transacting life assurance business are

inexpensive, and they possess one special advantage which should never be overlooked; no medical examination is required. Recent events have proved that life assurance is an imperative necessity for every male, if not for every female as well; and there is no certainty that life assurance will be possible when the child attains the age of twenty-one or twenty-five years, as the case may be. The healthiest child of to-day may be uninsurable, except at a largely increased premium, when he or she becomes an adult; and, furthermore, there is the possibility of extra premiums being imposed for other reasons, such as occupation or intended place of residence. Life assurance companies, however liberal they may be to their supporters, cannot afford to be philanthropists, inasmuch as the interests of the entire body of policyholders have to be considered. If the young man has joined the army or navy, or has made up his mind to reside in some tropical region, it is not to be supposed that life assurance will be granted him on exactly the same terms as to the civilian who is earning his living at home. All these possible difficulties are surmounted when the parent has been prudent enough to insure his offspring in early life. In practically all cases there is then no restriction in regard to domicile or occupation, and the policy—provided premiums continue to be paid—remains in force, although most hazardous work may subsequently be undertaken.

"As a matter of fact, these policies usually afford the most complete protection in after life, and the charge made for them is within the reach of most, if not all, parents. A table printed in the prospectus of the old London Assurance Corporation may be taken as a fair sample of the rates quoted. For a whole life assurance of £1,000, payable at death after age twenty-one, the yearly cost in the case of an infant which has not attained its first birthday is only £9 with profits, or £7 without profits; while an endowment assurance for the same amount, payable at age fifty or death, costs £13 3s. 4d. or £10 14s. 2d, respectively. As the age of the child increases, so, of course, does the amount of the premium payable, but the advance in rates is gradual, and not very rapid, as the following table shows:

Age at Next Birthday.	Whole-Life Policy, Payable at Death, After Age 21 — With Profits.	Whole-Life Policy, Payable at Death, After Age 21 — Without Profits.	Endowm't Assur. Payable at 50, or Death After Age 21 — With Profits.	Endowm't Assur. Payable at 50, or Death After Age 21 — Without Profits.
5	£10 7 6	£8 0 10	£15 8 4	£12 10 10
10	12 10 10	9 14 2	19 1 8	15 9 2
15	15 6 8	11 18 4	24 2 6	19 10 10

"One has only to compare these rates with those quoted for similar whole-life and endowment assurance at age twenty-one and later years of life to realize how splendidly the young man is equipped who begins his business or professional career possessed of one of these policies. Life assurance—a necessity—is not going to cost him nearly such a substantial annual sum as it will the man whose parents had neglected an obvious duty. A part of his income, however earned, will consequently be available for other expenditures, and his chances to succeed will necessarily be greater. It can truthfully be said, indeed, that the purchase of one of these policies constitutes the very best gift that a father can make to his son. And the cost, it must be remembered, is not considerable; nor the risk run very substantial. Should the child die before reaching the specified age all premiums are returned to the person effecting the assurance, and after two years' premiums have been paid surrender value on a liberal scale can be obtained."

English Compensation in the Law Courts.—Figures recently issued in England in a Blue Book, covering the working of the Workman's Compensation Acts and the Employers' Liability Act in 1913, show that the total number of cases under the Employers' Liability Act, 1880, taken into court show clearly the tendency of the remedy provided by the older Act to fall into disuse since the Act of 1906 came into full operation.

Year.	Total No. of Actions Under the Employers' Liability Act.	Amount of Damages Awarded.
1898	879	£18,733 1 8
1899	659	11,103 2 10
1900	669	11,989 13 6
1901	762	12,184 3 4
1902	729	9,899 9 6
1903	689	14,835 18 10
1904	759	12,986 14 3
1905	634	9,332 3 8
1906	649	9,724 11 2
1907	604	8,954 2 4
1908	405	5,476 3 1
1909	298	6,298 16 11
1910	217	3,500 0 10
1911	223	4,297 8 7
1912	197	2,531 0 0
1913	171	2,442 3 6

INSURANCE NEWS IN THE WEST

Report of the Missouri Fire Insurance Commission.—The Missouri Fire Insurance Commission made public its report this week. This commission was appointed last year at the time the companies resumed operations in the State. The report is regarded as a very strong document, showing that the members of the commission were able men and did careful, thoughtful work.

The recommendations may be summarized as follows: The companies are to maintain and operate rating bureaus, the rates and rating records to be public and under inspection and supervision of the Insurance Superintendent. All companies, including mutuals, must either subscribe to this Bureau or maintain their own rating records. While companies may not combine and agree to follow Bureau rates, each company is required to adhere to the rates it files, whether Bureau or its own. Anti-rebate and anti-discrimination laws are recommended.

The Insurance Superintendent may remove discrimination on written complaint and after hearing. Otherwise he is not to interfere with the rates until it may appear that they give an excessive profit. A general reduction may be ordered when experience for five years shows an excessive profit. Reduction orders are subject to court review, pending which companies may collect the rates they deem proper, holding the difference in trust to be returned to policyholders if the reduction is approved by the courts.

* * *

Proposed Compensation Law for Oklahoma.—The Oklahoma Manufacturers' Association has proposed a compensation law for that State, following in the general lines of the National Civic Federation bill, though differing from it in a number of important points. It is admitted, however, that before a compulsory bill of this character could become a valid law the Constitution will have to be amended, as it expressly prohibits any statutory limitation on the damages that may be recovered for a death. Relations between officers of the Manufacturers' Association and those of the State Federation of Labor seem to be strained, and a fight is likely over any bill for workmen's compensation that may come up. The manufacturers' proposed measure provides for an independent commission of three to administer it, while labor at the last session demanded that administration be by the Department of Labor. The manufacturers want four options of insurance, as in New York, while it is understood labor leans strongly toward State monopoly of insurance.

* * *

Tendencies in the Agency Field in Chicago.—Recently an insurance broker who has been in business in Chicago for 15 years or

more and has been a keen observer of what was going on made the assertion that within five years there will not be a commissioned agent left in the down town district. After argument he modified the statement somewhat. His idea, however, is in line with those of some others who are watching the trend of affairs. Recently a broker was approached on the subject of becoming a partner in an agency. He promptly wanted to know whether it was proposed to run on a commission basis or endeavor to get the management of a salaried branch office, as he preferred the latter because he regarded it as more likely to be permanent.

Men who have no financial interest at stake express the opinion that more and more companies will go upon the branch office plan. The broker is an extremely important factor in Chicago insurance now. The year just closing has been a hard one for him. He has seen the branch office managers inclined to give him all the commission and accommodations they could. The company pays for this generosity. The local agents, on the other hand, paying their own office expenses and desirous of making something on the business they transacted, had to bargain more closely with the broker. According to one broker, who is believed to know what he is talking about, the brokers are inclined to look upon the branch office managers as their friends, and to have a preference for dealing with them.

According to one broker various devices are in use to pay more than board rules permit to brokers. He may be mistaken about this, but it is his belief and he says that it leaves the agents who indulge in this practice so little profit on the brokerage business they handle that they cannot continue to do business on so narrow a margin.

Probably no intelligent insurance man in Chicago would predict seriously that certain of the fine agencies doing a good business, most of which consists of the personal writings of the members of the firm, will continue and grow greater. But with the agents that have not a personal business the case is different. No scheme short of State insurance is likely to put the producer out of business. In practicing economy the middleman is the one who gets pinched. The smaller agent who does not control business personally and who has not the volume to enable him to maintain the splendid service organizations the larger agencies have, is in a difficult position when called upon to state economic grounds for his existence.

* * *

Dissatisfaction with Ruling of Chicago Board of Underwriters.—Dissatisfaction has been expressed in some quarters of late with the rule of the Chicago Board of Underwriters under which men who have been class 1 members are continued in that capacity after they have lost the sole agency on which they originally were admitted to membership and have secured none to take its place. There are several such members. If they were out of the Board they could be admitted only to the brokerage class as they are not agents of any company. Yet, because they were agents at some time in the past, they are accorded full privileges as members.

Ordinarily there probably would be no objection to this plan, but one or two instances have arisen where agents of this peculiar status have been leaders in movements obnoxious to the companies. Accordingly, the question has been raised whether it is not inconsistent that a man accountable to no company and subject to discipline by none should have the same privileges in influencing the action of the Board as those on whom their companies could bring pressure if they thought the occasion demanded such action.

* * *

Some of the large casualty offices in Chicago—and doubtless in other cities in States that have had compensation laws in force for some time—are closing the year with a feeling of poverty. In 1912 the first high compensation rates were in force and premium incomes were large. The next year special rating tended to reduce them, but the acquisition of new risks helped out. This year merit rating and a new manual have both reduced rates materially and payrolls have been so reduced that excess premiums coming due are much smaller than usual and in some cases are minus quantities. In addition the mutuals and interinsurers have made more serious inroads.

* * *

The constitutionality of the Iowa workmen's compensation law was before the Supreme Court of the State last week, and a decision is expected at the January term, if not before that. The case came up on appeal from a ruling of a district judge that where an employer elects not to come under the law he cannot make a defense to charges of negligence, but the only question to be presented to the jury is the amount of damages.

The lawyers seem to think that the constitutionality of the whole law is involved and friends of compensation want an early decision so that the coming Legislature can correct defects if any are pointed out by the court.

* * *

Reports from Nebraska are to the effect that the compensation law, which became effective on December 1, is proving popular. During the first three weeks of its operation no employe filed his rejection of the act and fewer than thirty employers filed rejections. This appears to show that the referendum, which held the law up for over a year, was engineered by people who had a selfish interest, such as damage case lawyers, and by those not affected by the law, such as farmers.

* * *

Effect of Lorimer Bank Failure on Surety Companies.—When the Lorimer banks in Chicago closed in June, with over a million dollars of public funds on deposit, every surety company except one paid up promptly or as soon as certain legal questions were settled. It was thought that with this experience the Chicago city officials would look with greater favor on corporate surety. This has not proved to be the case, however. An effort has been made to get the highest possible rate of interest out of the banks, by dividing funds into those which may be drawn out at any time and those which city officials agree personally to leave with the banks for thirty, sixty or ninety days. The usual rate on savings accounts in Chicago is 3 per cent and most of the banks offered this rate for the "time" deposits. The rate on the other funds offered by most banks was 2¼ per cent. Where 3 per cent has been offered, it is understood that the larger banks do not feel that they can afford to pay one-half of one per cent for a corporate bond in addition to the full savings bank rate of interest. Thus the action of the city officials has tended to discourage rather than encourage the giving of corporate bonds.

* * *

On January 12 and 13 the National Association of Industrial Accident Boards and Commissions, which was organized at Lansing, Mich., last April, will hold a special meeting in Chicago. The main object is to adopt a uniform system of keeping records of industrial accidents so that the information obtained may be available in rate making. At the Lansing meeting, Cyrus W. Phillips, representing the National Civic Federation, advocated such action, pointing out that, as each State board is independent, the very valuable general statistics which should be secured from the operation of workmen's compensation laws could be secured in uniform and available form only by voluntary co-operation.

Chicago, December 24, 1914. LA SALLE.

FINANCE AND COMMERCE

Financial and Commercial Review

Banking Situation at Home and Abroad

Statistics of Cotton and Coffee

Market Prices of Securities and Commodities

NO such determinate stage has been reached in the European War as to permit it to be said that a new phase has been entered upon. Accordingly all business and banking calculations have still to be made subject to every uncertainty that war connotes. Indications are noticeable that developments may be impending which are likely to increase the scope of the war by bringing fresh nations into the conflict; this, in turn, would in all probability mean shortening the duration of the war. If the Balkan States patch up their differences it can only be for the purpose of joining with the Allies; and Italy seems to be awaiting a favorable opportunity to attack Austria. The pressure on the Hapsburg armies is tremendous and effective, and Austria's collapse may not be very remote. When that occurs the war will surely have reached a new stage in which Germany's ability to prolong the contest will be even more questioned than it is to-day.

In the meantime the voice of partisanship is uttering itself more aggressively than ever, and in this department of international controversy Germany is revealing more clearly than ever the weakness of its cause. The country is bankrupt in diplomacy, because it has for forty years been without a real domestic political life in which to cultivate genius for understanding the point of view of ore's neighbor and compromising with him. The underlying defect of the political organization is making itself unmistakably manifest in the apologia issuing from the mouths of accredited or volunteer spokesmen for the Fatherland. The present German mind is different from the mind of every other civilized people. It is the product of militarism and a state socialism dispensed by the Imperial Government to reconcile its subjects to political servitude very much as the old Roman Emperors placated the populace with bread and games. The outcome has been a mental growth fettered by official forms of truth. To be acceptable to Germans the "truth" had to be "Made in Germany." Sufficiently masters of psychology to appreciate the effect of forceful iteration, the German ruling cast and its agencies have manufactured in the past two decades an official brand of truth for home consumption, and spread it among the people, until now, Germans all the world over are denouncing as lies what most reflective observers of other nations are recognizing as facts.

The dialectic with which the German side of the war is being defended is as bankrupt as German diplomacy before the war. The illustrations of this are so numerous as to embarrass any effort to choose among them. For example, one might take the wild contention that Europe is making war because of the English purpose to shut Germany out of the world's trade, or diminish the German share of it. Heaven knows how many Germans there are who believe this in face of Germany's great commercial growth during the period of Great Britain's most extensive naval supremacy. Yet it seems to be one of the cardinal articles of current German faith.

Of course, the facts are that there is no nation in the world which lives so much by trade, and profits so much by the expanding trade of all nations, as England. One reason why British diplomacy and the British political genius have no equal is because they are so closely allied with the commonsense knowledge of economic principles which British business has acquired. England knows that trade makes trade and that England gains when any nation is able to increase its commerce in home or foreign markets. What the German trade indictment of British policy simply does is to show how weighty is the charge that the war now raging is the consequence of the atmosphere of mediaevalism in which Germans have been living their lives. The barbaric conception of promoting national interests and making German "kultur" prevail by force is purely mediaeval.

The mediaevalism of German militarism is matched and betrayed by the mediaevalism of German economic notions in which the accusation of trade-grabbing brought against England is founded. England was long ago cured of mercantilist fallacies. That is proved by the lessons of colonial administration which it has taught and which have redounded to England's advantage in the loyal support rendered by her colonies of all races in this hour of desperate extremity. Germany, however, is still groping in the dark abysm of the commercial past. German trade, in its organization and object, has been essentially monopolistic. What we call trusts are puerile trifles compared with the gigantic monstrosities of trade and industrial combination which the German Government has fostered and licensed at home. Everywhere that German trade has gone in the world it has been privileged to establish itself, even where the flag of British control has been flying, but from all markets comes the same story that nowhere has Germany been content with establishing its hold, and pursuing a live and let live policy. Germany now accuses England of forcing the war on economic grounds precisely because the essential idea of German trade is monopolistic and precisely because Germany is a trade grabber.

How soon American business is going to shake itself free from the lethargy into which it has settled down by way of reaction from the tremendous strain of the first three months of the war is a question. For our own part we have no doubt that recovery will start soon and that it will be a big recovery. But at the moment there is much depression. It is probable that this Winter will be the worst for trade and industry that the country has had in twenty years; but after the chronicle of February failures is completed, following the annual inventory and balance sheet period, things should begin to mend. There is an impressive prediction of improvement in the statement made this week by the finance committee of the United States Steel Corporation that for the time being general wage reductions would be postponed, even though they had recently seemed imminent and inevitable. This conclusion was reached after a canvass of the situation which led to the hope that conditions were in the way of improvement. The membership of the committee is a guarantee that its decision represents about as solid and well informed judgment on business prospects as could be evoked from the business community.

That the committee's opinion was guided very much by the ruling of the Interstate Commerce Commission in the re-opened Eastern rate case cannot be doubted. This is one of the most important contributions to the formation of optimistic sentiment respecting the outlook. Too much emphasis has been laid in market wise comment on the direct addition which the increased rates will make in net earnings. This addition will be large in time, when the railroads can obtain largely increased traffic; but for the present the most encouraging feature of the Commission's ruling is the right about which it marks in the general policy of regulation. The

great thing about the rate case decision is the evidence which it offers that the Commission has been jarred loose from an attitude which has been destructive of confidence in railroad investments, which is the investment standard for American finance generally The big break with the past is absolutely proved by the agonized protests of Commissioners Harlan and Clements against the agreement of the majority of the Commission.

These two distinguished dissenters represent the old tradition of Government regulation which demanded that the railroad industry must be more honestly, ably and efficiently managed than any other business in the country and yet reconcile itself with all the dictates of fancy and prejudice which politics could bring to bear on the regulating body. In all the vast imperfections of the organization of our Government on the economic side there never was anything more grotesque than the Interstate Commerce Commission's disastrous and stubborn insistence on prescribing conduct for the railroads which, in comparison with the conduct of freer private enterprise must measure up to a standard not 100 per cent perfect, but 100 per cent plus. In changing its attitude, the Interstate Commerce Commission has in effect agreed to allow a leeway of financial capacity by which a railroad can make adjustments to adverse conditions, however caused, very much as any other form of business must adjust itself. The result of this is that the railroads and their bankers can now appeal to investment support with confidence that funds will be forthcoming for the financial requirements of the carriers, and this means that before long the railroads will begin to place contracts for equipment and material. Their buying may furnish the initial impetus to move general business out of the rut of depression and start it on the road to recovery.

Among the matters which commanded attention this week was the opinion rendered by the Federal Attorney General that the Federal Reserve Board is independent of the Treasury Department. This does not take the new banking system out of politics; but it will help to limit Treasury aggression. Agricultural commodity prices have been rising strongly in response to export purchases, particularly in the case of wheat, and in the first nineteen days of December an export balance of almost $70,000,000 was disclosed by the aggregate of foreign trade returns from the principal custom districts of the country. The domestic money market has grown weaker and money bids fair to be excessively cheap with the outset of the New Year. Foreign exchange is moving more and more in this country's favor, and the international money market will unquestionably be able to finance a large return of our securities from abroad when their European holders are compelled to sell them.

BROAD STREET.

AMERICAN AND FOREIGN BANK STATEMENTS

NEW YORK BANKING INSTITUTIONS.

The most notable feature of the weekly statement of the New York Clearing House banks and trust companies for the week ending December 19, was the substantial increase in the amount of excess reserve. This increase amounted to $8,305,580. There was a decrease in both loans and circulation. All other items showed increases.

FOREIGN BANK STATEMENTS.

The first complete official statement of the Bank of France since July 30, is shown, as of December 10, in the ministerial budget. Circulation shows an increase, as compared with July 30 figures, from 6,683,000,000 francs on the earlier date, to 9,986,000,000 francs in December 10. The stock of gold remained practically stationary. Advances to the Government under the law of September 5 amounted to 3,600,000,000 francs.

COTTON

December 24, 1914.

IT is perhaps more than could be expected that the cotton trade should greet the Christmas holidays this year with the customary feeling of exhilaration. Good cheer there is, but it is the cheer of courage and readiness to meet the future hopefully, rather than the cheer of successes won and of efforts well repaid. It may be safely asserted that none in the trade will ever forget the anxieties, the disasters and the losses of 1914. Some have escaped more lightly than others, to be sure; but all have had to pay some share of the dreadful cost of the European War and many have suffered grievously. When a vast business like the modern cotton business has spread its delicate web over the entire face of the globe, the violent rending of any part of it means injury to every other part. Forethought and prudent conservatism are of no avail to prevent loss under such conditions. The interdependence of countries and of the citizens of countries, which is one of the most beneficent creations of modern times, assuming that universal peace prevails, becomes to the self-same degree maleficent, if peace must yield to general war. In the latter case each and every department of business whose activities extend beyond the confines of a neutral and non-combatant country must expect to have loss piled upon loss and to be obliged for no inconsiderable period to devote its energies to mere self-preservation, instead of to the normal conduct of its affairs. Without considering what may have happened to the cotton trade of the belligerent European countries, it may be said that the American cotton trade has had a year in which no thought could be given to aught else than the prevention of threatened losses and the repairing of damage already done, with sufficient rapidity to maintain solvency. Profits, naturally, there have been none, and long months, or even years, of effort must be looked forward to in many cases, before the status of a year ago can be reached again. In spite of these obvious truths, however, it is not a fact that the trade has suffered at all in resolution, that it has lost any part of its efficiency or enterprise, that it is less ready to undertake the responsibilities which it has so successfully carried in the past. In one respect its situation has even been improved by what it has gone through and by its manner of meeting its problems. The credit of the trade as a whole has never been so high as it is to-day; the probity and responsibility of its members have never before been so widely known and acknowledged; and the legitimacy of the economic service it renders has never before been so generally understood. Some degree of elation is permissible on this account; and the Christmas of a troublous and costly year brings with it this cause for satisfaction. And still another cause for satisfaction may be mentioned, though it is not so strictly of a business character. It is that the perils and harms of the past five months have revealed to the members of the trade the extent to which unselfishness, mutual help and disinterested endeavor for the common good may be carried among those who in theory and for the most part in practice are purely competitors one with another, each seeking his own advantage in all legitimate ways. No doubt the same spirit of mutual helpfulness has been displayed in many other departments of business, not only in the United States, but all over the world; but certainly it has worked no more beneficently than in the harassed cotton trade. And now the trade is thoroughly prepared to exercise all its powers in the solution of the problems connected with the advantageous distribution of what has turned out to be the most oppressively large production of cotton, since cotton became a world commodity. There can be little doubt now that the season's commercial crop in the United States alone will equal or exceed 16,500,000 bales, provided all that has been grown is marketed. The ginning figures of the Census Bureau issued early in the present week show the largest amount of cotton ginned up to December 13 of which we have any record,—13,977,189 bales, as compared with 13,727,428 bales last year and with 13,770,727 bales in 1911 when the final commercial crop was over 16,100,000 bales. We have now in the United States more cotton by some 3,500,000 bales that we have ever had before at the end of a calendar year. We must expect the comparative excess to increase rather than to diminish, even though from now on the absolute amount of cotton in the country slowly diminishes, as it must when the ginning season has virtually reached its end a month from now. The great problem, however, must still remain, how to carry along and gradually distribute this unusual surplus of cotton, without recourse to prices which all interests would regard as most unfortunate. The cotton trade is now fully prepared to undertake its part of this great task; and its chief regret is that it must face as best it may the obstructions and hampering perplexities of the new Federal cotton legislation, the so-called Lever Act, which goes into effect six weeks hence, but whose provisions no one as yet,—not even the Government officials who are charged with the administration of it,—understands or can expound.

THE CONTRACT MARKETS

THE NEW YORK COTTON EXCHANGE.

The MOVEMENT OF THE AMERICAN CROP.

The American crop year has been changed to run from August 1 to July 31, and all comparisons are made up accordingly.

The following tables, derived from the New York Cotton Exchange, show the movement of the American cotton crop for the past week and since August 1, 1914, with comparisons for previous years:

CROP MOVEMENT INTO SIGHT.

Weekly Movement.	1911-12.	1912-13.	1913-14.	1914-15.
Port receipts	347,204	265,134	320,900	On account of holiday, statistics are not available. Condensed weekly statistics will be given in the next issue.
Overland to mills and Canada	43,133	36,351	48,619	
So. mill takings, est., exclusive of takings from Southern ports.	100,000	100,000	105,000	
Gain of stocks at interior towns	13,439	40,451	23,922	
Brought into sight for week	503,776	441,936	498,441	
Total Movement—				
Port receipts	7,454,396	7,156,209	6,937,197	
Overland to mills and Canada	488 810	527.215	607,747	
Southern mill takings	1,432,032	1,405,873	1,474,796	
Stocks at interior towns in excess of Sept. 1..	785,524	680,699	734,248	
Brought into sight thus far this season	10,160,762	9,769,996	9,753,988	

The total crop movement is respectively for 151 days, 149 days, 148 days and 147 days.

SEVENTH COTTON GINNING REPORT OF THE SEASON

On Monday, December 21, the Bureau of the Census issued its seventh report of the season on cotton ginned from the American crop of 1914-1915. The figures cover the period from the beginning of the season up to December 13. The following table gives the returns by States, with comparisons for last year and for the large crop year, 1911:

COTTON GINNED FOR THE SEASON TO DECEMBER 13.

	1911, Bales.	1913, Bales.	1914, Bales.
Alabama	1,561,136	1,444,212	1,573,183
Arkansas	746,802	885,979	894,277
Florida	81,952	63,082	80,863
Georgia	2,517,857	2,215,308	2,452,790
Louisiana	340,304	391,454	415,533
Mississippi	996,601	1,084,680	1,085,002
North Carolina	913,944	708,598	766,673
Oklahoma	862,838	789,782	1,068,898
South Carolina	1,423,383	1,276,428	1,328,395
Tennessee	360,510	340,685	319,848
Texas	3,862,143	3,627,190	3,875,144
All others	103,257	100,030	116,583
United States	13,770,727	12,927,428	13,977,189

The amount of cotton ginned from December 1 to December 13 was 900,982 bales, as compared with 954,120 bales ginned in the same period in the season of 1911-1912, or 53,000 bales less. It must be borne in mind that the weather during the last ginning period was again unfavorable. Included in the figures for this year were 42,796 round bales (taken as half bales), as compared with 91,686 last year, 75,772 in 1912, and 93,294 in 1911. Sea Island cotton included amounted to 71,488 bales, compared with 69,520 bales last year, 60,445 bales in 1912, and 99,436 bales in 1911.

The average quantity of cotton ginned prior to December 1 in the last seven years was 11,482,722 bales, or 90.5 per cent of the average of the seven crops.

United States Cotton Standards Promulgated.—The official cotton standards of the United States were promulgated to-day by the Secretary of Agriculture in accordance with the provisions of the Cotton Futures Act. The new standard replaces the old official grades heretofore issued by the Department and must be used by the exchanges dealing in cotton futures after February 18. The standard covers the nine grades of cotton—Middling Fair, Strict Good Middling, Good Middling, Strict Middling, Middling, Strict Low Middling, Low Middling, Strict Good Ordinary and Good Ordinary. Copies of the standard will be prepared as rapidly as possible for sale at cost.

In filling orders for copies of these standards, the Department must, of necessity, take into consideration the extent to which the

applicant's business is affected by the operation of the United States Cotton Futures Act, and preference will necessarily be given to members of the future exchanges and to operators in the larger spot markets which may be bona fide spot markets for the purposes of the Futures Act. The law provides that the Secretary shall designate five or more such markets whose prevailing prices shall determine the differences between the values of the several grades in the settlement of future contracts. The Department, therefore, invites all parties who desire copies of these standards to communicate with the Chief of the Office of Markets.

The Cotton Goods Trade of Nanking, China.—The effect of the European War on the Nanking trade will be practically the same as that upon the trade of Shanghai, according to a recent report of Consul C. L. L. Williams, stationed at Nanking. (A full discussion of conditions in Shanghai and throughout China was contained in the issue of THE MARKET WORLD AND CHRONICLE for November 28.) The report of Mr. Williams, however, contains specific information with regard to the condition of the cotton goods trade at Nanking and is accordingly quoted in part:

"According to the returns of the Chinese Maritime Customs, the consumption of foreign imported goods in this district during 1913 amounted to $17,375,000. These figures do not include foreign goods imported by rail to Chinkiang or Nanking, which are but a small sum. Of the foregoing total, cotton piece goods, yarn and other cotton products contributed $6,350,000. Cotton piece goods and other cotton products, the most important imports, are handled exclusively through Shanghai. It is stated here that deliveries of British goods now being made are from stocks held in Shanghai or Hongkong, and that no fresh goods are arriving. As might be expected under such circumstances, British imports are said to be falling off, while the American are increasing. The future depends largely on manufacturing conditions in England, the safety of the trade routes between England and China, and other factors regarding which no information is to be had here. * * *

"The stock of piece goods in Nanking is very low, and prices are advancing with the Shanghai market. Of shirtings, the 7-9 pound and 9-11 pound grades appear to be most in demand. Imports of sheetings are comparatively small; such demand as exists is for the 11-pound and over grades. In drills the demand is chiefly for the 12¾-pound weights.

"India contributes about 50 per cent of the cotton yarn consumed; the balance is divided between Chinese and Japanese manufacturers, the former having a slight advantage. As Great Britain takes its share of the fancy goods trade, it is safe to say that under normal conditions British manufacturers form over two-thirds of the total trade in cotton goods."

NEW YORK QUOTATIONS FOR STANDARD COTTON GOODS AND YARNS

The following are quoted prices in the New York market for typical standard cotton goods (in cents per yard) and cotton yarns (in cents per pound) on Saturday of last week and on Wednesday of the present week:

Cloths.	Saturday.	Wednesday.
Print cloths, 28 in. 64 x 64s	2⅞	2⅞
Gray goods, 38 in., standard	3¾	3¾-3⅞
Brown sheetings, Southern standard	6¼-6½	6¼-6½
Denims, 9-ounce	12½-16	12½-16
Tickings, 8-ounce	12½	12
Standard prints	4½	4¼
Standard staple ginghams	6¼	6¼
Yarns.		
Southern 2-ply skeins, 30s	18-18½	17½-18
Southern 2-ply skeins, 60s	42	41
Southern single skeins, 20s	16	15½
Southern single chain warps, 20s	15½	15-15½
Southern 2-ply chain warps, 20s	16	15-15¼
Southern frame cones, 20s	16½-16¾	16-16¼
Southern frame cones, 30s	18-18½	17½-18
Eastern carded cops, 20s	18	18
Eastern carded cops, 30s	22½	22½
Eastern carded peeler warps, 30s	24½	24½
Eastern carded peeler warps, 56s	40	40

THE GRAIN AND PROVISION MARKETS
